Oil of Rho'dium. *Syn.* OLEUM RHODII, L. Said to be derived from the wood of species of *Rhodoriza*. Very fluid and limpid; pale yellow; soon darkens by age and exposure; tastes bitter and aromatic; has a modified odour of roses. Chiefly used as a substitute for otto of roses in cheap perfumery, and to adulterate it. Oil of sandal-wood is frequently sold for it. *Prod.* 1½ to 16½. See OIL OF ROSES (*below*).

Oil of Ro'ses. *Syn.* OLEUM ROSÆ, L. *Prep.*

1. From the petals of *Rosa sempervirens* (Linn.), or the musk rose, as oil of cloves, observing to keep the water in the worm-tub at 85° Fahr., and afterwards subjecting the water in the receiver to refrigeration. Resembles otto of roses, of which it is merely a variety. *Prod.* $\frac{1}{10}$ to $\frac{1}{5}$ of 1½.

2. (ATTAR OF ROSES, OTTO OF R.; OLEUM ROSÆ—Ph. E.) From the petals of *Rosa centifolia* and *Rosa sempervirens* (damask and musk rose), principally the first, by saturating the water, by returning it repeatedly on fresh flowers, and then exposing it to a low temperature. In the East Indies it is obtained by stratifying gingilly seeds in alternate layers with rose petals, for some days, and repeating the arrangement with fresh roses till the seeds are saturated, when the oil is expressed and distilled along with water. In the neighbourhood of Mecca the rose leaves are macerated in salt-and-water for 2 or 3 days, and then distilled, the water being received in separate receivers at different parts of the process. The water is afterwards exposed in porous earthenware vessels, tied over with linen, in trenches dug in the earth, and over which moistened straw is thrown, when in a short time the otto separates and floats on the surface.

Prop., &c. Colourless, or nearly so; odour intense, penetrating, and diffusive, and in a concentrated state far from pleasant, but when dilute very agreeable; taste, bland and sweetish; when pure, it congeals at 80°, and does not remelt until heated to fully 85° Fahr.; 1000 parts of alcohol of .806 dissolve only 7 parts of otto at 57° Fahr., and only 33 parts at 72°. Sp. gr. .832 at 90°, to water 1.000 at 60° Fahr. *Prod.* 100 lbs. of roses yield 2 to 3 dr.

Pur. Otto of roses is frequently adulterated with the oils of rhodium, sandal-wood, and geranium, and with camphor; and occasionally with spermaceti, to give the spurious compound the usual crystalline appearance. The following are reliable tests:—1. Pure otto has a bland, sweet taste; if it is bitter, it contains oil of rhodium or sandal-wood; if it is pun-

gent, or 'bites' the palate, it contains either oil of geranium or camphor, and probably both; if it imparts an unctuous sensation, it contains spermaceti.—2. Exposed for some hours to the fumes of a small quantity of iodide under a bell-glass in the cold, pure otto remains white, and continues so when exposed to the air; an adulterated sample, on the contrary, becomes yellow or brown, and afterwards, on exposure to the air, continues to darken in colour, until it becomes of a deep brown, or even perfectly black, according to the quantity of foreign oil present. A single drop may be thus tested.—3. (Guibourt.) One or two drops of the suspected oil are put into a watch-glass; the same number of drops of concentrated sulphuric acid are added, and the two fluids are mixed with a glass-rod. All the oils are rendered more or less brown by this proceeding; but, otto of roses retains the purity of its odour—oil of geranium acquires a strong and disagreeable odour, which is perfectly characteristic—the odour of the oil of rhodium is increased, and becomes somewhat unctuous, and, in general, it acquires an odour distinctly like that of cubebs.

Oil of Rosemary. *Syn.* ROSMARINI OLEUM (B. P.), OLEUM ANTHOS, O. ROSMARINI, O. ROSMARINI (Ph. L. E. & D.), O. ROSMARINI ESSENTIALE, L. From the flowering tops of *Rosmarinus officinalis*. In the Ph. L., English oil of rosemary (O. ROSMARINI, ANGLICUM) is ordered, as it is superior to that from abroad. Colourless; strongly fragrant, but scarcely agreeable unless compounded; carminative and stimulant. Boils at 365° Fahr. Sp. gr. .910; recent, .897; rectified, .8887. *Prod.* $\frac{1}{4}$ to $1\frac{1}{2}$ (nearly).

Pur., &c. It is frequently adulterated with oil of turpentine. When pure, it dissolves in all proportions in spirit of .830. By age it deposits a crystalline stearoptene, and acquires a terebinthinate odour. It is chiefly used as a stimulant in liniments, hair oil, pomatums, &c.

Oil of Rose'wort. *Syn.* OIL OF ROSE-ROOT; OLEUM RHODIOLÆ, L. From the roots of *Rhodiola rosea*. Yellowish; odour resembles that of oil of rhodium, for which it is often sold, as well as the distilled water for rose water. $1\frac{1}{2}$ lb. yields about 1 dr.

Oil of Rue. *Syn.* RUTÆ OLEUM (B. P.), OLEUM RUTÆ (Ph. L. & E.), L. The "oil distilled from the fresh herb of *Ruta graveolens*," (B. P.), or common rue. Pale yellow, turning brown by age, and depositing a brownish, resinous sediment; congeals at about 40° Fahr.; acrid, bitter; odour that of the plant; stimulant, antispasmodic, and emmenagogue. Sp. gr. .909 to .911. *Prod.* $\frac{1}{4}$ to $1\frac{1}{2}$ (nearly). According to Raybaud, the recent dried seeds yield fully four times as much oil as the flowering herb.

Pur. Nearly always adulterated. When pure—1. It forms a clear solution with rectified spirit.—2. It does not form a camphor

with gaseous hydrochloric acid.—3. Iodine dissolves in it slowly, without any apparent reaction, beyond a darkening and a slight increase of viscosity.—4. It is unaffected by a solution of chromate of potassa.—5. Nitric acid very slowly changes it into a greenish-yellow liquid balsam.—6. If it forms a reddish-brown solution with liquor of potassa and a still darker one with oil of vitriol, or if it fulminates with iodine, it is adulterated with the oil of some labiate plant.—7. It is more soluble in both rectified spirit and water than any of the oils used to adulterate it.

Oil of Saffron. *Syn.* OLEUM CROCI, L. From the pistils of *Crocus sativus* (saffron). Yellow; heavier than water; acrid, pungent, and narcotic; decomposed by exposure to light and age, with the formation of a white solid matter, which is lighter than water.

Oil of Sage. *Syn.* OLEUM SALVIÆ, L. From the herbaceous portion of *Salvia officinalis*, or common sage.

Oil of Sand'al-wood. *Syn.* OLEUM SANTALI, O. S. ALBI, L. From the wood of *Santalum album*, or sandal-tree, and preferably from that of Malabar. It has an odour somewhat resembling that of oil of rhodium, for which it is commonly used; also used to adulterate otto of roses. *Prod.* 9 lbs. yield 1 oz.; 100 lbs. yield 5 oz. (Raybaud).

Oil of Sarsaparilla. *Syn.* OLEUM SARZÆ, L. From the root bark, distilled along with salt-and-water. Acrid; odour and flavour same as the root.

Oil of Sas'safras. *Syn.* VOLATILE OIL OF S.; OLEUM SASSAFRAS (Ph. E.), O. LAURI S., O. S. OFFICINALIS, L. From bruised sassafras chips, the sliced root of *Sassafras officinale*, as oil of cloves. Pale yellow; highly odorous; hot, pungent, rubefacient, and stimulant; reputed alterative, sudorific, and diuretic, and, as such, occasionally given in rheumatism, cutaneous affections, &c. Sp. gr. 1.094 to 1.096. *Prod.* $1\frac{1}{2}$ to 2½ (fully).

Pur., &c.—1. If the density is lower than 1.094, it is adulterated.—2. Nitric acid acts on this oil, at first slowly, merely turning it of an orange-red, but afterwards with violence, and a reddish-brown resin is formed.—3. Mixed with about one half its weight of sulphuric acid, a green colour is at first developed, which, by heat, is changed to a blood-red. A large quantity of sulphuric acid acts at once violently, white fumes are given off, and mere charcoal is left.—4. With iodine it forms a permanently clear solution, or at least one that remains so for some time.—5. By agitation with water, it separates into two oils—one lighter, the other heavier, than that fluid.

Oil of Sav'ine. *Syn.* OLEUM SABINÆ (B. P.), OLEUM JUNIPERI SABINÆ, O. SABINÆ (Ph. E. & D.), L. From the fresh tops or leaves of *Juniperus sabina*, or common savin. Pale yellow; limpid; acrid, pungent, and stimulant. It possesses the general properties of the plant in a highly exalted degree. Sp. gr.

·915. *Prod.* Fresh herb, 1·25 to 1·5 $\frac{1}{2}$; dried do. (recent), 2 $\frac{1}{2}$ to 3 $\frac{1}{2}$. *Dose.* 2 to 6 drops; as an anthelmintic, diaphoretic, and emmenagogue. Its use must be carefully avoided during pregnancy or disease of the abdominal viscera.

Pur., &c. It is less frequently adulterated than the other volatile oils. Its high sp. gr. and free solubility in rectified spirit offer the means of detecting the presence of either oil of turpentine or alcohol, the substances occasionally added to it. A mixture of equal parts of oil of savin and oil of vitriol, by distillation from milk of lime, furnishes an oil apparently identical with oil of thyme. (Winckler.)

Oil of Sen'na. *Syn.* OLEUM SENNÆ VOLATILE, L. Possesses the nauseous odour and flavour of the leaves, and, as well as the distilled water, is purgative.

Oil of Spearmint. *Syn.* ENGLISH OIL OF SPEARMINT (B. P.), OIL OF MINT, OIL OF GREEN M.; MENTHÆ VIRIDIS OLEUM (B. P.); OLEUM MENTHÆ VIRIDIS (Ph. L. E. & D.), O. M. SATTIÆ, O. ESSENTIALE MENTHÆ S., L. From the fresh flowering herb of *Mentha viridis* (Linn.), or garden or spearmint. Pale yellow; reddened by age; odour and general properties resemble those of oil of peppermint, but it is less grateful. It boils at 320° Fahr. Sp. gr. ·915 (·9394, Brande). *Prod.* ·2 $\frac{1}{2}$ to ·25 $\frac{1}{2}$. Its common adulterants are alcohol and oil of turpentine.

Oil of Spike (True). *Syn.* FOREIGN OIL OF LAVENDER; OLEUM SPICE, O. S. VERUM, O. STÆCHADIS, O. LAVANDULÆ S., L.; HUILE D'ASPIQ, Fr. Chiefly from *Lavandula spica* and *L. Stæchas*, or French and Alpine lavers. It differs from English oil of lavender by its darker green colour and inferior odour. From France. *Used* by artists to mix their colours in, and to make varnishes. Oil of turpentine scented with lavender is commonly sold for it. *Prod.* From *L. spica* (fresh), $\frac{3}{4}$ to 1 $\frac{1}{2}$; *L. Stæchas* (dried), $\frac{3}{4}$ to 1 $\frac{1}{2}$ (fully).

Oil of Spike'nard. *Syn.* OLEUM NARDI, L. The precious oil mentioned under this name in Scripture is supposed to have been derived from *Andropogon Iwarancusa*. The commercial oil of geranium (see *above*) is also called by this name.

Oil of Spring Grass. *Syn.* OLEUM ANTHOX-ANTHI ODORATI, L. From *Anthoxanthum odoratum*, or sweet-scented vernal grass. It is this oil gives the very agreeable odour to new hay.

Oil of Star-an'ise. *Syn.* BADIANI OIL; OLEUM BADIANI, O. ANISI STELLATI, L. From the capsules of *Illicium anisatum*, or star-anise. It continues liquid at 35 $\frac{1}{2}$ ° Fahr. This, and its weaker reaction with iodine, distinguish it from the preceding compound, which it is commonly used to adulterate. *Prod.* 2 $\frac{1}{2}$ (fully).

Oil of Sweet Fen'nel. See OIL OF FENNEL.

Oil of Sweet Flag. *Syn.* OLEUM ACORI, O. A. AROMATICA, L. From the rhizomes or roots of *Acorus Calamus* (Linn.), or sweet flag.

Yellow; agreeably fragrant. *Used* to scent snuff, aromatic vinegar, &c. *Prod.* Fresh rhizomes, $\frac{3}{4}$ to 1 $\frac{1}{2}$; dried (recent), 1 to 1·25°.

Oil of Tan'sy. *Syn.* OLEUM TANACETI, L. From the flowering herb of *Tanacetum vulgare* (Linn.), or tansy. Pale greenish-yellow; very odorous; bitter; aromatic. Sp. gr. ·946 to ·950. *Prod.* Fresh, ·25 to 5 $\frac{1}{2}$; dried (recent), $\frac{3}{4}$ to 1 $\frac{1}{2}$ (fully).

Oil of Thyme. *Syn.* OLEUM THYMI; OIL OF ORIGANUM, OLEUM ORIGANI (of the shops). From the flowering herb of *Thymus vulgaris* (Linn.), or garden thyme. Nearly colourless; the imported oil has a reddish colour, which it loses by rectification; very fragrant; acrid, hot tasted, stimulant, and rubefacient; boils at 354° Fahr. Sp. gr. ·867 to ·875. *Prod.* ·5 $\frac{1}{2}$ to ·75 $\frac{1}{2}$.

Obs. This is the dark-coloured 'OIL OF ORIGANUM' of the shops. It is frequently adulterated with oil of turpentine. It is occasionally used in toothache and in stimulating liniments; but its chief consumption is in perfumery, more particularly for hair-oils, pomatums, and hair-washes, as it is reputed to make the hair grow and to prevent baldness.

Oil of Tobac'co (Volatile). From the leaves of *Nicotiana tabacum* (Linn.), or the tobacco plant. Concrete.

Oil of Turpentine. *Syn.* SPIRIT OF T., ESSENCE OF T., TURPS, CAMPHENE, CAMPHINE; TEREBINTHINÆ OLEUM (B. P.), SPIRITUS TEREBINTHINÆ, ESSENTIA T., OLEUM TEREBINTHINÆ (Ph. L. & D.), O. T. PURIFICATUM (Ph. E.), L. The oil of turpentine of commerce is obtained by distilling strained American turpentine along with water. The residuum in the still is 'resin' or 'rosin.' The product in oil varies from 14 $\frac{3}{4}$ to 16 $\frac{3}{4}$. The Colleges order it to be rectified before being employed for medicinal purposes. This is effected by re-distilling it along with 3 or 4 times its volume of water, observing not to draw over quite the whole. The portion remaining in the retort (balsam of turpentine) is viscid and resinous. A better plan is to well agitate it with an equal measure of solution of potassa or milk of lime before rectifying it. This is the plan adopted for the camphine used for lamps. By agitating crude oil of turpentine with about 5 $\frac{1}{2}$ of sulphuric acid, diluted with twice its weight of water, and after repose and decantation rectifying $\frac{3}{4}$ from 5 or 6 times its volume of the strongest lime water, a very pure and nearly scentless oil may be obtained. Dr. Nimmo recommends oil of turpentine to be purified by agitation with $\frac{1}{4}$ th part of rectified spirit, after repose to decant the spirit, and to repeat the process 3 or 4 times. The product retains, however, fully $\frac{1}{4}$ th part of spirit in solution, and hence this method is objectionable, except for medicinal purposes, for which, according to Dr. Garrod, it is better than the oil purified by rectification. The sweet spirits of turpentine (SPIRITUS TEREBINTHINÆ DULCIS), vended of

late years in the shops, is simply the common oil which has been agitated with, and rectified from, somewhat dilute sulphuric acid.

Prop. Pure oil of turpentine is colourless; limpid; very mobile; neutral to test-paper; has an odour neither powerful nor disagreeable when recently prepared, but becoming so by exposure to the air; dissolves $\frac{3}{4}$ th part of alcohol of '830; is soluble in 6 parts of ether and in $7\frac{1}{2}$ parts of rectified spirit; hot strong alcohol dissolves it freely, but the greater part separates in globules as the liquid cools. Oil of vitriol chars it, and strong nitric acid attacks it violently, even with flame. It congeals at 14° , and boils at 312° Fahr. Sp. gr. '867; that of the oil of the shops varies from '872 to '878. It possesses a very high refractive power. At 72° it absorbs 163 times its volume of hydrochloric-acid gas (if kept cool), and in 24 hours from $26\frac{1}{2}$ to $47\frac{1}{2}$ of crystals (KIND'S CAMPHOR) separate. These have a camphoraceous odour, and, after being washed with water, and sublimed along with some dry chalk, lime, or charcoal, assume the form of a white, translucent, flexible, crystalline mass, which is volatile, soluble in alcohol, and possesses a considerable resemblance to camphor. A nearly similar substance is produced by the action of oxygen gas on oil of turpentine.

Uses, &c. Oil of turpentine is extensively used in the manufacture of varnishes and paints. Under the name of 'camphine,' it is occasionally employed for burning in lamps. For the last purpose it must be newly rectified and preserved from the air. By exposure, it rapidly absorbs oxygen, resin is formed, its density increases, and it gives a dull fuliginous flame. In medicine, it is employed as a diaphoretic, stimulant, vermifuge, &c.—*Dose.* 6 to 30 or 40 drops; in rheumatism, hemicrania, &c., 1 fl. dr. every four hours, in combination with bark or capsicum; in tape-worm, 3 fl. dr. to 1 fl. oz., either alone or combined with a little syrup of orange peel, every 8 hours, until the worm is expelled. The common symptoms of large doses of this oil are dizziness and a species of temporary intoxication, and occasionally nausea and sickness, which subside after two or three alvine evacuations, leaving no other effect, when the oil is pure, than a certain degree of languor for a few hours. In tape-worm, a little castor-oil may be advantageously combined with the second and subsequent doses. Oil of turpentine imparts a violent odour to the urine. To prevent loss by evaporation and resinification, this oil should be kept in tin cans or glass bottles. For store vessels, closely covered tin cisterns are the best. To prevent accidents, it is proper to caution the operator of the extremely penetrating and inflammable nature of the vapour of this oil, even in the cold. During the process of its distillation, without the greatest precautions are taken, an explosion is almost inevitable.

Oil of Vale'rian. *Syn.* OLEUM VALERIANÆ (Ph. Bor.), L. From the root of *Valeriana officinalis* (Linn.), or wild valerian. Yellowish; viscid; lighter than water; smells strongly of the plant. By exposure to the air, it is partly converted into valerianic acid, and more readily so under the influence of an alkali. In its usual form it consists of valerol, a neutral oily body; borneene, a volatile liquid hydrocarbon; and valerianic acid. It is powerfully antispasmodic, emmenagogue, tonic, and stimulant, and, in large doses, narcotic.—*Dose.* $\frac{2}{3}$ to 6 drops; in epilepsy, hysteria, hemicrania, hypochondriasis, low fevers, &c. *Prod.* $1\frac{1}{2}$ to $2\frac{1}{2}$ (nearly).

Oil of Verbena. *Syn.* OLEUM VERBENÆ, L. From the fresh flowering herb of *Verbena odorata*. *Prod.* $2\frac{1}{2}$ to $5\frac{1}{2}$. The 'OIL OF VERBENA' of the shops is imported from India, and is obtained from *Andropogon citratus*. See OIL OF LEMON GRASS.

Oil of Wine. *Syn.* HEAVY OIL OF WINE, ETHERAL OIL, OILY ETHERAL LIQUOR, SULPHATE OF ETHER AND ETHEROLE; OLEUM ETHERIUM (Ph. L.), OLEUM VINI, LIQUOR ETHEREUS OLEOSTUS, L. This is an artificial production which, for convenience, may be included under this head.

1. (Ph. L.) Rectified spirit, 2 pints, and sulphuric acid, 36 fl. oz., are cautiously mixed together in a glass retort, and submitted to distillation until a black froth appears, when the retort is immediately removed from the fire (and heat); the lighter, supernatant liquor is next separated from the fluid in the receiver, and exposed to the air for 24 hours; it is then agitated with a mixture of solution of potassa and water, of each, 1 fl. oz., or q. s., and, when sufficiently washed, is, lastly, separated from the aqueous liquid from which it has subsided. The formula of the Ph. L. 1836 is nearly similar.

2. (Ph. D.) Rectified spirit and oil of vitriol (commercial), of each, $1\frac{1}{2}$ pint; as the last, employing a Liebig's condenser, and a capsule for the exposure to the air; the oil is then transferred to a moistened paper filter, and washed with a little cold water, to remove any adhering acid.

3. (Ph. D. 1826.) From the residuum in the retort after the process of preparing ether, distilled to one half, by a moderate heat, and the oil treated as before.

4. From rectified spirit (sp. gr. '833), 2 parts; oil of vitriol, 5 parts; mix and distil, as before; wash the product with distilled water, and free it from adhering water and undecomposed alcohol by exposure in the vacuum of an air-pump, between two open capsules, the one containing fragments of solid potassa, and the other concentrated sulphuric acid. Pure.

5. By distilling a mixture of ether and oil of vitriol, and treating the product as before.

6. By the destructive distillation of dry sulphovinate of calcium; the product is freed

from alcohol, &c., by washing it. This process yield the largest product.

Prop., &c. An oily liquid, nearly colourless, neutral, with an aromatic taste, and an odour resembling that of oil of peppermint. It is insoluble in water, but freely soluble in both alcohol and ether; boiling water converts it into sulphovinic acid, and a volatile liquid called light or sweet oil of wine; with an alkaline solution, this effect is produced with even greater facility. Sp. gr. 1.05 (Hennel & Ph. L.); 1.13 (Serullas). Boils at 540° Fahr. "Dropped into water, it sinks, the form of the globule being preserved." (Ph. L.) *Prod.* 1.25 to 1.55; 33 lbs. of rectified spirit, and 64 lbs. of oil of vitriol, yield 17 oz. of this oil (Hennel).

Uses. Oil of wine is reputed anodyne, but is only used in the preparation of other compounds. See SPIRIT OF ETHER (Compound), &c.

Oil of Wine (Light). *Syn.* SWEET OIL OF WINE. See ETHERIN, ETHEROLE, and *above*.

Wood Oil (of India). From the *Chloroxylon Swietenia* (De Cand.), the tree which yields the satin-wood of the cabinet-makers. Another wood oil (GURJUN BALSAM) is obtained by incision from various species of *Dipterocarpus*. This balsam yields about 38% of a volatile oil by distillation, which in its general properties closely resembles OIL OF COPAIBA. (O'Shaughnessy.)

Oil of Wormseed. *Syn.* OLEUM CHENOPODII (Ph. U. S.), L. From the seeds of *Chenopodium anthelminticum*, or Jerusalem oak (American wormseed). Light yellow, or greenish; powerfully anthelmintic. Sp. gr. .908.—*Dose.* For an adult, 25 to 30 drops, in sugar, honey, or milk, night and morning, for 3 or 4 days, followed by a good dose of castor oil, or some other suitable purgative.

Oil of Wormwood. *Syn.* OLEUM ABSINTHII, L. From the herbaceous portion of *Artemisia Absinthium*, or common wormwood; green or brownish-green; odorous; acrid; bitter; stomachic. Sp. gr. .9703 (Brisson); .9720 (Pereira); .9725 (Brande). *Prod.* Fresh herb (picked), $\frac{1}{4}$ to $\frac{3}{4}$ lb.; dry herb (a year old), $\frac{1}{2}$ lb. (fully); do. (recent), $\frac{3}{4}$ to 1 lb. (fully).

Par. That of the shops is nearly always either adulterated or partly spoiled by age; hence the discrepancies in the densities given for this oil by different authorities. A specimen of this oil distilled by Mr. Cooley from the green plant had the sp. gr. .9712; but after being kept for 12 months, it had increased to .9718. Nitric acid of 1.25 colours the pure oil first green, then blue, and, lastly, brown. The positive character of these reactions is in direct proportion to the purity and freshness of the sample.

OILY EMULSION. See LINOTUS (Emollient).

OILY ETHERAL LIQUOR. See OIL OF WINE (*above*).

OINTMENT. *Syn.* UNGUENTUM, L. Any soft, fatty substance applied to the skin by

unction. The term is now commonly restricted to those which are employed in medicine.

Ointments (unguenta) differ from 'cerates' chiefly in their consistence, and in wax not being a constant or essential constituent; and they are made and used in a nearly similar manner to that class of preparations. Their proper degree of solidity is that of good butter, at the ordinary temperature of the atmosphere. When the active ingredients are pulverulent substances, nothing can be more suitable to form the body of the ointment than good fresh lard, free from salt; but when they are fluid or semi-fluid, prepared suet, or a mixture of suet and lard, will be necessary to give a due consistence to the compound. In some instances wax is ordered for this purpose. Another excellent 'vehicle' for the more active ingredients is a simple ointment, formed by melting together 1 part of pure white wax with about 4 parts of olive oil. The use of the last excludes the possibility of the irritation sometimes occasioned by the accession of rancidity, when inferior lard is employed. In a few cases butter is employed to form the body of the ointment.

Some ointments are made from recent vegetable substances by infusion or coction, in the manner adopted for medicated oils. See OILS, MEDICATED.

The precautions to be used in the choice of lard are noticed in the article devoted to this substance. Lard is included in the *Materia Medica* of the London College. In the last Ph. D. lard for medicinal use (ADIPS STILLUS PREPARATUS—Ph. D.) is ordered to be prepared by melting it in twice its weight of boiling water, stirring it constantly for some time, then setting the mixture aside to cool; and, lastly, separating the fat when it has solidified.

Ointments are best preserved by keeping them in salt-glazed earthen or stoneware jars, covered with tin foil, in a cool situation.

The accession of rancidity in ointments and other unctuous preparations may be greatly retarded, if not wholly prevented, by previously dissolving in the fat about 2% of gum-benzoin, in fine powder, or rather less quantity of benzoic acid, by the aid of heat. This addition renders the ointment peculiarly soothing to irritable or highly sensitive skins. Poplar buds act in a similar manner.

*** The formulas for all the more useful and generally employed ointments are given below. Those not included in the list may be prepared of the proper strength for all ordinary purposes, by combining about 12 to 15 times the medium dose of the particular medicinal with 1 oz. of lard or simple ointment. For substances which possess little activity, $\frac{1}{2}$ to 1 dr. per oz., or even more, may be taken. See CERATE, FAT, &c.

Ointment of Acetate of Lead. *Syn.* UNGUENTUM PLUMBI ACETATIS (B. P., Ph. E. & D.), L. *Prep.* 1. (Ph. E.) Acetate of lead, in fine powder, 1 oz.; simple ointment, 20 oz.; mix them thoroughly (by trituration).

2. (Ph. D.) Ointment of white wax, 1 lb.; melt by a gentle heat, then add, gradually, of acetate of lead, in very fine powder, 1 oz., and stir the mixture until it concretes.

3. (B. P.) Acetate of lead, in fine powder, 12 grs.; benzoated lard, 1 oz.; mix.

Obs. A useful, cooling, astringent, and desiccative ointment. For the formula of Ph. L., see CERATE.

Ointment, Acetic. See VINEGAR OINTMENT.

Ointment of Aconite. *Syn.* UNGUENTUM ACONITI, L. *Prep.* 1. (Dr. Turnbull.) Alcoholic extract of aconite, 1 part; lard, 2 parts; carefully triturated together. In neuralgia, &c.

2. (Ammoniated; UNGUENTUM ACONITIAMONIATUM—Turnbull.) Ammoniated extract of aconite, 1 part; lard, 3 parts. In neuralgia, paralysis, old rheumatic affections, &c. The use of the above preparations of aconite requires the greatest caution. They are intended as substitutes for OINTMENT OF ACONITINE, a still more dangerous preparation.

Ointment of Aconitine. *Syn.* UNGUENTUM ACONITINÆ, L. *Prep.* 1. (Dr. Garrod.) Pure aconitine, 1 gr.; lard, 1 dr.; mix by careful trituration.

2. (Dr. Turnbull.) Aconitine, 2 grs.; rectified spirit, 6 or 7 drops; triturate together, then add of lard, 1 dr., and mix well.

3. (B. P.) Aconitia (aconitine), 8 grs.; rectified spirit, $\frac{1}{2}$ dr.; dissolve and add lard, 1 oz.; mix.

Use, &c. As a topical benumbant in neuralgic affections, rheumatic pains, &c. Its application generally occasions considerable tingling, and sometimes redness of the part to which it is applied, followed by temporary loss of sensation in the skin and the cessation of the pain. For slight cases Dr. Paris formerly employed only 1 gr. to the oz. Owing to the intensely poisonous nature of aconitine, this ointment must be both prepared and used with great caution, and must never be applied to an abraded surface. It is seldom employed, owing to its extreme costliness. See ACONITINE, and *above*.

Ointment, Ague. See ANTI-PERIODIC OINTMENT.

Ointment, Albinolo's. See PATENT MEDICINES.

Ointment, Alkaline. *Syn.* UNGUENTUM ALKALINUM, L. *Prep.* 1. (Biett.) Carbonate of soda, 2 drs.; fresh-slaked lime, 1 dr.; powdered opium, 2 grs.; lard, 2 oz.; mix by trituration. In prurigo, ringworm, and some other cutaneous affections.

2. (Cazenave.) Carbonate of potassa, 1 dr.; lard, 1 oz. In psoriasis, lepra, and scorbutic eruptions.

3. (Devergie).—*a.* From carbonate (not sesquicarbonate) of soda, 10 to 15 grs.; lard, 1 oz. In lichen.

b. From carbonate of soda, 20 to 30 grs.; lard, 1 oz. In ichthyosis, lepra, psoriasis, and some other scaly skin diseases.

c. From carbonate of soda, $\frac{1}{2}$ to 1 dr.; lard, 1 oz. In porrigo favosa, especially when occurring in adults.

4. (Soubéiran.) Carbonate of soda, 1 to 2 drs.; wine of opium, 1 fl. dr.; lard, 1 oz. In any of the above affections, when there is much pain or irritation.

Obs. Carbonate of potassa is thought to be preferable to carbonate of soda, when the above affections occur in scorbutic habits. A little camphor is also occasionally added.

Ointment of Alum. *Syn.* UNGUENTUM ALUMINIS, L. *Prep.* 1. Alum, in very fine powder, 1 dr.; lard, $1\frac{1}{2}$ oz. In piles.

2. To the last add of powdered opium, 7 grs. In piles, when there is much pain. See BANYER'S OINTMENT.

Ointment, Ammoniacal. *Syn.* UNGUENTUM AMMONIACALE, U. AMMONIÆ, L.; LIPAROLE D'AMMONIAQUE, POMMADE DE GONDRET, Fr. *Prep.* 1. (P. Cod.) Suet and lard, of each, 1 oz.; melt in a strong wide-mouthed bottle, add of liquor of ammonia (sp. gr. .923), 2 oz., at once close the bottle, and agitate it until its contents concrete. As little heat as possible should be employed, to prevent unnecessary loss of ammonia.

2. (Gondret.) Lard, 3 parts; suet, 2 parts; almond oil, 1 part; strong solution of ammonia, 6 parts; mix, as before. Rubefacient, vesicant, and counter-irritant. Smear over the skin and covered so as to prevent evaporation, it raises a blister in 5 or 6 minutes. Its general effects and uses are similar to those of compound liniment of ammonia.

Ointment of Carbonate of Ammonia. *Syn.* UNGUENTUM AMMONIÆ CARBONATIS, U. A. SESQUICARBONATIS, L. *Prep.* From carbonate of ammonia, 1 dr.; lard, 9 drs. An excellent application to painful joints, indolent tumours, scrofulous sores, &c.

Ointment of Ammoniated Mercury. *Syn.* UNGUENTUM HYDRARGYRI AMMONIATUM (B. P.). Ammoniated mercury, 62 grs.; simple ointment, 1 oz., mix. See next preparation.

Ointment of Ammonio-chloride of Mercury. *Syn.* WHITE PRECIPITATE OINTMENT; UNGUENTUM HYDRARGYRI AMMONIO-CHLORIDI (Ph. L.), U. H. PRECIPITATI ALBI, U. PRECIP. A. (Ph. E.), U. H. SUBMURIATIS AMMONIATI (Ph. D. 1826), L. *Prep.* 1. (Ph. L.) Ammonio-chloride of mercury, 2 drs.; lard, 3 oz.; triturate together.

2. (Ph. E.) As the last, but employing heat.

Uses, &c. Alterative; detergent; stimulant. In itch, scald-head, and various other skin diseases; in inflammation of the eyes; as an application to scrofulous and cancerous tumours; to destroy vermin on the body, &c. It "may be safely used" (in small quantities) "on infants." (A. T. Thomson.)

Ointment, An'glo-Saxon. *Prep.* Heat olive oil, 1 pint, and bees' wax, $\frac{1}{4}$ lb., until the mixture acquires a reddish-brown colour; then add red lead (levigated), $\frac{1}{4}$ lb., and continue

the heat, with constant stirring; when the union appears complete, add of amber and burnt alum, of each, in fine powder, $\frac{1}{2}$ oz.; lastly, when considerably cooled, add of powdered camphor, 3 drs. As a dressing to foul ulcers.

Ointment, An'odyne. See OINTMENT OF OPIUM, HEMLOCK, &c.

Ointment of An'thracoka'li. *Syn.* POMMADE DE ANTHRACOKALI, Fr. *Prep.* (Dr. Polya.) Anthracokali, in very fine powder, 1 part; lard, 30 parts. See ANTHRACOKALI.

Ointment, Antitherpetic. *Syn.* UNGUENTUM ANTITHERPETICUM, L. *Prep.* 1. (Alibert.) Red sulphide of mercury, 3 drs.; powdered camphor, 1 dr.; lard, 3 oz.

2. (Chevallier.) 'Subsulphate of mercury' (Turpeth mineral), 2 drs.; chloride of lime, 3 drs.; almond oil, 6 drs.; lard, 2 oz. In herpes or tetters.

Ointment, Antimo'nial. See OINTMENT OF POTASSIO-TARTRATE OF ANTIMONY.

Ointment, Antiperiod'ic. *Syn.* AGUE OINTMENT; UNGUENTUM ANTIPERIODICUM, U. FEBRIFUGUM, L. *Prep.* 1. Disulphate of quinine, $1\frac{1}{2}$ dr.; saccharine carbonate of iron, 1 dr.; oil of cajeput, 30 drops; fresh butter, 1 oz.

2. (Antonini.) Sulphate of quinine, 1 oz.; rectified spirit and sulphuric acid, of each, q. s. lard, 4 oz.

Uses, &c. About $\frac{1}{2}$ oz. of either of the above to be rubbed on the vertebral regions once every 2 or 3 hours for 3 or 4 days, in intermittent fevers, more especially in those accompanied by vomiting; or, into the epigastrium, in cholera, diarrhoea, or dysentery.

Ointment, Aromatic. *Syn.* BALSAMUM STOMACHALE WACKERI, UNGUENTUM AROMATICUM, L. *Prep.* (Ph. Austr. 1836.) Simple ointment, $2\frac{1}{2}$ lbs.; yellow wax and oil of laurel, of each, 3 oz.; melt together, and, when considerably cooled, add of oils of juniper, mint, lavender, and rosemary, of each, 2 drs. Anodyne, balsamic, and stimulant.

Ointment, Arsen'ical. *Syn.* OINTMENT OF WHITE ARSENIC; UNGUENTUM ARSENICALE, U. ARSENICI, U. ACIDI ARSENIOSI, L. *Prep.* 1. Arsenious acid (levigated), 3 grs.; lard or simple ointment, 1 oz. In lepra, psoriasis, malignant whitlows, &c.

2. (Hosp. F.) Levigated white arsenic, 15 to 20 grs.; lard, 1 oz. As a dressing for cancerous sores.

3. (Soubeiran.) White arsenic, 1 dr.; lard and spermaceti ointment, of each, 6 drs. In malignant cancer. The above must be carefully prepared, and used with great caution. See CERATE.

Ointment of Arse'niate of Iron. *Syn.* UNGUENTUM FERRI ARSENIATIS, L. *Prep.* 1. (Carmichael.) Arseniate of iron, $\frac{1}{2}$ dr.; phosphate of iron, 2 drs.; spermaceti ointment, 6 drs.

2. (Dr. Pereira.) Arseniate of iron, $\frac{1}{2}$ dr.; lard, $1\frac{1}{2}$ oz. In cancer.

Ointment, Astrin'gent. *Syn.* UNGUENTUM ASTRINGENS, L. *Prep.* Triturate powdered catechu, $1\frac{1}{2}$ dr., with boiling water, 2 fl. drs., add, gradually, of spermaceti ointment (melted), $1\frac{1}{2}$ oz., and continue the trituration until the mass concretes. An excellent dressing for ill-disposed sores and ulcers, especially during hot weather. See the several LEAD OINTMENTS, OINTMENT OF GALLS, &c.

Ointment of Atro'pia. *Syn.* UNGUENTUM ATROPIÆ (B. P.), L. *Prep.* 1. Atropia, $1\frac{1}{2}$ gr.; simple ointment, 1 dr.; mix by careful trituration.

2. (Dr. Brookes.) Atropia, 5 grs.; lard, 3 drs.; otto of roses, 1 drop. In neuralgia, rheumatic pains, &c., when the affection is not deeply seated.

3. (B. P.) Atropia, 8 grs.; rectified spirit, $\frac{1}{2}$ dr.; lard, 1 oz.; dissolve the atropia in the spirit and mix with the lard.

Ointment, Bailey's. See ITCH OINTMENT.

Oil of Bal'sam of Peru. *Syn.* UNGUENTUM BALSAMI PERUVIANI, L. *Prep.* 1. Lard or spermaceti ointment, 1 oz.; balsam of Peru, 1 dr.; melt together by the heat of boiling water, stir for 5 or 6 minutes, allow it to settle, and pour off the clear portion. In chaps and abrasions.

2. (Compound; UNG. B. P. COMPOSITUM—Copland.) Lard, 1 oz.; white wax, $\frac{1}{4}$ oz.; balsam of Peru, 1 dr.; melt as before, and when nearly cold, add of oil of lavender, 10 or 12 drops. As the last, and to restore the hair.

Ointment, Banyer's. *Syn.* COMPOUND ALUM OINTMENT; UNGUENTUM ALUMINIS COMPOSITUM, U. CALOMELANOS, U. BANYERI, L. *Prep.* From burnt alum and calomel, of each, $1\frac{1}{2}$ oz.; carbonate of lead or litharge (levigated), 2 oz.; Venice turpentine, $\frac{3}{4}$ lb.; lard, 2 lbs.; carefully triturated together. In milk-scald, porrigo, &c.

Ointment of Bark. See OINTMENT OF CINCHONA.

Ointment, Basil'con. *Syn.* BASILICON, YELLOW B.; UNGUENTUM BASILICUM; U. B. FLAVUM, L. *Prep.* (Ph. L. 1746.) Olive oil, 16 fl. oz.; yellow wax, yellow resin, and Burgundy pitch, of each, 1 lb.; melt, remove the vessel from the fire, and stir in of common turpentine, 3 oz. This form is still occasionally employed in some shops, but is generally superseded by the resin cerate and resin ointment of the Pharmacopœias. A nearly similar preparation, under the name of 'basilicon ointment,' is contained in the Ph. Bor. 1847. (See below.)

Ointment, Basilicon (Black). See OINTMENT OF PITCH.

Ointment, Basilicon (Green). *Syn.* UNGUENTUM BASILICUM VIRIDE, L. *Prep.* (Ph. L. 1746.) Prepared verdigris, 1 oz.; yellow basilicon, 8 oz.; olive oil, 3 fl. oz. Detergent. Used to keep down fungous growths, to dress syphilitic ulcers, &c. See CERATE and OINTMENT OF VERDIGRIS.

Ointment, Bateman's. See ITCH OINTMENT.
Ointment of Bay-leaves. See LAUREL OINTMENT.

Ointment of Belladonna. *Syn.* UNGUENTUM BELLADONNÆ (B. P., Ph. L.). *Prep.* 1. (Ph. L.). Extract of belladonna (deadly nightshade), 1 dr.; lard, 1 oz.; mix by trituration.

2. (Soubeiran.) Fresh belladonna leaves (bruised), 1 part; lard, 2 parts; simmer together until the leaves become crisp, and, after digestion for a short time longer, drain with pressure.

3. (B. P.). Extract of belladonna, 1; rubbed with a few drops of water, and mix with lard, 5½.

Uses, &c. As a local anodyne, in painful and indolent tumours, nervous irritations, &c. Also as an application to the neck of the uterus in cases of rigidity. (Chaussier.)

4. (Compound; UNGUENTUM BELLADONNÆ COMPOSITUM, L.)—*a.* (W. Cooley.) Compound iodine ointment, 7 drs.; extract of belladonna, 1 dr. Powerfully discutient. A most excellent application to all glandular tumours and indurations, buboes, &c., which it is desirable to disperse instead of mature, more especially when there is much pain. It is particularly suitable to cases occurring on shipboard, and when its application (at least twice a day) is accompanied with the internal use of the mixture of iodine and gold (see ANTISCROFULOUS MIXTURE), this treatment has seldom failed, even when the parties were dieted chiefly on salt food.

b. (Debreyne.) Extract of belladonna and lard, of each, 3 drs.; powdered opium, ½ dr. As an external anodyne and benumbant, more especially in neuralgia, painful cancerous tumours, &c. A small piece is to be applied to the part, and the friction continued for 6 or 8 minutes. The above preparations are useless unless the extract employed is recent, and of good quality.

Ointment of Bismuth. *Syn.* UNGUENTUM BISMUTHI, L. *Prep.* 1. Nitrate of bismuth ('white bismuth'), 1 dr.; simple ointment, 1 oz.

2. (Fuller.) Nitrate of bismuth, 1 dr.; spermaceti ointment, 19 drs. In itch, and some chronic cutaneous diseases.

Ointment, Blist'ring. See OINTMENT OF CANTHARIDES, and VESICANTS.

Ointment, Blue. This is the vulgar name in England of mercurial ointment. On the Continent, an ointment made of smalts and Goulard water is commonly so called.

Ointment of Bor'ax. *Syn.* UNGUENTUM BORACIS, L. *Prep.* From borax (in very fine powder), 1 dr.; simple ointment or lard, 7 drs. In excoriations, chaps, &c.

Ointment of Bro'mide of Potas'sium. *Syn.* UNGUENTUM POTASSII BROMIDI, U. POTASSÆ HYDROBROMATIS, L. *Prep.* (Magendie.) Bro'mide of potassium, ½ dr.; lard, 1 oz. Resolvent; in bronchocele, scrofula, &c.

Ointment of Bro'mine. *Syn.* UNGUENTUM

BROMINII, U. B. COMPOSITUM, L. *Prep.* (Magendie.) Bromide of potassium, 20 grs.; bromine, 6 to 12 drops; lard, 1 oz. As the last, but more active.

Ointment, Brown. *Syn.* FRENCH POOR-MAN'S FRIEND; UNGUENTUM FUSCUM, U. HYDRARGYRI, F., L. *Prep.* (P. Cod.) Nitric oxide of mercury (levigated), ½ dr.; resin ointment, 1 oz. In ophthalmia (cautiously), after the inflammatory stage is over; as an application to sore legs, &c.

Ointment of Cad'mium. *Syn.* UNGUENTUM CADMI, U. C. SULPHATIS, L. *Prep.* (Radius.) Sulphate of cadmium, 1 to 2 grs.; pure lard, 1 dr.; carefully triturated together. In specks on the cornea.

Ointment of Calamine. *Syn.* UNGUENTUM CALAMINÆ, U. LAPIS CALAMINARIS, U. ZINCI CARBONATIS IMPURI, L. *Prep.* (Ph. D. 1826.) Prepared calamine, 1 lb.; ointment of yellow wax, 5 lbs. Desiccative and healing. This is the old Dublin form for Turner's cerate.

Ointment of Calomel. *Syn.* UNGUENTUM HYDRARGYRI SUBCHLORIDI (B. P.), UNGUENTUM CALOMELANOS, U. HYDRARGYRI CHLORIDI, L. *Prep.* 1. From calomel, 1 dr.; lard, or simple ointment, 1 oz.

Obs. "Were I required to name a local agent pre-eminently useful in skin diseases generally, I should fix on this. It is well deserving a place in the Pharmacopœia." (Pereira.) Dr. Underwood uses elder-flower ointment as the vehicle.

2. (Compound; UNGUENTUM CALOMELANOS COMPOSITUM—Dr. A. T. Thomson.) Calomel, 1 dr.; tar ointment, 4 drs.; spermaceti ointment, 1 oz.

3. (B. P.). Calomel, 1; prepared lard, 5½; mix. In lepra.

Ointment of Camphor. *Syn.* UNGUENTUM CAMPHORÆ, L. *Prep.* 1. Camphor, 1 to 2 drs.; lard, 1 oz.; dissolve by a gentle heat and stir until the mass is nearly cold. Stimulant and anodyne; in prurigo, psoriasis, &c.

2. (Compound.) From powdered opium, ½ dr.; powdered camphor, 1½ dr.; lard, 1½ oz.; mix by trituration. As an anodyne friction in rheumatic pains, swelled joints, colic, &c.

Ointment of Cantharides. *Syn.* UNGUENTUM CANTHARIDIS (B. P., Ph. L. D. & U. S.), U. LYTÆ, L. *Prep.* 1. (Ph. L.) Cantharides (in very fine powder), 3 oz.; distilled water, 12 fl. oz.; mix, boil to one half, to the strained liquid add of resin cerate, 1 lb., and evaporate to a proper consistence.

2. (Ph. D.) Liniment of Spanish flies, 8 fl. oz.; white wax, 3 oz.; spermaceti, 1 oz.; melt together with a gentle heat, and stir until it concretes.

3. (Ph. E.)—*a.* UNGUENTUM INFUSI CANTHARIDIS—Ph. E.) Powdered cantharides, 1 oz.; boiling water, ½ pint; infuse one night (12 hours), strain with expression, add of lard, 2 oz., and boil until the water is expelled; then add bees' wax and resin, of each, 1 oz.,

and when these are liquefied, remove the vessel from the fire, and further add of Venice turpentine, 2 oz.

6. (UNGUENTUM PULVERIS CANTHARIDIS—Ph. E.) Resin ointment, 7 oz.; melt, add of cantharides (in fine powder), 1 oz., and stir until the whole is nearly cold.

4. (B. P.) Cantharides, in fine powder, 1; olive oil, 6; yellow wax, 1: digest the cantharides in the oil for twelve hours, and for $\frac{1}{4}$ hour at 212° ; strain, add the melted wax, and stir till cold.

Obs. The above preparations are frequently called 'blister ointment' or 'épispastic ointment.' They are used to keep blisters open after they have been produced by stronger compounds. The first three compounds are regarded as milder than the last (3, 6), which contains the flies in substance. The P. Cod. contains an ointment (UNG. EPISPASTICUM FLAVUM) which is weaker than the above, prepared by digesting the bruised flies in lard, for 3 hours, over a warm bath; about $\frac{1}{4}$ th part of wax is next added to the strained fat, which is then coloured with turmeric, and scented with oil of lemon. See CERATE, POMMADE, VESICANTS, and *below*.

Ointment of Cantharidine. *Syn.* UNGUENTUM CANTHARIDINE, L. *Prep.* (Soubeiran.) Cantharidine, 1 gr.; white wax, 1 dr.; lard, 7 drs.; mix thoroughly. (See *above*.)

Ointment of Capsicum. *Syn.* UNGUENTUM CAPSICI, L. *Prep.* (Dr. Turnbull.) Tincture of capsicum (pure), q. s.; gently evaporate it until it begins to gelatinize, then mix the extract with twice its weight of lard. As a powerful stimulant and rubefacient. When very freely used, it vesicates.

Ointment of Car'bonate of Am'monia. See AMMONIACAL OINTMENT.

Ointment of Car'bonate of Lead. *Syn.* WHITE LEAD OINTMENT; UNGUENTUM PLUMBI CARBONATIS (P. B., Ph. E. & D.), U. CEBUSSÆ, L. *Prep.* 1. (Ph. E.) Carbonate of lead, 1 oz.; simple ointment, 5 oz.; mix thoroughly.

2. (Ph. D.) Carbonate of lead, 3 oz.; ointment of white wax, 1 lb.; mix with heat.

3. (B. P.) Carbonate of lead, in fine powder, 1; simple ointment, 7: mix.

Uses, &c. Cooling; desiccative. Useful to promote the healing of excoriated parts and slight ulcerations. The camphorated white ointment of old pharmacy (UNG. ALBUM CAMPHORATUM—Ph. L. 1744) was made by adding 40 grs. of camphor to the first of the above.

Ointment of Cat'echu. *Syn.* UNGUENTUM CATECHU, L. *Prep.* From alum, 1 oz.; catechu, 3 oz.; (both in very fine powder;) added to olive oil, $\frac{1}{2}$ pint, and yellow resin, 4 oz., previously melted together. Used to dress ulcers in hot climates, where the ordinary fat ointments are objectionable; also in this country during hot weather. See ASTRINGENT OINTMENT.

Ointment of Char'coal. *Syn.* UNGUENTUM

CARBONIS, L. *Prep.* 1. Resin ointment, 10 drs.; recently burnt charcoal (levigated), 3 drs. As a dressing to foul ulcers, especially those of the legs.

2. (Caspar.) Lime-tree charcoal and dried carbonate of soda, of each, 2 drs.; rose ointment, 1 oz., or q. s. In scald-head.

3. (Radius.) Animal charcoal (recent), 1 part; mallo' ointment, 2 parts. As a friction in glandular enlargements and indurations, as a dressing to fetid ulcers, &c.

Ointment of Cher'ry-Laurel. *Syn.* UNGUENTUM LAURO-CERASI, L. *Prep.* (Soubeiran.) Essential oil of cherry-laurel, 1 dr.; lard, 1 oz. To alleviate the pain in cancer, neuralgia, and other local affections.

Ointment, Chil'blain. *Syn.* UNGUENTUM AD PERNIONES, L. *Prep.* 1. From made mustard (very thick), 2 parts; almond oil and glycerine, of each, 1 part; triturated together. To be applied night and morning.

2. (Cottureau.) Acetate of lead, camphor, and cherry-laurel water, of each, 1 dr.; tar, $1\frac{1}{2}$ dr.; lard, 1 oz.

3. (Devergie.) Creasote and Goulard's extract, of each, 12 drops; extract of opium, $1\frac{1}{2}$ gr.; lard, 1 oz. Twice or thrice daily.

4. (Giacomini.) Sugar of lead, 2 drs.; cherry-laurel water (distilled), 2 fl. dr.; lard, 1 oz.

5. (Linnaeus.) Balsam of Peru, 1 dr.; hydrochloric acid, 2 drs.; spermaceti ointment, $2\frac{1}{2}$ oz.

Obs. For Swediaur's, Vance's, and Wahler's ointments, see article CHILBLAIN.

Ointment of Chlo'ride of Cal'cium. *Syn.* UNGUENTUM CALCI CHLORIDI, U. CALCIS MURIATIS, L. *Prep.* (Sundelin.) Chloride of calcium (dry), 1 dr.; strong vinegar, 40 grs.; foxglove (recent, in fine powder), 2 drs.; lard, 1 oz. In bronchocele, scrofulous tumours, &c.

Ointment of Chloride of Lead. *Syn.* UNGUENTUM PLUMBI CHLORIDI, L. *Prep.* (Tuson.) Chloride of lead, 1 part; simple cerate, 8 parts; carefully triturated together. In painful cancerous ulcerations and neuralgic tumours. See LEAD (Chloride).

Ointment of Chloride of Lime. See OINTMENT OF HYPOCHLORITE OF LIME.

Ointment of Chloride of Mercury. See OINTMENTS OF CALOMEL and CORROSIVE SUBLIMATE.

Ointment of Chlo'rine. *Syn.* UNGUENTUM CHLORINII, L. *Prep.* (Augustin.) Chlorine water, 1 part; lard, 8 parts; well triturated together. In itch, lepra, ring-worm, fetid ulcers, &c.

Ointment of Chlor-i'odide of Mercury. *Syn.* UNGUENTUM HYDRARGYRI CHLORIODIDI, L. *Prep.* (M. Recamier.) Chloriodide (iodochloride) of mercury, 3 grs.; lard, 5 drs. Recommended as a powerful discutient or resolvent. See OINTMENT OF IODO-CHLORIDE OF MERCURY.

Ointment of Chlo'roform. *Syn.* UNGUENTUM CHLOROFORMI, L. *Prep.* (M. Louis.) Chloro-

form, 1 dr.; simple ointment, 1 oz. In neuralgia and rheumatic pains, &c. It must be kept in a stoppered, wide-mouthed phial.

Ointment of Cinchona. *Syn.* OINTMENT OF BARK; UNGUENTUM CINCHONÆ, L. *Prep.* (Bielt.) Red cinchona bark (in very fine powder) and almond oil, of each, 1 part; beef marrow (prepared), 3 parts. In the variety of scald-head termed porrigo decalvans. A little oil of mace or tar is a useful addition.

Ointment, Citrine. See OINTMENT OF NITRATE OF MERCURY.

Ointment of Cocculus Indicus. *Syn.* UNGUENTUM COCCULI (Ph. E.), L. *Prep.* (Ph. E.) Kernels of *Cocculus Indicus*, 1 part; beat them to a smooth paste in a mortar, first alone, and next with a little lard; then further add of lard, q. s., so that it may be equal to 5 times the weight of the kernels. *Used* to destroy pediculi, and in scald-head, &c.

Ointment of Cod-liver Oil. *Syn.* UNGUENTUM OLEI MORRHUÆ, U. o. JECORIS ASELLI, L. *Prep.* Cod-liver oil (pale and recent), 7 parts; white wax and spermaceti, of each, 1 part; melted together. In ophthalmia and opacity of the cornea, either alone or combined with a little citrine ointment; as a friction or dressing for scrofulous indurations and sores; in rheumatism, stiff joints, and in several skin diseases. It often succeeds in porrigo or scald-head when all other remedies have failed. Scented with oil of nutmeg and balsam of Peru, it forms an excellent pomade for strengthening and restoring the hair.

Ointment of Colocyth. *Syn.* UNGUENTUM COLOCYNTHIDIS, L. *Prep.* (Chrestien.) Colocyth pulp (in very fine powder), 1 part; lard, 8 parts. *Used* in frictions on the abdomen as a hydragogue purgative, in mania, dropsy, &c.

Ointment of Corrosive Sublimate. *Syn.* OINTMENT OF CHLORIDE OF MERCURY; UNGUENTUM HYDRARGYRI CHLORIDI, L. *Prep.* 1. From corrosive sublimate, 2 to 5 grs.; rub it to powder in a glass or wedgwood-ware mortar; add of rectified spirit, 6 or 7 drops, or q. s.; again triturate; lastly add, gradually, of spermaceti ointment (reduced to a cream-like state by heat), 1 oz., and continue the trituration until the whole concretes. *Used* as a stimulant, detergent, and discutient application in various local affections; in lepra; porrigo, acne, &c., and as a dressing to syphilitic and some other ulcers.

2. (Ph. Chirur.) Corrosive sublimate, 10 grs.; yolk of 1 egg; lard, 1 oz. As a dressing.

3. (POMMADE DE CIRILLO—P. Cod.) Corrosive sublimate, 1 dr.; lard, 1 oz. Caustic; must not be confounded with the preceding.

Ointment, Cosmetic. *Syn.* UNGUENTUM COSMETICUM, L.; POMMADE DE LA JEUNESSE, Fr. *Prep.* (Quincey.) Spermaceti, 3 dr. (better, 4½ dr.); oil of almonds, 2 oz.; melt together, and, when cooled a little, stir in of nitrate of bismuth ('white bismuth'), 1 dr.; and, lastly,

of oil of rhodium, 6 drops. In itch and some other cutaneous eruptions; but chiefly as a pomade for the hair. Its frequent use is said to turn the latter black.

Ointment of Creasote. *Syn.* UNGUENTUM CREASOTI (B. P., Ph. L. E. D. & U. S.), L. *Prep.* 1. (Ph. L.) Creasote, ½ fl. dr.; lard, 1 oz.; triturate together.

2. (Ph. E.) Lard, 3 oz.; melt it by a gentle heat; add of creasote, 1 dr., and stir the mixture until it is nearly cold.

3. (Ph. D.) Creasote, 1 fl. dr.; ointment of white wax, 7 drs.; as the last.

4. (B. P.) Creasote, 1; simple ointment, 8; mix.

Uses, &c. In several skin diseases, especially ring-worm; as a friction in tic-douloureux; a dressing for scalds and burns; an application to chilblains, &c., &c.

Ointment of Croton Oil. *Syn.* UNGUENTUM CROTONIS, L. *Prep.* 1. Croton oil, 15 to 30 drops; lard (softened by heat), 1 oz.; mix well. This is the usual and most useful strength to prepare the ointment. Rubefacient and counter-irritant; in rheumatism and various other diseases. When rubbed repeatedly on the skin, it produces redness and a pustular eruption. It also often affects the bowels by absorption. The only advantage it possesses over other preparations of the class is the rapidity of its action.

2. (RUBEFACIENT POMMADE—Caventou.) White wax, 1 part; lard, 5 parts; melt together, and, when quite cold, mince it small, add of croton oil, 2 parts, and mix by trituration. Stronger than the last.

Ointment of Cy'anide of Mer'cury. *Syn.* UNGUENTUM HYDRARGYRI CYANIDI, L. *Prep.* 1. (Cazenave.) Cyanide of mercury, 8 grs.; lard, 1 oz.; carefully triturated together.

2. (Pereira.) Cyanide of mercury, 10 to 12 grs.; lard, 1 oz. As a dressing for scrofulous and syphilitic ulcers, &c.; as an application in psoriasis, moist tetters, and some other skin diseases, &c. Bielt orders the addition of a few drops of essence of lemon.

Ointment of Cyanide of Potas'sium. *Syn.* UNGUENTUM POTASSII CYANIDI, L. *Prep.* (Cazenave.) Cyanide of potassium, 12 grs.; oil of almonds, 2 drs.; triturate, add of cold cream (dry), 2 oz., and mix by careful trituration. As an anodyne in neuralgia, rheumatism, swelled joints, &c.; also as a friction over the spine in hysteria, and over the epigastrium in gastrodynia, &c.

Ointment of Delphin'ine. *Syn.* UNGUENTUM DELPHINIE, L. *Prep.* (Dr. Turnbull.) Delphinine or delphinia, 10 to 30 grs.; olive oil, 1 dr.; lard, 1 oz.; mix as the last. *Used* as a friction in rheumatism, and the other cases in which veratrine is employed.

Ointment, Depilatory. *Syn.* UNGUENTUM DEPILIATORIUM, L. See DEPIILATORY (Cazenave's).

Ointment, Desiccative. *Syn.* DRYING OINTMENT; UNGUENTUM DESICCATIVUM, U. EX-

SICCANS, L. See the OINTMENTS OF CALAMINE, LEAD, ZINC, &c.

Ointment, Detergent. *Syn.* UNGUENTUM DETERGENS, L. The OINTMENTS OF NITRATE OF MERCURY, NITRIC OXIDE OF MERCURY, TAR, VERDIGRIS, &c., when not too strong, come under this head.

Ointment, Digestive. *Syn.* UNGUENTUM DIGESTIVUM, L. *Prep.* 1. (P. Cod.) Venice turpentine, 2 oz.; yolks of 2 eggs; mix, and add of oil of St. John's wort, $\frac{1}{2}$ oz.

2. (DIGESTIF ANIMÉ—P. Cod.) As the last, with an equal weight of liquid styrax.

3. (DIGESTIF MERCURIEL—P. Cod.) As No. 1, with an equal weight of mercurial ointment.

4. (UNG. D. VIRIDE—Dr. Kirkland.) Bees' wax, gum elemi, and yellow resin, of each, 1 oz.; green oil, 6 oz.; melt them together, and, when considerably cooled, add of oil of turpentine, 2 drs.

Ointment, Edinburgh. Two compounds are known under this name:—1. (BROWN.) From black basilicon, 6 parts; milk of sulphur, 2 parts; sal ammoniac, 1 part.

2. (WHITE.) From white hellebore, 3 oz.; sal ammoniac, 2 oz.; lard, 1 lb. Both are used in itch.

Ointment of Eggs. *Syn.* UNGUENTUM OVORUM, L. *Prep.* 1. Yolk of 1 egg; honey and fresh linseed oil, of each, 1 oz.; balsam of Peru, $\frac{1}{2}$ dr.; mix well.

2. (Soubeiran.) Bees' wax, 4 drs.; oil of almonds, $1\frac{1}{2}$ oz.; yolk of 1 egg. As an emollient and soothing dressing to excoriations, irritable ulcers, &c.

Ointment, Egyptian. *Prep.* (Giordano.) Burnt alum, 1 part; verdigris, 10 parts; strong vinegar, 14 parts; purified honey (thick), 32 parts; mix by heat and agitation. As a detergent application to foul ulcers. It is a modification of the 'UNGUENTUM ÆGYPTIACUM' of old pharmacy.

Ointment of Elder flowers. *Syn.* WHITE ELDER-OINTMENT; UNGUENTUM SAMBUCI FLO- RUM, U. SAMBUCI (Ph. L.), L. *Prep.* 1. (Ph. L.) Elder flowers and lard, of each, 1 lb.; boil them together until the flowers become crisp, then strain, with pressure, through a linen cloth. The same precautions must be observed as are necessary in the preparation of the medicated oils, by infusion. Emollient; less white and odorless than the following:—

2. (Wholesale.) Take of lard (hard, white, and sweet), 25 lbs.; prepared mutton suet, 5 lbs.; melt them in a well-tinned copper or earthen vessel, add of elder-flower water, 3 galls., agitate briskly for about $\frac{1}{2}$ an hour, and set it aside; the next day gently pour off the water, re-melt the ointment, and add of benzoic acid, 5 drs.; otto of roses, 20 drops; oil of bergamot and oil of rosemary, of each, 1 dr.; again agitate well, let it settle for 10 minutes, and then pour off the clear portion into pots for sale. Very agreeable, and keeps well.

Obs. The last formula is the one now

generally adopted by the large wholesale houses.

Ointment of Elder leaf. *Syn.* ELDER OINTMENT, GREEN E. O.; UNGUENTUM VIRIDE, U. SAMBUCI VIRIDE, U. SAMBUCI (Ph. D. 1826), L. *Prep.* 1. (Ph. D. 1826.) Fresh elder leaves (bruised), 3lbs.; suet, 4 lbs.; lard, 2 lbs.; boil together, as above.

2. (Wholesale.) Good fresh lard, 1 cwt., fresh elder leaves, 56 lbs.; boil till crisp, strain off the oil, put it over a slow fire, add hard prepared mutton-suet, 14 lbs., and gently stir it until it acquires a bright green colour.

Obs. The above ointment is reputed to be emollient and cooling, and has always been a great favourite with the common people. Both elder-flower and elder-leaf ointment are, however, unnecessary preparations. "They are vestiges of the redundant practice of former times." (A. T. Thomson.) The above formulæ are those now almost exclusively employed in trade. The ointment should be allowed to cool very slowly, and after its temperature has fallen a little, and it begins to thicken, it should not be stirred, in order that it may 'grain' well, as a granular appearance is much admired. It is a common practice to add powdered verdigris to deepen the colour, but then the ointment does not keep well. This dangerous fraud may be detected in the manner noticed under SAVINE CERATE (page 314).

Ointment of Elemi. *Syn.* BALSAM OF AR- CÆUS†, UNGUENTUM ELEMI (B. P., Ph. L. & D.), L. *Prep.* 1. (Ph. L.) Elemi, 3 oz.; suet, 6 oz.; melt them together, remove the vessel from the fire, and stir in of common turpentine, $2\frac{1}{2}$ oz.; olive oil, $\frac{1}{2}$ fl. oz.; lastly, strain the whole through a linen cloth.

2. (Ph. D.) Resin of elemi, 4 oz.; ointment of white wax, 1 lb.; melt them together, strain through flannel, and stir the mixture constantly until it concretes.

3. (B. P.) Elemi, 1; simple ointment, 4; melt and strain.

Uses, &c. Stimulant and digestive. It is frequently employed to keep open issues and setons, and as a dressing for old and ill-conditioned sores. The 'UNG. ELEMI CUM ERU- GINE' of St. George's Hospital is made by adding 1 dr. of finely powdered verdigris to every 6 oz. of the ointment.

Ointment, Escharotic. *Syn.* UNGUENTUM ESCHAROTICUM, L. *Prep.* 1. (Sir B. Brodie.) Corrosive sublimate, 1 dr.; nitric oxide of mercury, sulphate of copper, and verdigris, of each, 2 drs. (all in very fine powder); lard, q. s. See ARSENICAL OINTMENT and CERATE.

Ointment, Eye. *Syn.* EYE SALVE; UNGU- ENTUM OPHTHALMICUM, L. *Prep.* 1. (Dr. Col- lier.) Burnt alum, $\frac{1}{2}$ dr.; powdered opium, 20 grs.; olive oil, 1 fl. dr.; spermaceti ointment, 2 drs. In inflammation of the eyelids, purulent ophthalmia, &c.

2. (W. Cooley.) Chloride of barium, 6 grs.; calomel, 10 grs.; simple ointment, 1 oz.; otto

of roses, 1 or 2 drops. In scrofulous ophthalmia.

3. (Dessault.) Nitric oxide of mercury, carbonate of zinc, acetate of lead, and dried alum, of each, 1 dr.; corrosive sublimate, 10 grs.; rose ointment, 1 oz. In chronic ophthalmia, profuse discharges, &c.; in general, diluted.

4. (Dupuytren.) Red oxide of mercury, 10 grs.; sulphate of zinc, 20 grs.; lard, 2 oz. For chronic inflammation of the eyelids, chronic ulcers, &c.

5. (Fricke.) Nitrate of silver, 10 grs.; zinc ointment, 2 drs.; balsam of Peru, $\frac{1}{2}$ dr. In ulceration of the cornea, and in acute, purulent, and chronic ophthalmia, &c., employing great caution in its use.

6. (Guthrie.) Spermaceti ointment, 1 dr.; solution of diacetate of lead, 15 drops; nitrate of silver, 2 to 10 grs. As the last, and in cases wherein a direct caustic action is desired. The stronger ointment often occasions intense pain.

7. (Hufeland.) Black oxide of mercury, 2 grs.; spermaceti cerate and walnut oil, of each, 1 dr. In chronic affections of the eyes or eyelids, particularly in those of a syphilitic character.

8. (Janin.) Ammonio-chloride of mercury, 1 dr.; tutty and bole, of each, 2 drs.; lard, 1 oz. In debility of the conjunctiva, in chronic inflammation with excessive secretion, &c.

9. (Marshall.) See CERATE (Marshall's).

10. (Parker.) Iodine, 1 gr.; iodide of potassium, 5 grs.; simple ointment, 3 drs. In scrofulous ophthalmia, thickening of the conjunctiva, opacity of the cornea, &c.

11. (Pellier.) Nitric oxide of mercury and carbonate of zinc, of each, $1\frac{1}{2}$ dr.; tutty, $\frac{1}{2}$ dr.; red sulphuret of mercury, 20 grs.; lard, 2 oz.; balsam of Peru, 15 drops. In specks in the eye arising from small ulcers which have healed up; in excessive defluxions, &c.

12. (Ratier.) Liqueur of diacetate of lead, $\frac{1}{2}$ dr.; wine of opium, 1 dr.; lard, 5 drs. In excoriations, and the variety of chronic ophthalmia popularly termed 'blear eye.'

13. (Regent.) Acetate of lead and red precipitate, of each, 1 dr.; camphor, 6 grs.; washed fresh butter, $2\frac{1}{2}$ oz. As the last, and in chronic ulcerations.

14. (Singleton's GOLDEN OINTMENT.) According to Dr. Paris, this compound consists of lard medicated with orpiment (native yellow sulphuret of arsenic). There appears, however, to be some mistake in this, as that sold us under the name had nearly the same composition as the OINTMENT OF NITRIC OXIDE OF MERCURY of the Pharmacopœia. It did not contain even a trace of either arsenic or sulphur. The action of this nostrum, and the reputation which it has acquired, fully justify this conclusion.

15. (Smellome.) From verdigris (levigated), $\frac{1}{2}$ dr.; olive oil, 1 fl. dr.; triturate together, add of yellow basilicon, 1 oz., and again tri-

turate until it begins to concrete. A popular nostrum, sometimes useful in chronic inflammation and ulcerations of the eyelids, &c., especially in those of a scrofulous character.

16. (Spielmann.) Acetate of lead, 20 grs.; spermaceti cerate, 5 drs.; compound tincture of benzoin, 40 grs. Cooling; dessicative. In inflamed eyelids, excoriations, &c.

17. (St. Yve.) Fresh butter (washed), 1 oz.; white wax, 1 dr.; camphor, 15 grs.; melt by a gentle heat, and, when cooled a little, add of red precipitate (levigated), $\frac{1}{2}$ dr.; oxide of zinc, 20 grs. In chronic inflammation of the coats of the eye, or of the eyelids, specks on the cornea, &c.

18. (Thomson.) Levigated oxide of zinc, 1 dr.; lard, 9 drs.; wine of opium, 20 drops. In chronic ophthalmia depending on want of tone in the vessels and integuments of the eye.

19. (Velpeau.) Precipitated sesquioxide of iron (recent, but dry), $\frac{1}{2}$ dr.; lard, 5 drs.; oil of almonds, 1 fl. dr.; balsam of Peru, 15 drops. As the last, especially in 'blear eye.'

20. (Ware.) Wine of opium, 1 fl. dr.; simple ointment, 3 drs. In ophthalmia, after the inflammatory symptoms have subsided, and the vessels remain red and turgid.

Obs. The ingredients entering into the composition of all the above ointments must be reduced to the state of impalpable powder before mixing them; and the incorporation should be made by long trituration in a wedge-wood-ware mortar, or, preferably, for those that contain substances that are very gritty, by levigation on a porphyry slab, with a muller. The most serious consequences, even blindness, have resulted from the neglect of these precautions. They should all be employed in exceedingly small quantities at a time, and they should be very carefully applied by means of a camel-hair pencil or a feather; and, in general, not until acute inflammation has subsided. The stronger ones, in most cases, require dilution with an equal weight to twice their weight of lard or simple ointment, and should only be used of their full strength under proper medical advice. Various other formulæ for OPHTHALMIC OINTMENTS will be found under the names of their leading ingredients.

Ointment of Fig'wort. See OINTMENT OF SCROPHULARIA.

Ointment of Foxglove. *Syn.* UNGUENTUM DIGITALIS, L. *Prep.* 1. From fresh foxglove, as ointment of hemlock—Ph. L. As an application to chronic ulcers, glandular swellings, &c.

2. (Rademacher.) Extract of foxglove, 2 drs.; lard, 1 oz. In croup; spread on lint, and applied as a plaster to the throat.

Ointment of Fu'ligoka'li. See FULIGOKALL.

Ointment of Galls. *Syn.* UNGUENTUM GALLÆ (B. P., Ph. D.), L. *Prep.* 1. (Ph. D.), Gall-nuts (in very fine powder), 1 dr.; ointment of white wax, 7 drs.; rub them together until a uniform mixture is obtained.

2. (B. P.) Galls, in very fine powder, 80 grs.; benzoated lard, 1 oz.; mix. An excellent application to piles, either alone or mixed with an equal quantity of zinc ointment; also highly useful in ring-worm of the scalp.

Ointment of Galls and Opium. *UNGUENTUM GALLÆ CUM OPIO* (B. P.); *UNGUENTUM GALLÆ OPIATUM*, *U. GALLÆ COMPOSITUM*—Ph. L., *U. GALLÆ ET OPII*,—(Ph. E.)—*Prep.*

1. (Ph. L.) Gall-nuts (very finely powdered), 6 drs.; powdered opium, $1\frac{1}{2}$ dr.; lard, 6 oz.; rub them together.

2. (Ph. E.) Galls, 2 drs.; opium, 1 dr.; lard, 1 oz.; as the last.

3. (B. P.) Ointment of galls, 1 oz.; opium (in powder), 32 grs.; mix.

Uses, &c. A most valuable astringent and anodyne in blind piles, slight cases of prolapsus ani, &c. Some practitioners add 1 dr. of camphor. The ointment of the Ph. E. is much the strongest.

OINTMENT OF GALLS WITH MORPHIA. *UNGUENTUM GALLÆ ET MORPHIÆ*—Dr. Paris.) Morphia, 2 grs.; olive oil (hot), 2 fl. drs.; triturate, add of zinc ointment (Ph. L.), 1 oz.; powdered galls, 1 dr.; and mix thoroughly. In piles. The quantity of galls should be doubled.

Ointment of Garlic. *Syn. UNGUENTUM ALLII*, L. *Prep.* 1. Fresh garlic (bruised), 2 parts; lard, 3 parts; simmer together for $\frac{1}{2}$ an hour, and then strain with expression. Rubbed on the abdomen in chronic diarrhœa and colic, and over the chest and spine in whooping-cough.

2. (Beasley.) Fresh garlic and lard, equal parts; beaten together. Applied to the feet in whooping-cough.

Ointment, Giacomini's. See CHILBLAIN OINTMENT.

Ointment of Gold. *Syn. UNGUENTUM AURI*, L.; *POMMADE D'OR*, Fr. *Prep.* 1. (Legrand.) Gold (in powder), 12 grs.; lard, 1 oz. As a dressing for syphilitic ulcers, and as a friction in glandular indurations, &c.; also endermically.

2. (Magendie.) Amalgam of gold, 1 dr.; lard, 1 oz. For endermic use, chiefly. When the surface becomes dry, the ointment of terchloride of gold is to be substituted as a dressing. In rheumatic pains, neuralgia, &c.

Ointment, Gold'en. See EYE OINTMENT, CHRENE O., &c.

Ointment, Gondret's. See AMMONIACAL OINTMENT.

Ointment, Goulard's. *Syn. UNGUENTUM GOULARDI*, *U. LITHARGYRI ACETATIS*, L. *Prep.* (Ph. Chirur.) Goulard's extract, 1 dr.; simple ointment, 2 oz. See CERATE (Lead).

Ointment Green. See ELDER OINTMENT.

Ointment of Hellebore. *Syn. OINTMENT OF WHITE HELLEBORE*; *UNGUENTUM VERATRI*, L. *Prep.* 1. (Ph. L. 1836.) White hellebore (in very fine powder), 2 oz.; lard, 8 oz.; oil of lemons, 20 drops. In itch, lepra, ring-worm, &c.; and to destroy insects in the hair of

children. It should be used with caution, and, preferably, diluted with an equal weight of lard.

2. (Compound; *UNGUENTUM VERATRI COMPOSITUM*.)—*a.* (Rayer.) White hellebore, 1 oz.; sal ammoniac, $\frac{1}{2}$ oz.; lard, 8 oz. *Used* as the last.

b. See SULPHUR OINTMENT (Compound)—Ph. L.

Ointment of Hemlock. *Syn. UNGUENTUM CONII* (Ph. L.), L. *Prep.* 1. (Ph. L.) Fresh hemlock leaves and lard, of each, 1 lb.; boil them together (very gently) until the leaves become crisp, then strain through linen, with pressure. See OILS (Medicated.)

2. Extract of hemlock, 1 dr.; lard, 9 drs.; triturate together.

Uses, &c. As a local anodyne in neuralgic and rheumatic pains, glandular enlargements, painful piles, &c.; and as a dressing to painful and irritable ulcers, cancerous sores, &c.

Ointment of Henbane. *Syn. UNGUENTUM HYOSCYAMI*, L. *Prep.* 1. Fresh henbane leaves, 1 lb.; lard, 2 lbs.; boil until nearly crisp.

2. (Taddei.) Extract of henbane, 1 dr.; lard, 1 oz. Anodyne; in painful piles, sores, &c., as the last.

Ointment, Holloway's. See PATENT MEDICINES.

Ointment of Hops. *Syn. UNGUENTUM LUPULI*, L. *Prep.* (Swediaur.) Hops (commercial), 2 oz.; lard, 10 oz.; as extract of hemlock, Ph. L. In painful piles and cancerous sores.

Ointment of Hydriodate of Ammonia. *Syn. UNGUENTUM AMMONIÆ HYDRIODATIS*, L. *Prep.* From hydriodate of ammonia (iodide of ammonium), $\frac{1}{2}$ dr.; simple ointment, 1 oz. *Used* chiefly as an application to scrofulous tumour and ulcers, in irritable subjects.

Ointment of Hydrochloric Acid. *Syn. UNGUENTUM ACIDI HYDROCHLORICI*, L. *Prep.* (Dr. Corrigan.) Hydrochloric acid, 1 dr.; simple ointment, 1 oz. As a dressing for scald-head, after the scabs have been removed by emollient liniments or poultices.

Ointment of Hypochlorite of Lime. *Syn. OINTMENT OF CHLORIDE OF LIME*; *UNGUENTUM CALCIS HYPOCHLORITIS*, *U. C. CHLORINATE*, L. *Prep.* 1. From chlorinated lime (chloride of lime), 1 dr.; lard, 1 oz.; carefully triturated together. In scrofulous swellings, goitre, chilblains, indolent glandular tumours, &c.

2. Chlorinated lime, 1 dr.; powdered fox-glove, 2 drs.; simple ointment, 2 oz. As an application to fetid and malignant ulcers, &c.

Ointment of Hypochlorite of Sulphur. *Syn. UNGUENTUM SULPHURIS HYPOCHLORITIS*, L. *Prep.* (Dr. Copland.) 'Hypochlorite of sulphur,' 1 dr.; simple ointment, 1 oz. It is generally scented with oil of almonds. *Used* in psoriasis inveterata, and some other skin diseases.

Ointment of Iodide of Arsenic. *Syn. UN-*

GUENTUM ARSENICI IODIDI, L. Prep. (Biett.) Iodide of arsenic, 2 to 3 grs.; lard, 1 oz.; carefully triturated together. In lepra, psoriasis, &c.; and in corroding tubercular diseases. It should be used with caution, and not more than $\frac{1}{2}$ dr. applied at once.

Ointment of Iodide of Ba'rrium. Syn. UNGUENTUM BARI IODIDE, L. Prep. (Magendie.) Iodide of barium, 3 to 4 grs.; lard, 1 oz. As a friction to scrofulous swellings and indurations. The usual proportions are now 5 gr. to the oz.

Ointment of Iodide of Lead. Syn. UNGUENTUM PLUMBI IODIDI (B. P., Ph. L. & D.), L. Prep. 1. (Ph. L.) Iodide of lead, 1 oz.; lard, 8 oz.; rub them together.

2. (Ph. D.) Iodide of lead (in fine powder), 1 dr.; ointment of white wax, 7 drs.

3. (B. P.) Iodide of lead, in fine powder, 62 grs.; simple ointment, 1 oz.; mix. An excellent application to scrofulous tumours and swelled glands, especially when accompanied with pain.

Ointment of Green Iodide of Mer'cury. Prep. 1. (OINTMENT OF SUBIODE OF MERCURY, O. OF PROTIOIDE OF M.*; UNGUENTUM HYDRARGYRI IODIDI—Ph. L.)—*a.* (Ph. L.) White wax, 2 oz.; lard, 6 oz.; melt them together, add of iodide (green iodide) of mercury, 1 oz., and rub them well together.

2. (Magendie.) Green iodide of mercury, 23 grs.; lard, $1\frac{1}{2}$ oz.

Uses, &c. In tubercular skin diseases, as a friction in scrofulous swellings and indolent granular tumours, and as a dressing for ill-conditioned ulcers, especially those of a scrofulous character.

Ointment of Red Iodide of Mercury. UNGUENTUM HYDRARGYRI IODIDI RUBRI, B. P., O. OF BINIOIDE OF M.*; UNGUENTUM HYDRARGYRI BINIOIDI,* U. H. IODIDI RUBRI—Ph. D.)—1. (Ph. D.) Red iodide of mercury, 1 dr.; ointment of white wax, 7 drs.; mix by careful trituration.

2. (Soubeiran.) Red iodide of mercury, 20 grs.; lard, $1\frac{1}{2}$ oz.

3. (B. P.) Red iodide of mercury (in very fine powder), 16 grs.; simple ointment, 1 oz.; mix.

Uses, &c. Similar to those of the preceding, but it is much more stimulant, and is regarded as better adapted for obstinate syphilitic sores. Largely diluted with lard or almond oil, it is applied to the eyes in like cases.

Ointment of Iodide of Potas'sium. Syn. UNGUENTUM POTASSII IODIDI (B. P., Ph. L. & D.). L. Prep. 1. (Ph. L.) Iodide of potassium, 2 drs., dissolved in boiling distilled water, 2 fl. drs.; lard (softened by heat), 2 oz.; triturate together until united.

2. (Ph. D.) Iodide of potassium, 1 dr.; distilled water, $\frac{1}{2}$ fl. dr.; ointment of white wax, 7 drs.; as before.

3. (Magendie.) Iodide of potassium, 1 dr.; lard, 12 drs.

4. (Le Gros.) Iodide, $\frac{1}{2}$ dr.; lard, 1 oz.

5. (B. P.) Iodide of potassium, 64 grs.;

carbonate of potash, 4 grs.; distilled water, 1 dr.; prepared lard, 1 oz.; dissolve the carbonate and the iodide in the water, and mix thoroughly with the lard.

Uses, &c. As a friction in scrofula, bronchocele, glandular enlargements, indurations, &c.; as a dressing to scrofulous ulcers, as an application in scrofulous ophthalmia, and in most of the other applications in which the employment of iodine is indicated. The last formula has been successfully employed by M. Le Gros in itch.

Obs. The strength of this ointment, as prescribed by different parties, varies greatly, the proportions of the iodide ranging from $\frac{1}{2}$ to $\frac{1}{3}$ of the whole, to adapt it to particular cases. When other ingredients are added, the iodide must be used in a perfectly dry state, and in fine powder, instead of being dissolved in water. This is particularly necessary when it is to be mixed with mercurial ointment.

Ointment of Iodide of Sulphur. Syn. UNGUENTUM SULPHURIS IODIDI (B. P., Ph. L., L. Prep. 1. (Ph. L.) Iodide of sulphur (in fine powder, $\frac{1}{2}$ dr.; lard, 1 oz.; mix by trituration.

2. (Cazenave.) Iodide of sulphur, 12 to 15 grs.; lard, 1 oz.

3. (B. P.) Iodide of sulphur, 1; lard, 16; mix.

Uses, &c. As a local stimulant and alterative, in the chronic forms of lepra, lupus, porrigo, psoriasis, itch, &c.; also a remedy for acne punctata. A few drops of oil of cloves or nutmeg are commonly added.

Ointment of Iodide of Zinc. Syn. UNGUENTUM ZINCI IODIDI, L. Prep. 1. From iodide of zinc, 12 grs.; simple ointment, 1 oz. In scrofulous excoriations, and in the chronic ophthalmia of scrofulous subjects, arising from a relaxed state of the tissues and vessels.

2. (Dr. Ure.) Iodide of zinc, 1 dr.; lard, 1 oz. As a friction to glandular tumours and indurations, and as a dressing to flabby and obstinate scrofulous ulcers.

Ointment of Iodine. Syn. UNGUENTUM IODI (B. P.), UNGUENTUM IODINII (Ph. U. S.). Prep. 1.—(B. P.) Iodine, 32 grs.; iodide of potassium, 32 grs.; proof spirit, 1 dr.; rub together and add prepared lard, 2 oz. See OINTMENT OF IODINE (Compound).

2. (Ph. U. S.) Iodine, 20 grs.; rectified spirit, 20 drops; rub them together, then add of lard, 1 oz.

Ointment of Iodine (Compound). Syn. OINTMENT OF IODURETTED IODIDE OF POTASSIUM; UNGUENTUM POTASSII IODIDI IODURETUM, U. IODINII COMPOSITUM—Ph. L. & D., U. IODINII—Ph. E.—*a.* (Ph. L.) Iodine of potassium (in very fine powder), 1 dr.; lard, 2 oz.; mix, then add of iodine, $\frac{1}{2}$ dr., dissolved in rectified spirit, 1 fl. dr., and mix all together. See OINTMENT OF IODINE (B. P.)

b. (Ph. E.) Iodine, 1 dr.; iodide of potassium, 2 drs.; rub them together, then gradually add of lard, 4 oz.

c. (Ph. D.) Pure iodine, $\frac{1}{2}$ dr.; iodide of

potassium, 1 dr.; rub them well together in a glass or porcelain mortar, then gradually add of ointment of white wax, $14\frac{1}{2}$ drs., and continue the trituration until a uniform ointment is obtained.

Uses, &c. The compound ointment is an excellent friction in goitre, and in enlarged or indurated glands or tumours, more especially those of a scrofulous character; in the quantity of $\frac{1}{2}$ to 1 dr., night and morning. It may be advantageously combined with extract of belladonna in the incipient bubo of scrofulous subjects, and in the early stages of cancer; and, with an equal weight of mercurial ointment, as a friction in cases of enlarged liver and spleen, and ovarian dropsy. The simple ointment of the Ph. U. S. is generally regarded as weaker and less efficacious than the compound.

Ointment of Iodo-chloride of Mercury. *Syn.* UNGUENTUM HYDRARGYRI IODO-BICHLORIDI*, L. *Prep.* From iodo-chloride of mercury, 16 grs.; simple ointment, 1 oz. Discutient; probably one of the most powerful known in syphilitic cases complicated with scrofula. *See* OINTMENT OF CHLORIODIDE OF MERCURY.

Ointment of Iodo-hydrargyrate of Potassa. *Syn.* UNGUENTUM POTASSÆ IODO-HYDRARGYRATIS, L. *Prep.* 1. (Lamothé.) Iodo-hydrargyrate of potassa, 20 grs.; lard, 1 oz.

2. (Puche.) Red iodide of mercury and iodide of potassium, of each, 8 grs.; lard, 1 oz. As a powerful stimulant discutient; in tumours, inflammatory sore throat, &c.

Ointment, Iodo-narcotic. *Syn.* UNGUENTUM IODO-NARCOTICUM, L. *Prep.* (Purvis.) Iodine, 20 grs.; iodide of potassium, 2 drs.; oil of tobacco (by infusion), $1\frac{1}{2}$ dr.; lard, 3 drs. To relax rigid muscles.

Ointment of Ipecacuanha. *Syn.* UNGUENTUM IPECACUANHÆ, L. *Prep.* (Dr. Turnbull.) Ipecacuanha (in fine powder), 2 drs.; olive oil, 2 fl. drs.; lard or simple ointment, 4 drs. Counter-irritant; when frequently employed as a friction, it occasions an eruption, but one of a milder character than that from either croton oil or tartar emetic.

Ointment, Is'sue. *Syn.* UNGUENTUM AD-FONTICULOS, L. *Prep.* (Golding Bird.) Ointment of cantharides (Ph. L.), $1\frac{1}{2}$ oz.; tartar emetic (in impalpable powder), 8 grs.; spermaceti ointment, 2 oz. As a stimulating application to issues, to promote the discharge. *See* ELEMI OINTMENT, CERATE, PLASTER, &c.

Ointment, Itch. *Syn.* UNGUENTUM ANTI-PRURICUM, L. Several excellent formulæ for itch ointments will be found under the names of their leading ingredients. The following are additional ones, including some nostrums:—

1. (Bailey.) From alum, nitre, and sulphate of zinc, of each, in very fine powder, $1\frac{1}{2}$ oz.; vermilion, $\frac{1}{2}$ oz.; mix, add gradually of sweet oil, $\frac{1}{2}$ pint; triturate together until perfectly mixed, then further add of lard (softened by

heat), 1 lb., with oils of aniseed, lavender, and origanum, q. s. to perfume.

2. (Bateman.) Carbonate of potassa, $\frac{1}{2}$ oz.; rose water, 1 fl. oz.; red sulphuret of mercury, 1 dr.; oil of bergamot, $\frac{1}{2}$ fl. dr.; sublimed sulphur and hog's lard, of each, 11 oz.; mix them. (Bateman, 'Cutan. Diseases.') The nostrum vended under the name is made as follows:—Carbonate of potash, 1 oz.; vermilion, 3 drs.; sulphur, 1 lb.; lard, $1\frac{1}{2}$ lb.; rose water, 3 fl. oz.; oil of bergamot, $1\frac{1}{2}$ dr.

3. (French Hosp.) Chloride of lime, 1 dr.; rectified spirit, 2 fl. drs.; sweet oil, $\frac{1}{2}$ fl. oz.; common salt and sulphur, of each, 1 oz.; soft soap, 2 oz.; oil of lemon, 20 drops. Cheap, effectual, and inoffensive.

4. (De La Harpe.) Sulphur, 2 oz.; powdered white hellebore, $\frac{1}{2}$ oz.; sulphate of zinc, $\frac{1}{2}$ do.; soft soap, 4 oz.; lard, 8 oz.

5. (Jackson.) From palm oil, flowers of sulphur, and white hellebore, of each, 1 part; lard, 2 parts.

6. (Nugent.) From white lead, 2 oz.; orris root, 1 oz.; corrosive sublimate, in very fine powder, $\frac{1}{2}$ oz.; palm oil, 4 oz.; lard, $1\frac{1}{2}$ lb.

7. (Ph. E. 1744.) Elecampare root and sharp-pointed dock (*Rumex acutus*—Linn.), of each, bruised, 3 oz.; water, 1 quart; vinegar, $\frac{1}{2}$ pint; boil to one half, add of water-cress, 10 oz.; lard, 4 lbs.; boil to dryness, and strain with expression; to the strained liquid add of bees' wax and oil of bays, of each, 4 oz.; and stir the mixture until nearly cold.

8. (UNG. A. COMP.—Ph. E. 1744.) To each lb. of the last, add of strong mercurial ointment, 2 oz.

9. (Robertson.) Soft soap, 1 oz.; rum, 1 table-spoonful; chloride of lime (dry and good), $\frac{1}{2}$ oz.; mix, and add of lard, 2 oz.

10. (Swediaur.) Stavesacre (in powder), 1 oz.; lard, 3 oz.; digest with heat for 3 hours, and then strain. The formula of the Ph. Bruns. is nearly similar. Very useful in itch; also to destroy pediculi.

11. (Thomson.) Chloride of lime and common salt, of each, in fine powder, 1 dr.; soft soap, 1 oz.; rectified spirit, 2 fl. drs.; mix, add of lard, 1 oz.; and, lastly, of strong vinegar, 3 fl. drs. Very cleanly and effective; but should not be made in quantity, as it does not keep well.

12. (Voght.) Chloride of lime (dry), 2 drs.; burnt alum, 3 drs.; lard, 9 drs. To be mixed with an equal quantity of soft soap at the time of fusing it.

Obs. The products of the preceding formulæ are used by well rubbing them into the part affected, night and morning, as long as necessary, the number of applications required depending greatly on the manner in which this is done.

Ointment of Ivy. *Syn.* UNGUENTUM HEDERÆ, L. *Prep.* From the leaves of common ivy, by infusion, as ointment of henbane. Used as an application to soft corns, in itch,

and as a dressing to indolent ulcers and issues.

Ointment of Ju'niper-tar. *Syn.* UNGUENTUM OLÆI PYROLIGNI JUNIPERI, U. CADINUM, L. *Prep.* (Eras. Wilson.) Lard and suet, of each, 6 parts; bees' wax, 4 parts; liquefy by heat, and add of pyroligneous oil of juniper ('huile de cade') 16 parts; with a few drops of any fragrant essential oil, to conceal the smell. In ring-worm, and as a stimulant ointment in some other skin diseases.

Ointment, Kirkland's. See LEAD OINTMENT (Compound).

Ointment of Lard. *Syn.* UNGUENTUM ADIPIS, L. *Prep.* (Ph. L. 1788.) Prepared lard, 2 lbs.; melt, add of rose water, 3 fl. oz.; beat the two well together, then set the vessel aside, and when the whole is cold, separate the congealed fat. A simple emollient. See ELDER OINTMENT.

Ointment of Lau'rel. *Syn.* LAURINE OINTMENT; UNGUENTUM LAURINUM, U. LAURINOBILIS, L. *Prep.* 1. (Ph. Lusit.) Suet (softened by heat), 8 oz.; laurel oil (expressed oil of bay), 1 lb.; oil of turpentine, 1½ oz. This is the 'nervine balsam' and 'nervine ointment' of the shops in the Peninsula, and in some other parts of Southern Europe. The Ph. Bat. 1805 added ½ oz. of rectified oil of amber.

2. (P. Cod.) Fresh bay leaves and berries (bruised), of each, 1 lb.; lard, 2 lbs.; as hemlock ointment—Ph. L. Highly esteemed on the Continent as a stimulating friction, in bruises, strains, stiff joints, &c.; and in deafness.

3. (Trade.) From fresh bay leaves, 2 lbs.; bay berries, 1 lb.; neat's-foot oil, 5 pints; boil as last; to the strained oil add, of lard suet, 8 lbs., true oil of bay, ¼ lb., and allow it to cool very slowly, in order that it may 'grain' well. Sold for laurel ointment and common oil of bay.

Ointment of Lead. *Prep.* 1. (UNGUENTUM PLUMBI, U. LITHARGYRI—P. Cod.) *Prep.* 1. Litharge, 3 oz.; distilled vinegar, 4 oz.; olive oil, 9 oz.; mix with heat, and stir until they combine. Camphor, morphia, and opium, are common additions to lead ointment, when an anodyne effect is desirable.

2. (Compound; NEUTRAL OINTMENT, HIGGIN'S O., KIRKLAND'S O.; UNGUENTUM NEUTRALE, U. PLUMBI COMPOSITUM—Ph. L.)

Lead plaster, 2 lbs.; olive oil, 18 fl. oz.; mix by a gentle heat, and add of prepared chalk, 6 oz.; lastly, add of dilute acetic acid, 6 fl. oz., and stir well until the mass has cooled. As a dressing in indolent ulcers, "but its utility is doubtful." (Dr. Garrod.)

Obs. It will be observed that the College has already modified the old formula of this ointment. The vinegar is now the last ingredient added to the mass. "Gradually add the chalk, separately mixed with the vinegar, the effervescence being finished, and stir," &c. (Ph. L. 1836.) See ACETATE OF LEAD, CAR-

BONATE OF L., CHLORIDE OF L., IODIDE OF L.; EYE, GOUTARD'S, LE MORT'S, and other OINTMENTS containing lead.

Ointment, Le Mort's. Carbonate of lead, corrosive sublimate, litharge, and Venice turpentine, of each, 1 oz.; alum, ½ oz.; lard, ½ lb.; vermilion, q. s. to colour.

Ointment of Lu'puline. *Syn.* UNGUENTUM LUPULINÆ, L. *Prep.* (Soubeiran.) Lupuline, 1 part; lard, 3 parts; digest by the heat of a water bath for 5 or 6 hours, and strain. As an anodyne dressing to cancerous ulcers, and as a friction to swollen and painful joints.

Ointment of Lycopo'dium. *Syn.* UNGUENTUM LYCOPODII, L. *Prep.* Lycopodium, 1 dr.; balsam of Peru, ½ dr.; simple ointment, 1 oz. In chaps and excoriations.

Ointment of Mace. *Syn.* UNGUENTUM MACIDIS, L. *Prep.* From mace (beaten to a paste) and palm oil, of each, 1 lb.; purified beef-marrow, 3 lbs.; gently melted together, and strained. Emollient and stimulant; chiefly used as a pomade for the hair. Sold for 'common oil of mace.'

Ointment of Marsh-mal'low. *Syn.* UNGUENTUM ATTHÆE, DIATHÆE, L. *Prep.* 1. (Ph. L. 1746.) Oil of mucilages, 2 lbs.; bees' wax, ½ lb.; yellow resin, 3 oz.; melt them together, then add of Venice turpentine, ½ oz., and stir the mixture until it concretes.

2. (Wholesale.) From palm oil, ½ lb.; yellow resin, 1½ lb.; bees' wax, 2½ lbs.; pale linseed oil, 9 lbs. (say 1 gall.); melt together, and stir until it is nearly cold.

Uses, &c. Emollient and stimulant; seldom used in regular practice, but in great repute amongst the common people. Linseed oil is now almost universally substituted for the oil of mucilages.

Ointment of Master-wort. *Syn.* POMMADE ANTI-CANCÉREUSE DE MILLIUS; UNGUENTUM IMPERITORIE, L. *Prep.* (Beasley.) Powdered master-wort (*Imperatoria Ostruthium*), 1½ oz.; tincture of master-wort, 1 oz.; lard, 2 oz.

Ointment, Mercu'rial. *Prep.* 1. (STRONG MERCURIAL OINTMENT, BLUE O., NEAPOLITAN O.; UNGUENTUM HYDRARGYRI—B. P., Ph. L. E. & D., U. H. FORTIUS, U. CÆRULEUM.) *Prep.* 1. (B. P.) Mercury, 16; prepared lard, 16; prepared suet, 1; rub together until metallic globules cease to be visible. (See also MERCURIAL OINTMENT (Compound).)

2. (Ph. L. & E.) Mercury, 1 lb.; lard, 11½ oz.; suet, ¾ oz.; rub the mercury with the suet and a little of the lard, until globules are no longer visible; then add the remaining lard, and triturate all together.

3. (Ph. D.) Pure mercury and lard, of each, 1 lb.; as before.

Pur., &c. The 'stronger mercurial ointment' of the shops is usually made with a less quantity of mercury than that ordered by the Colleges, and the colour is brought up with finely ground blue black or wood charcoal. This fraud may be detected by its infe-

rior sp. gr., and by a portion being left undissolved when a little of the ointment is treated, first with ether or oil of turpentine, to remove the fat, and then with dilute nitric acid, to remove the mercury. When made according to the instructions of the Ph., its sp. gr. is not less than 1.781 at 60° Fahr. It "is not well prepared so long as metallic globules may be seen in it with a magnifier of 4 powers." (Ph. E.) When rubbed on a piece of bright copper or gold, it should immediately give it a coating of metallic mercury, and a silvery appearance.

The *Ung. hyd. fort.* of the wholesale houses is generally made of mercury, 12 lbs., suet, 1½ lb., and lard, 16½ lbs. It thus contains only ½ instead of ⅓ its weight of mercury. That of the same houses labelled '*Ung. hyd. partes æquales*,' is prepared with mercury, 12 lbs.; suet, 1½ lb.; lard, 18½ lbs.

Uses. This ointment is chiefly used to introduce mercury into the system when the stomach is too irritable to bear it; in syphilis, hepatic affections, hydrocephalus, &c. For this purpose, ⅓ to 1 dr. is commonly rubbed into the inside of one of the thighs until every particle of the ointment disappears. This operation is repeated night and morning, until the desired effect is produced, and should be, if possible, performed by the patient himself. During its administration the patient should avoid exposure to cold, and the use of fermented or acidulous liquors, and his diet should consist chiefly of toast, broth, gruel, milk-and-water, and other inoffensive matters. This ointment has been employed to prevent the 'pitting' in smallpox; and, diluted with 3 or 4 times its weight of lard, in several skin diseases, as a dressing for ulcers, to destroy pediculi, &c. Camphor is often added to this ointment, to increase its activity. With the addition of a little extract of belladonna, or hydrochlorate of ammonia, it forms an excellent anodyne and resolvent friction in painful syphilitic tumours and glandular enlargements.

Obs. The preparation of mercurial ointment according to the common plan is a process of much labour and difficulty, and usually occupies several days. The instructions in the Pharmacopœias are very meagre and unsatisfactory, and, so far as details go, are seldom precisely carried out. Employers grumble, and operatives become impatient, when they find the most assiduous trituration apparently fails to hasten the extinction of the globules. To facilitate matters, various tricks are resorted to, and various contraband additions are often clandestinely made. Among the articles referred to, sulphur and turpentine are those which have been longest known, and, perhaps, most frequently employed for the purpose; but the first spoils the colour, and the other the consistence, of the ointment; whilst both impart to it more or less of their peculiar and respective odours. On the Continent, oil of eggs was formerly very generally

used for the purpose, and is even now occasionally so employed. Nearly half a century ago Mr. W. Cooley clearly showed that the difficulty might be satisfactorily overcome by simply triturating the quicksilver with ⅓ to ⅔ of its weight of old mercurial ointment, before adding the lard; and that the effective power of this substance was in direct proportion to its age, or the length of time it had been exposed to the air. His plan was to employ the 'bottom' and 'scrapings' of the store pots for the purpose. At a later period (1814-5), Mr. Higginbottom, of Northampton, repeated this recommendation, and at length the plan has been imported into the Pharmacopœia Borussica. About twenty years since, "we reopened an investigation of the subject, which extended over several months, during which we satisfied ourselves of the accuracy of the assertion of M. Roux, that the mercury in mercurial ointment exists entirely, or nearly so, in the metallic state, and not in the form of oxide, as was generally assumed. We succeeded in preparing an excellent sample of mercurial ointment by agitating washed suet and quicksilver together *in vacuo*. The quantity of oxide present at any time in this ointment is variable and accidental, and is largest in that which has been long prepared; but in no case is it sufficient to materially discolour the fat after the metallic mercury is separated from it. We were led to conclude that the property alluded to, possessed by old ointment, depends solely on the peculiar degree of consistence or viscosity of the fat present in it, and on the loss of much of the thoroughly greasy, 'anti-attributive' character, possessed by the latter in a recent state. In practically working out this idea, we obtained pure fats (MAGNETIC ADEPS; SEVUM PRÆPARATUM), which, without any addition, were capable of reducing, in a few minutes, 8, 16, 32, and even 48 times their weight of mercury. We also found that the formula of the Pharmacopœia might be adopted, and that a perfect ointment might be readily obtained by skilful management in from ½ an hour to an hour, even without these resources. All that was necessary was to employ a very gentle degree of heat, by either performing the operation in a warm apartment or by allowing the mortar to remain filled with warm water for a short time before using it. Suet or lard, reduced either by gentle warmth or by the addition of a little almond oil to the consistence of a thick cream, so that it will hang to the pestle without running from it, will readily extinguish 7 or 8 times its weight of running mercury by simple trituration. The exact temperature must, however, be hit upon, or the operation fails. This fact was afterwards noticed in the '*Ann. de Chim.*,' and some other journals." (A. J. Cooley.)

M. Pomonti has proposed a method of preparing strong mercurial ointment, which, modified to suit the English operator, is as fol-

lows:—Fresh lard, 8 parts; solution of nitre (see *below*), 1 part; mix by trituration, add of mercury, 32 parts, and again triturate. The globules disappear after a few turns of the pestle, but reappear in a few minutes, and then again disappear to return no more. When this happens, the trituration is to be continued for a few minutes longer, when lard, 24 parts, is to be rubbed in, and the ointment at once put into pots. It is said that the globules are so completely extinguished as to escape detection, even when the ointment is examined by a microscope of low power. The SOLUTION.—Nitre, 100 grs.; water, 1 fl. oz.; dissolve. This quantity is sufficient for a kilogramme of mercury. See OINTMENT OF OXIDE OF MERCURY.

Ointment, Mercurial (Milder), Milder Blue Ointment, TROOPER'S O., UNCTION; UNGUENTUM HYDRARGYRI MITIUS, U. CÆRULEUM MITIUS. *Prep.* 1. Stronger mercurial ointment, 1 lb.; lard, 2 lbs.

Uses, &c. In the itch and several other cutaneous diseases, as a dressing to syphilitic ulcers, to destroy pediculi on the body, &c. Each drachm contains 10 grs. of mercury. That of the shops generally contains considerably less.

2. (With SOAP; UNGUENTUM HYDRARGYRI SAPONACEUM; SAVON MERCURIEL).—*a.* (Drapier.) Mercurial ointment (softened by a gentle heat), 1 oz.; hydrate of potassa, 1 dr., dissolved in water, $\frac{1}{2}$ fl. oz.; triturate them together until the mass solidifies.

6. (Swediaur.) Milder mercurial ointment, 8 parts; soft soap, 2 parts; camphor, 1 part. In perioritis, engorgements of the testicles, soft corns, &c. See OINTMENT OF NITRATE OF MERCURY, &c.

Ointment, Mercurial (Compound), B. P. Mercurial ointment, 6; yellow wax, 3; olive oil, 3; camphor, 1 $\frac{1}{2}$. Melt the wax and oil, and when the mixture is nearly cold, add the camphor in powder and the mercurial ointment, and mix.

Ointment of Mezezon. *Syn.* UNGUENTUM MERZERI, L. *Prep.* 1. (Hamb. Cod.) Alcoholic extract of mezereon, 2 drs.; dissolve in rectified spirit, q. s.; add it to white wax, 1 oz., lard, 8 oz., and mix by a gentle heat.

2. (P. Cod.) Mezereon (dried root-bark), 4 oz.; moisten it with rectified spirit, bruise it well, and digest it for 12 hours, at the heat of boiling water, in lard, 14 $\frac{1}{2}$ oz.; then strain with pressure, and allow it to cool slowly; lastly, separate it from the dregs, remelt it, and add of white wax, 1 $\frac{1}{2}$ oz. Used as a stimulating application to blistered surfaces and indolent ulcers.

Ointment of Mustard. *Syn.* UNGUENTUM SINAPIS, L. *Prep.* 1. Flour of mustard, $\frac{3}{4}$ oz.; water, 1 fl. oz.; mix, and add, of resin cerate, 2 oz.; oil of turpentine, $\frac{1}{2}$ oz. Rubefacient and stimulant. As a friction in rheumatism, &c.

2. (Frank.) Flour of mustard, 3 oz.; oil of

almonds, $\frac{1}{2}$ fl. oz.; lemon juice, q. s. In sunburn, freckles, &c.

Ointment of Naphthalin. *Syn.* UNGUENTUM NAPHTHALINÆ, L. *Prep.* (Emery.) Naphthalin, $\frac{1}{2}$ dr.; lard, 7 $\frac{1}{2}$ drs. In dry tetters, lepra, psoriasis, &c.

Ointment, Neapolitan. See MERCURIAL OINTMENT.

Ointment, Nervine. *Syn.* BALSAMUM NERVINUM, UNGUENTUM N., L.; BAUME NERVAL, Fr. *Prep.* (P. Cod.) Expressed oil of mace and ox-marrow, of each, 4 oz.; melt by a gentle heat, and add, of oil of rosemary, 2 drs.; oil of cloves, 1 dr.; camphor, 1 dr.; balsam of tolu, 2 drs.; (the last two dissolved in) rectified spirit, 4 drs. In rheumatism, &c. A somewhat similar preparation was included in the Ph. E. 1744.

Ointment, Neu'tral. See COMPOUND LEAD OINTMENT.

Ointment of Nitrate of Mercury. *Syn.* CITRINE OINTMENT, YELLOW O., MERCURIAL BALSAM; UNGUENTUM HYDRARGYRI NITRATIS (B. P., Ph. L. & D.), U. H. N., or U. CITRINUM (Ph. E.), L. *Prep.* 1. (Ph. L.) Mercury, 2 oz.; nitric acid (sp. gr. 1.42), 4 fl. oz.; dissolve, and mix the solution, whilst still hot, with lard, 1 lb., and olive oil, 8 fl. oz., melted together. (For the Milder Ointment, see *below*.)

2. (Ph. E.) Mercury, 4 oz.; nitric acid (sp. gr. 1.500), 8 fl. oz. 6 fl. drs.; dissolve by a gentle heat, add the liquid to lard, 15 oz.; olive oil, 32 fl. oz.; melted together, and whilst the whole are still hot, and mix them thoroughly. "If the mixture does not froth up, increase the heat a little until this takes place. Keep the ointment in earthenware vessels, or glass vessels, secluded from the air." This admirable formula is a modification of that originally introduced into pharmacy by the late Dr. Duncan, of Edinburgh. (For the milder ointment, see *below*.)

3. (Ph. D.) Mercury, 1 oz.; nitric acid (1.500), 1 fl. oz.; (diluted with) water, $\frac{1}{2}$ fl. oz.; dissolve by a gentle heat, and add the liquid to lard, 4 oz.; olive oil, 8 fl. oz.; melted together, and still hot; next "let the temperature of the mixture be raised so as to cause effervescence, and then, withdrawing the heat, stir the mixture with a porcelain spoon until it concretes on cooling."

4. (P. Cod.) Mercury, 3 parts; nitric acid (1.321), 6 parts; lard and oil, of each, 24 parts; as above.

5. (Ph. U. S.) Mercury, 1 oz.; nitric acid (1.42), 14 fl. oz.; lard, 3 oz.; fresh neat's-foot oil, 9 fl. oz.; mix the mercurial solution with the melted fat and oil at 200° Fahr.

6. (B. P.) Mercury, 4; nitric acid, 12; prepared lard, 15; olive oil, 32; dissolve the mercury in the nitric acid with the aid of a gentle heat; melt the lard in the oil by a steam or water bath in a porcelain vessel capable of holding six times the quantity, and while the mixture is hot add the solution of mercury, also hot, and mix them together thoroughly. If the mixture does not froth up, increase the

heat till this occurs. (The heat required for this is from 170° to 180° Fahr.

Uses, &c. Detergent and stimulant. In ring-worm, herpes, itch, porrigo, psoriasis, and some other chronic skin diseases; in various chronic affections of the eyes, especially chronic inflammation and ulceration of the eyelids, 'blear eye,' &c. It "may almost be regarded as specific in psorophthalmia, in the purulent ophthalmia of infants producing ectropium (ever-sion of the eyelids), and in ulcerations of the tarsi (edges of the eyelids)." (A. T. Thomson.) As a dressing to old ulcers, more especially those of a syphilitic character, it is superior to all the other ointments containing mercury; in sore legs, assisted by the internal use of the pill of soap with opium (PIL SAPONIS CUM OPIO), it often acts like a charm when all other modes of treatment have failed. For most of these purposes it should be diluted with from twice to seven times its weight of some simple fatty matter. One of the principal reasons why this ointment is in less general use than its merits deserve, is the very inferior quality of that vended in the shops under the name, arising from almost every druggist preparing some mess of his own, instead of adhering to the College formulae.

Obs. Ointment of nitrate of mercury, faithfully prepared according to the instructions in the Pharmacopœia, possesses a rich golden-yellow colour, and a buttery consistence, and keeps well. Unfortunately, clumsy and careless operators, who regard the Pharmacopœia as a foolish book, which it is quite unnecessary to look into, often fail in their attempts to produce an article of good quality. The difficulty is immediately surmounted by employing pure ingredients, in the proportions ordered, and mixing them at the proper temperature. The acid should be of the full strength, or, if somewhat weaker than that directed, an equivalent quantity should be employed. A slight excess of acid is not injurious, rather the contrary; but a deficiency of acid, in all cases, more or less damages the quality of the product. If, on stirring the mercurial solution with the melted lard and oil, the mixture does not froth up, the heat should be increased a little, as, unless a violent frothing and reaction take place, the ointment will not turn out of good quality, and will rapidly harden and lose its colour. The most favourable temperature for the union of the ingredients is from 185° to 200° Fahr., and in no case should it exceed 212°; whilst below 180° Fahr., the reactions are feeble and imperfect.

Stoneware or glass vessels must alone be employed in the preparation of this ointment, and the stirrers or spatulas should be either of glass or white deal. The best plan is to keep the whole exclusively for the purpose, and when out of use to preserve them from dust and dirt. (See *below*.)

Ointment of Nitrate of Mercury (Milder). *Syn.* MILDER CITRINE OINTMENT; UNGUEN-

TUM HYDRARGYRI NITRATIS MITTUS (Ph. L.), U. H. N. M., or U. CITRINUM M. (Ph. E.) L. *Prep.* 1. (Ph. L.) Ointment of nitrate of mercury, 1 oz.; lard, 7 oz.; rub them together. "This ointment is to be used recently prepared."

2. (Ph. E.) As the stronger ointment, Ph. E., but using a triple proportion of oil and lard.

Uses, &c. See the STRONGER OINTMENT (*above*).

Ointment of Nitrate of Silver. *Syn.* UNGUENTUM ARGENTI NITRATIS, L. *Prep.* 1. (M. Jobert.) Nitrate of silver, 2, 4, or 6 parts; lard, 20 parts. These ointments are respectively numbered 1, 2, and 3, and are used in white-swelling.

2. (Macdonald.) Nitrate of silver, 1 part; lard, 7 to 8 parts. To smear bougies, in gonorrhœa, &c.

3. (Mackenzie.) Nitrate of silver, 5 grs.; lard, 1 oz. In purulent and chronic ophthalmia, ulcers on the cornea, &c.

4. (Velpeau.) Nitrate of silver, 1 gr.; lard, 1 dr. In acute ophthalmia, &c. The above compounds require to be used with caution.

Ointment of Nitric Acid. *Syn.* OXYGENIZED FAT; UNGUENTUM OXYGENATUM, U. A. NITRICI, L.; POMMADE D'ALYON, Fr. *Prep.* (Ph. D. 1826.) Olive oil, 1 lb.; lard, 4 oz.; melt them together, add, gradually, of nitric acid (sp. gr. 1.500), 5½ fl. drs., and stir the mixture constantly with a glass rod until it concretes.

Uses, &c. In itch, porrigo, and some other chronic skin diseases; and as a dressing for syphilitic and herpetic ulcers, old sores, &c. It is frequently employed as a substitute for the ointment of nitrate of mercury, which it somewhat resembles in appearance; but it is less active and useful.

Ointment of Nitric Oxide of Mercury. *Syn.* OINTMENT OF RED OXIDE OF MERCURY (B.P.), RED PRECIPITATE OINTMENT; UNGUENTUM HYDRARGYRI NITRICO-OXYDI (Ph. L.), U. H. OXYDI (Ph. E.), U. H. O. RUBRI (B. P., Ph. D.), L. *Prep.* 1. (Ph. L.) White wax, 2 oz.; lard, 6 oz.; mix, by heat, add of nitric oxide of mercury, in very fine powder, 1 oz., and rub them together.

2. (Ph. E.) Nitric oxide of mercury, 1 oz.; lard, 8 oz.; mix by trituration.

3. (Ph. D.) Red oxide of mercury (nitric oxide), 1 dr.; ointment of white wax, 7 drs.; as the last.

4. (B. P.) Red oxide of mercury, in very fine powder, 62 grs.; yellow wax, ¼ oz.; oil of almonds, ¾ oz.; melt the wax, add the oil, and mix.

Uses, &c. An excellent stimulant application to indolent and foul sores, ulcers, &c.; and, when diluted, as an eye ointment in chronic inflammation and ulceration of the eyes and eyelids, and especially in psorophthalmia; also in specks on the cornea, and the other affections noticed under OINTMENT OF NITRATE OF MERCURY. It forms the basis of

numerous quack medicines. See also OINTMENT OF OXIDE OF MERCURY (*below*).

Obstetric Ointment. *Syn.* UNGUENTUM OBSTETRICUM, L.; POMMADE OBSTETRICALE, Fr. *Prep.* 1. (Chaussier.) Extract of belladonna, 1 dr.; water, 2 drs.; lard, 1 oz. To promote the dilation of the os uteri.

2. (POMMADE POUR LE TOUCHER.) From yellow wax and spermaceti, of each, 1 oz.; olive oil, 16 oz.; melt them together, strain, add of solution of caustic soda, 1 fl. oz., and stir until the whole is nearly cold.

Ointment of Opium. *Syn.* UNGUENTUM OPIATUM, U. OPII (Ph. L.), L. *Prep.* 1. (Ph. L.) Powdered opium, 20 grs.; lard, 1 oz.; mix by trituration. As a simple anodyne friction or dressing.

2. (Augustin.) Opium, 2 drs.; ox-gall, 2 oz.; digest 2 days, strain, and add, of melted lard, 2 oz.; oil of bergamot, 10 drops.

3. (Brera.) Opium, 1 dr.; gastric juice of a calf, $\frac{1}{2}$ oz.; digest 24 hours, and add of melted lard, 1 oz.

Ointment of Oxide of Lead. See LEAD OINTMENT.

Ointment of Oxide of Man'ganese. *Syn.* UNGUENTUM MANGANESEI OXYDI, U. M. BINOXYDI, L. *Prep.* 1. Black oxide of manganese (levigated), 1 dr.; lard, 1 oz.; mix by patient trituration. As a friction in scrofulous swellings and indurations; and in itch, scald-head, chilblains, &c.

2. (W. Cooley.) Binoxide of manganese, 1 dr.; sulphur, 2 drs.; lard, 9 drs.; cajeput oil, 15 drops. As the last; also as a friction in rheumatism, swelled joints, &c., and in porigo, and some other skin diseases.

Ointment of Oxide of Mer'cury. Under this name the two ointments noticed below are often confounded, owing to the different opinions held respecting the atomic weight of mercury:—

1. **Ointment of Gray Oxide of Mer'cury.** *Syn.* OINTMENT OF SUBOXIDE OF MERCURY, O. OF PROTOXIDE OF M.; UNGUENTUM HYDRARGYRI OXYDI, U. H. SUBOXYDI, U. H. O. CINEREI, L. *Prep.* 1. (Ph. E. 1817.) Gray oxide of mercury, 1 oz.; lard, 3 oz.; triturate together. Formerly proposed as a substitute for mercurial ointment, but in practice it has been found useless as a friction, owing to the unctuous matter only being absorbed, whilst the oxide is left on the surface. This objection does not apply to the following preparations:—

2. (Donovan.) Gray oxide of mercury, 20 grs.; lard, 1 oz.; mix, and expose them to the temperature of 320° Fahr. for 2 hours, constantly stirring. Gray coloured. It may also be made from the nitric or red-oxide in the same way, by keeping the ointment heated to about 300° for some hours. Cleaner and stronger than Ung. hyd. fort.—Ph. L.

3. (Tyson.) Black oxide of mercury (prepared by decomposing precipitated calomel with liquors of potassa and ammonia), 2 oz.;

lard, 1 lb.; triturate together. Inferior in activity to the last. It closely resembles in appearance a fine sample of mercurial ointment.

2. **Ointment of Red Oxide of Mercury.** *Syn.* UNGUENTUM HYDRARGYRI BINOXYDI, U. H. OXYDI RUBEI, L. *Prep.* (Cazenave.) Red oxide of mercury, 30 grs.; camphor, 5 grs.; lard, 1 oz. Closely resembles ointment of nitric oxide of mercury, over which it, perhaps, possesses some advantage from the oxide being in a more minutely divided state.

Ointment of Oxide of Silver. UNGUENTUM ARGENTI OXYDI, L. *Prep.* (Serre.) Oxide of silver, 16 to 20 grs.; lard, 1 oz. As a dressing for scrofulous and syphilitic sores, &c.

Ointment of Oxide of Zinc. *Syn.* ZINC OINTMENT; NIHIL ALBUM OINTMENT; UNGUENTUM ZINCI (B. P., Ph. L. E. & D.), U. OXYDI ZINCI, L. *Prep.* 1. (Ph. L.) Oxide of zinc, 1 oz.; lard, 6 oz.; mix them together.

2. (Ph. E.) Oxide of zinc, 1 oz.; simple liniment (Ph. E.), 6 oz.

3. (Ph. D.) Ointment of white wax, 12 oz.; melt it by a gentle heat, add of oxide of zinc, 2 oz.; and stir constantly until the mixture concretes.

4. (B. P.) Oxide of zinc, in very fine powder, 1; benzoated lard, $\frac{5}{8}$; mix.

Uses, &c. Astringent, desiccative, and stimulant; in excoriations, burns, various skin diseases attended by profuse discharges, in chronic inflammation of the eyes depending on relaxation of the vessels, in sore nipples, indolent sores, ring-worm of the scalp, &c. It is an excellent and very useful preparation. See TUTTY OINTMENT (*below*).

Ointment of Pepper. *Syn.* UNGUENTUM PIPERIS NIGRI, L. *Prep.* 1. Black pepper (bruised), 1 oz.; lard, 2 oz.; suet, 1 oz.; digest together in a covered vessel, by the heat of a water bath, for six hours, then strain, with pressure, add of expressed oil of mace, 2 drs., and stir until the mixture concretes. In piles, itch, as a friction in rheumatism, &c.

2. (Ph. D. 1826.) Black pepper (in fine powder), 4 oz.; lard, 1 lb.; mix. In scald-head, &c.

Ointment of Phosphoric Acid. *Syn.* UNGUENTUM ACIDI PHOSPHORICI, L. *Prep.* (Soubéiran.) Phosphoric acid, 1 dr.; lard (softened by heat), 1 oz.; triturate carefully together. As a friction in caries, osseous tumours, &c.

Ointment of Phosphorus. *Syn.* UNGUENTUM PHOSPHORI, U. PHOSPHORATUM, L. *Prep.* (P. Cod.) Phosphorus, 1 dr.; lard, 6 oz. 3 drs.; melt together (in a wide-mouthed bottle) by the heat of a water bath, remove the vessel from the heat, and shake it briskly until the ointment concretes. As a friction in gout, chronic rheumatism, and several skin diseases.

Ointment of Picrotox'in. *Syn.* UNGUENTUM PICTOTOXINÆ, L. *Prep.* (Jäger.) Picrotoxin, 10 grs.; lard, 1 oz. In ring-worm of

the scalp, and to destroy pediculi. It should be used with care.

Ointment for Piles. *Syn.* UNGUENTUM HÆMORRHOIDALE, U. ANTI-HÆMORRHOIDALE, L. *Prep.* 1. Burnt alum and oxide of zinc, of each, $\frac{1}{2}$ dr.; lard, 7 drs.

2. (Bories.) Acetate of lead, 15 grs.; freshly burnt cork, $\frac{1}{2}$ oz.; washed fresh butter, 2 oz.; triturate well together.

3. (W. Cooley.) Morphia, 8 grs.; melted spermaceti ointment, 1 oz.; triturate together until solution is complete, then add of galls (in impalpable powder), $1\frac{1}{2}$ dr., essential oil of almonds (genuine crude), 12 to 15 drops, and stir until the mass concretes. In painful piles, prolapsus, &c. It is not only very effective, but does not soil the linen so much as most other ointments.

4. (Dr. Gedding.) Carbonate of lead, 4 drs.; sulphate of morphia, 15 grs.; stramonium ointment, 1 oz.; olive oil, q.s. When there is much pain and inflammation.

5. (Sir H. Halford.) Ointment of nitrate of mercury and oil of almonds, equal parts, triturated together.

6. (Mazzini.) Nitrate of morphia, 15 grs.; citrine ointment, 1 dr.; fresh butter, 1 oz. As the last.

7. (Vallez.) Extract of elder leaves, $\frac{1}{2}$ dr.; burnt alum, 16 grs.; poplar ointment, 1 oz. For other formulæ, see the respective names of their leading ingredients.

8. (Ware.) Camphor, 1 dr.; simple ointment, 1 oz.; dissolve by heat, add of powdered galls, 2 drs.; mix well, further add of tincture of opium, 2 fl. drs., and stir until the whole is cold. In flabby mucous and painful piles.

9. (Zanin.) Spermaceti ointment, 1 oz.; powdered galls, 1 dr.; powdered opium, 18 grs.; solution of diacetate of lead, 1 fl. dr. When there is both pain and inflammation.

Ointment of Pitch. *Syn.* BLACK BASILICON, OINTMENT OF BLACK PITCH; UNG. PICIS (B.P., Ph. L.), U. PICIS NIGRÆ, L. *Prep.* 1. (Ph. L.) Black pitch, resin, and bees' wax, of each, 1 l. oz.; olive oil, 1 pint; melt together, strain through a linen cloth (and stir until the mass concretes).

2. (B. P.) Tar, 5; yellow wax, 2; melt together, and stir till cold.

Uses, &c. Stimulant and detergent; very useful in indolent ulcerations, scald-head, and various foul eruptions. In itch and psoriasis, and other scaly skin diseases, a little sulphur is commonly added to it.

Oil of Platinum. *Syn.* UNGUENTUM PLATINI, L. *Prep.* (Hæfer.) Bichloride of platinum, 15 grs.; extract of belladonna, $\frac{1}{2}$ dr.; lard, 1 oz. As a dressing for painful indolent ulcers.

Ointment of Plumbago. *Syn.* OINTMENT OF GRAPHITE; UNGUENTUM GRAPHITIS, U. PLUMBAGINIS, L. *Prep.* From pure plumbago ('black-lead'), $1\frac{1}{2}$ dr.; lard, 1 oz. As a dressing to ulcers, and in certain skin diseases.

Plunket's Ointment. *Prep.* (Original formula.) Crowsfoot, 1 handful; dog's fennel, 3

sprigs; pound well, add of flowers of sulphur and white arsenic, of each, 3 thimblefuls; beat them well together, form the mass into boluses, and dry them in the sun. For use, powder them; and mix the powder with yolk of egg, spread a little on a small piece of pig's bladder (size of half a crown), and apply it to the sore, where it must remain until it falls off by itself. Poisonous; in cancer; with great caution.

Poma'tum Ointment. See LARD OINTMENT.

Ointment of Pop'lar Buds. *Syn.* UNGUENTUM POPULEUM, L. *Prep.* 1. Fresh poplar buds (bruised), 1 part; lard, 4 parts; boil until crisp, and strain. It never gets rancid. Emollient and stimulant.

2. (Compound—P. Cod.) Poplar buds, 12 oz.; fresh leaves of belladonna, common nightshade (*Solanum nigrum*), henbane, and poppies, of each, 8 oz.; lard, 4 $\frac{1}{2}$ lbs.; as the last. Emollient, stimulant, and anodyne.

Ointment of Potas'sio-tar'trate of An'timony.

Syn. ANTIMONIAL OINTMENT, TARTAR EMETIC O.; UNGUENTUM ANTIMONII TARTARATI (B.P.), UNGUENTUM ANTIMONII POTASSIO-TARTARIS (Ph. L.), U. A. TARTARIZATI (Ph. D.), U. ANTIMONIALE (Ph. E.), U. TARTARI EMETICI, L. *Prep.* 1. (Ph. L. & E.) Potassio-tartrate of antimony, rubbed to a very fine powder, 1 oz.; lard, 4 oz.; mix by trituration.

2. (Ph. D.) Tartar emetic, in very fine powder, 1 dr.; ointment of white wax, 7 drs.

3. (B. P.) Tartarated antimony (in fine powder), 1; simple ointment, 4; mix.

Uses, &c. Counter-irritant; in phthisis, chronic rheumatism, certain liver affections, and other deep-seated pains and diseases. A portion, about the size of a nut, is rubbed on the skin night and morning, until a crop of pustules is produced. The part should be well rubbed with a coarse towel, so as to be reddened, before applying the ointment. The product of the Dublin formula is of only half the strength of those of the other Colleges.

Obs. Before adding the tartar emetic to the lard it should be reduced to the state of an impalpable powder. The precipitated salt is the best for this purpose. As the pustules formed by this ointment permanently mark the skin, it should only be applied to those parts of the person which are covered by the dress.

Pur'gative Ointment. See OINTMENT OF COLICENTH, WORM O., &c.

Ointment of Quinine. *Syn.* UNGUENTUM QUININÆ, U. QUININÆ SULPHATIS, L. *Prep.* 1. Sulphate of quinine, 1 dr.; lard, 3 drs. In the agues of children.

2. (Beasley ex Antonini.) Sulphate of quinine, 1 dr.; alcohol (rectified spirit), 2 drs.; sulphuric acid, 10 drops; dissolve, and mix it with lard, $\frac{1}{2}$ oz. In malignant intermittents; 2 to 4 drs. at a time, rubbed into the groin or axilla.

Ointment of Red Sulphuret of Mercury.

Syn. UNGUENTUM HYDRARGYRI BISULPHURETI, U. S. SULPHURETI RUBRI, L. *Prep.* 1. (Alibert.) Red sulphuret of mercury, 1 dr.; camphor, 20 grs.; simple ointment, 1 oz. In herpes, applied twice a day.

2. (Collier.) Bisulphuret of mercury, 1½ dr.; sal ammoniac, ½ dr.; lard, 1 oz.; rose water, 1 fl. dr. In several skin diseases, to diminish the itching, destroy pediculi, &c.

3. (Radius.) As the last, with 1 ℥. more lard. *Ointment of Res'in.* *Syn.* YELLOW BASILICON; UNGUENTUM RESINÆ (Ph. D.), U. RESINOSUM (Ph. E.), L. *Prep.* 1. (Ph. D.) Yellow wax, ¼ lb.; yellow resin, in coarse powder, ½ lb.; prepared lard, 1 lb.; melt them together by a gentle heat, strain the mixture, whilst hot, through flannel, and stir it constantly until it concretes.

2. (Ph. E.) Bees' wax, 2 oz.; resin, 5 oz.; lard, 8 oz.

Obs. A useful stimulant dressing to foul and indolent ulcers. For the corresponding preparation of the Ph. L., see RESIN CERATE (page 314).

Ointment, Resol'vent. See DISCUTIENT OINTMENT.

Ointment, Ring'-worm. UNGUENTUM CONTRA-TINEAM, L. *Prep.* 1. Carbonate of soda, 1 part; fresh-slaked lime, 4 parts; lard, 120 parts.

2. Ointment of nitrate of mercury, 1 dr.; tar ointment and lard, of each, ½ oz.

3. (Henke.) Hydrochloric acid, 1 fl. dr.; juniper-tar ointment, ½ oz.; marsh-mallow do., 1 oz.

4. (Pereira.) Tar, 3 drs.; lard, 1½ oz.; melt them together, and stir in of acetic acid (Ph. L.), 2 fl. drs.

5. (Thompson.) Carbonate of soda and sulphuret of potassium, of each, 1 dr.; creasote, ½ dr.; lard, 1½ oz.

Obs. The hair must be cut off close, and the part washed clean before each application. For other forms, see *above*.

Ointment of Rose. *Syn.* ROSE POMMADE, ROSE LIP-SALVE; UNGUENTUM ROSÆ, U. ROSATUM, L. *Prep.* 1. (P. Cod.) Washed lard (melted), and roses (centif.), of each, 2 lbs.; mix, and in 2 days remelt the mass, and press out the fat; to this last add of fresh roses, 2 lbs.; and repeat the process; lastly, colour it with alkanet root, if required red.

2. (UNG. AQUÆ ROSÆ—Ph. U. S.) This is spermaceti ointment melted and beaten up with about ⅓rds of its weight of rose water until they congeal. Both the above are simple emollients. The last is an official 'cold cream.'

Ointment, Rust's. *Prep.* Calcined alum, 1½ dr.; camphor, ½ dr.; powdered opium, 20 grs.; balsam of Peru, 1 dr.; lead ointment, 5 drs.; triturate together. In chilblains, frostbites, frosted limbs, &c.

Ointment of Sabadil'line. *Syn.* UNGUENTUM SABADILLINÆ, L. *Prep.* (Dr. Turnbull.) Sabadilline, 15 to 20 grs.; lard, 1 oz. Intended as a substitute for ointment of veratrine.

Ointment of Savine. *Syn.* UNGUENTUM SABINÆ (Ph. L. & D.), CERATUM SABINÆ, L. *Prep.* 1. (Ph. L.) White wax, 3 oz.; lard, 1 lb.; melt them together, mix in of fresh savine (bruised), ½ lb., and press through a linen cloth.

2. (Ph. D.) Savine tops, dried and in fine powder, 1 dr.; ointment of white wax, 7 drs.; mix by trituration. For the formula of the Ph. E., the uses, &c., see CERATE.

Ointment of Scrophula'ria. *Syn.* UNGUENTUM SCROPHULARIÆ, L. *Prep.* (Ph. D. 1826.) Green leaves of knotted rooted figwort and lard, of each, 2 lbs.; prepared suet, 1 lb.; boil till crisp, and strain with pressure. In ring-worm, 'burnt holes' (*pemphigus gangrenosus* of children), impetigo, and some other cutaneous diseases; also as an application to piles, painful swellings, &c. In the second it is said to be almost specific.

Ointment, Simple. *Syn.* OINTMENT OF WHITE WAX, SIMPLE DRESSING; UNGUENTUM SIMPLEX (B. P., Ph. E.), U. CERÆ ALBÆ (Ph. D.), L. *Prep.* 1. (Ph. E.) Olive oil, 5½ fl. oz.; white wax, 2 oz.; melted together, and stirred whilst cooling.

2. (Ph. D.) Prepared lard, 4 lbs.; white wax, 1 lb.; as the last.

3. (B. P.) White wax, .2; prepared lard, 3; almond oil, 8; melt together, and stir till it becomes solid.

Obs. The above are mild emollients, useful in healthy ulcers, excoriations, &c.; but chiefly as forming the basis for other ointments. The corresponding preparation of the Ph. L. is spermaceti ointment. See *below*, also LARD OINTMENT, &c.

Ointment, Singleton's. See EYE OINTMENTS.

Ointment, Small-pox. *Syn.* UNGUENTUM ECTROTICUM, L. *Prep.* 1. Mercurial ointment, 1½ oz.; bees' wax and black pitch, of each, ½ oz.; expressed oil of mace, 2 drs.; mixed together by a very gentle heat.

2. (Briquet.) Mercurial ointment, 4 parts; powdered starch, 1 part.

3. (Tourriere.) Iodide of potassium (dry and in fine powder), 1 part; expressed oil of mace, 2 parts; black resin, 4 parts; mercurial ointment, 8 parts. Used to prevent the 'pitting' of the pustules. See SMALLPOX.

Ointment, Smellome's. See EYE OINTMENTS.

Ointment of Soap. 1. See CERATE.

2. (Camphorated; UNGUENTUM SAPONIS CAMPHORATUM—Hamb. Cod.) White soap (scraped), 1 lb.; water, 1 lb.; dissolve by heat; add of olive oil, 5 oz.; and when the mixture has partly cooled, further add of camphor, 1 oz., previously dissolved by heat in olive oil, 1 oz.; lastly, stir until the mass concretes. As an anodyne and stimulating friction in various local affections, as chaps, chilblains, rheumatism, &c.

Ointment of So'dio-Chlo'ride of Gold. *Syn.* UNGUENTUM AURI SODIO-CHLORIDI, L.; POM-

MADE DE MURIATE D'OR ET DE SOUDE, Fr. *Prep.* (Magendie.) Sodio-chloride of gold, 10 grs.; lard, 4 drs. In scrofulous and syphilitic swellings, indurations, ulcers, &c.

Ointment of Spermaceti. *Syn.* EMOLLIENT DRESSING, SIMPLE OINTMENT, WHITE O.; UNGUENTUM CETACI (B. P., Ph. L. & D.), U. SPERMATIS CETI, L. *Prep.* 1. (Ph. L.) Spermaceti, 5 oz.; white wax, 1½ drs.; olive oil, 1 pint, or q. s.; melt them together by a gentle heat, and stir the mixture until cold.

2. (Ph. D.) White wax, ½ lb.; spermaceti, 1 lb.; prepared lard, 3 lbs.; as the last.

3. (B. P.) Spermaceti, 5; white wax, 2; almond oil, 20, or a sufficiency; stir constantly till it cools.

Uses, &c. As an emollient and healing application or dressing to abrasions, excoriations, blistered surfaces, healthy ulcers, chilblains, chaps, &c. In trade, the Dublin formula, with double the amount of lard, is commonly employed. See LARD OINTMENT, SIMPLE O., &c.

Ointment of Squills. *Syn.* UNGUENTUM SCILLÆ, L. *Prep.* 1. (Brera). Squills (in very fine powder), 1 dr.; mercurial ointment, 2 drs.

2. (Hufeland.) Squills, 1 oz.; liquor of potassa, 2 fl. oz.; reduce to a mucilage by boiling, then add of lard, 2 oz. or q. s. As a resolvent friction to indolent tumours and indurations.

Ointment of Stavesacre. *Syn.* UNGUENTUM STAPHISAGRIÆ, L. *Prep.* (Swediaur.) Powdered stavesacre, 1 oz.; lard, 3 oz.; melt together, digest 3 or 4 hours, and strain. A very cleanly remedy for itch, and to destroy pediculi on the person. A similar ointment is much used by farriers.

Ointment of Stramonium. *Syn.* UNGUENTUM STRAMONII, L. *Prep.* 1. Fresh thorn-apple leaves, 1 part; lard, 4 parts; as ointment of hemlock.

2. (Pereira.) Powdered leaves, 1 oz.; lard, 4 oz.; mix by trituration.

3. (Ph. U. S.) Extract of stramonium, 1 dr.; lard, 1 oz.; as the last.

Uses, &c. To dress irritable ulcers, and as an application to painful piles.

Ointment of Strychnine. *Syn.* UNGUENTUM STRYCHNINÆ, L. *Prep.* 1. (Bouchardat.) Strychnine, 16 grs.; lard, 1 oz.; carefully triturated together.

2. (Wendt.) Nitrate of strychnine, 6 grs.; lard, 1 oz.; as last. Both are used as a friction in paralysed parts, &c. From the extremely poisonous character of strychnine, it should be used with caution.

Ointment of Subacetate of Cop'per. See VERDIGERIS OINTMENT.

Ointment of Subacetate of Lead (Compound). *Syn.* UNGUENTUM PLUMBI SUBACETATIS COMPOSITUM (B. P.). *Prep.* Solution of subacetate of lead, 6; camphor, ½; white wax, 8; almond oil, 20; melt the wax with 16 of the oil on a steam- or water-bath; remove the

vessel, and as soon as the mixture begins to thicken, gradually add the solution of subacetate of lead, and stir the mixture constantly until it cools; then add the camphor, dissolve in the rest of the oil, and mix thoroughly.

Ointment of Subchloride of Mercury. See OINTMENT OF CALOMEL.

Ointment of Subsulphate of Mercury†. *Syn.* UNGUENTUM HYDRARGYRI SUBSULPHATUS, L. *Prep.* 1. (Alibert.) Turpeth mineral, ½ dr.; lard, 1 oz.

2. (Bielt.) Turpeth mineral, 1 dr.; sulphur, 2 drs.; lard, 2 oz.; oil of lemons, 15 drops. In herpes, porrigo, and the scaly skin diseases.

Ointment of Sulphate of Iron. *Syn.* UNGUENTUM FERRI SULPHATIS, L. *Prep.* (Velpéau.) Sulphate of iron, 1½ dr.; simple ointment, 1 oz. In erysipelas.

Ointment of Sulphate of Man'ganese. *Syn.* UNGUENTUM MANGANESI SULPHATIS, L. *Prep.* From sulphate of manganese, 1 dr.; lard or simple ointment, 1 oz. Alternative and discutient; in similar cases to those in which MERCURIAL OINTMENT is employed.

Ointment of Sulphate of Zinc. *Syn.* UNGUENTUM ZINCI SULPHATIS, L. *Prep.* (Scarpa.) Sulphate of zinc (in very fine powder), 1 dr.; lard, 1 oz. In some chronic skin diseases attended with a lax state of the tissues, and as a dressing to scrofulous tumours after they have separated and the abscess has been discharged.

Ointment of Sulphur. *Syn.* UNGUENTUM SULPHURIS (B. P., Ph. L. E. & D.). *Prep.* 1. (Ph. L.) Sulphur, ½ lb.; lard, 1 lb. In the Ph. L. 1836 oil of bergamot, 40 drops, were added. (See 4, Compound.)

2* (Ph. E.) Sulphur, 1 oz.; lard, 4 oz.

3. (Ph. D.) Sulphur, 1 lb.; lard, 4 lbs.

4. (B. P.) Sublimed sulphur, 1; benzoated lard, 4; mix.

Uses, &c. In itch, scald-head, &c., in the first of which it is specific. It should be well rubbed in every night until the disease is cured; "but not more than one fourth part of the body should be covered with it at a time." (A. T. Thomson.)

5. (Compound; ITCH OINTMENT; UNGUENTUM SULPHURIS COMPOSITUM—Ph. L.)—*a.* (Ph. L.) Nitrate of potassa (powdered), 40 grs.; white hellebore (powdered), 10 drs.; sulphur and soft soap, of each, 4 oz.; lard, 1 lb.; rub them together.

6. (P. Cod.) Alur and sal ammoniac, of each, ½ oz.; sulphur, 8 oz.; lard, 16 oz.

Uses, &c. In itch, as the simple ointment (1, 2, and 3). They are more efficacious, but, owing to the presence of white hellebore, the Ph. L. preparation is apt to cause irritation in persons with delicate skins. See ITCH OINTMENT.

Ointment of Sulphuret of Mercury. See OINTMENT OF RED SULPHURET OF MERCURY.

Ointment of Sulphurated Potash. *Syn.* UNGUENTUM POTASSÆ SULPHURATÆ (B. P.). Sul-

phurated potash, 30 grs.; triturate, and add prepared lard, 1 oz.; mix. See also next preparation.

Ointment of Sulphuret of Potassium. *Syn.* UNGUENTUM POTASSII SULPHURETI, L. *Prep.* 1. Sulphuret of potassium (dry and in fine powder); 1 dr.; lard, 9 drs. Alibert adds 1 dr. of carbonate of soda.

2. Sulphuret of potassium, 2½ drs.; lard and soft soap, of each, 1 oz.; olive oil, ½ oz. In several chronic skin diseases, as itch, psoriasis, ring-worm, lepra, eczema, &c.

Ointment of Sulphuret of Sodium. *Syn.* UNGUENTUM SODII SULPHURETI, L. *Prep.* (Swediaur.) Sulphuret of sodium, 3 drs.; lard, 1½ oz. In itch, for which it is very cleanly and effective. The last two ointments are most powerful when recently prepared.

Ointment of Sulphuric Acid. *Syn.* UNGUENTUM ACIDI SULPHURICI, L. *Prep.* 1. (Dr. Duncan.) Sulphuric acid, 1 dr.; lard, 2 oz.

2. (Ph. D. 1826.) Sulphuric acid, 1 dr.; lard, 1 oz.; mix.

Uses, &c. Black, fetid; in itch. It is now seldom used. With oil of turpentine, it has been used as a stimulating liniment in rheumatism. An ointment made of 1½ dr. of dilute sulphuric acid to 1 oz. of lard is a good application in prurigo.

Ointment, Sulta'na. Spermaceti and white wax, of each, ¼ oz.; oil of almonds and butter of cacao, of each, ½ lb.; melt together, add of balsam of Peru, 1 dr., stir constantly for a few minutes, and after it has settled pour off the clear portion; to this add of orange-flower water, 2 fl. drs., and stir the mixture constantly until it concretes. A very agreeable species of cold cream.

Ointment of Tan'nate of Lead. *Syn.* UNGUENTUM PLUMBI TANNATIS, L. *Prep.* 1. Tan'nate of lead, 1½ drs.; powdered camphor, 20 grs.; spermaceti ointment, 7 drs. In inflamed piles, &c.

2. (Sundelin.) Decoction of oak bark, 6 fl. oz.; solution of diacetate of lead, 1½ oz.; mix, collect and drain the precipitate, and mix it, whilst still moist, with lard, 1 oz.; camphor, 10 grs. In bed-sores.

Ointment of Tan'nin. *Syn.* UNGUENTUM TANNINI, U. ACIDI TANNICI, L. *Prep.* (Richard.) Tannin, 2 drs.; water, 2 fl. drs.; triturate them together, then add of lard, 1½ oz. Astringent and hæmomatic. In piles, prolapsus, &c. It is a very cleanly and effective application.

Ointment of Tar. *Syn.* UNGUENTUM PICIS LIQUIDÆ (Ph. L. E. & D.), L. *Prep.* 1. Ph. L.) Tar and suet, of each, 1 lb.; melt them together, and press the mixture through a linen cloth.

2. (Ph. E.) Tar, 5 oz.; bees' wax, 2 oz.; melt together, and stir the mixture briskly until it concretes.

3. (Ph. D.) Tar, ½ pint; yellow wax, 4 oz.; as the last.

Uses, &c. As a detergent application in ring-worm, scald-head, scabby eruptions, foul ulcers, &c. It should be, in general, at first diluted with half of its weight of lard or oil. See also OINTMENT OF PITCH.

Ointment of Tartar Emetic. See OINTMENT OF POTASSIO-TARTRATE OF ANTIMONY.

Ointment of Tobacco. *Syn.* UNGUENTUM TABACI, L. *Prep.* 1. (Chippendale.) Extract of tobacco, 1 dr.; lard, 1 oz. As a friction in neuralgia.

2. (Ph. U. S.) Fresh tobacco leaves, 1 oz.; lard, 12 oz.; as ointment of hemlock. As an anodyne application in irritable ulcers, ring-worm, prurigo, and some other skin diseases.

Ointment, Tripharm'ic. *Syn.* OINTMENT OF THREE THINGS; UNGUENTUM TRIPHARMACUM, L. *Prep.* From lead plaster, 4 oz.; olive oil, 2 fl. oz.; distilled vinegar, 1 fl. oz.; melt together, and stir until they combine, and a proper consistence is obtained. Cooling and desiccative; formerly greatly esteemed as a dressing.

Ointment, Trooper's. See MERCURIAL OINTMENT.

Ointment of Turpentine. *Syn.* UNGUENTUM TEREBINTHINÆ (B. P.). *Prep.* 1. (Guy's Hosp.) Camphor, 1 dr.; oil of turpentine, 1 to 2 fl. drs.; dissolve, and add of resin cerate, 1 oz. As a stimulant and anodyne friction in nephritic and rheumatic pains, engorgements, &c.

2. (Ph. Austr.) Turpentine, 2 lbs.; simple ointment, 1 lb.; mix by a gentle heat. As a stimulant dressing.

3. (B. P.) Oil of turpentine, 16; camphor, 1; soft soap, 2; dissolve the camphor in the turpentine, add the soap, and rub till thoroughly mixed.

Ointment of Tut'ty. *Syn.* UNGUENTUM ZINCI OXYDI IMPURI, U. TUTTIÆ, L. *Prep.* From prepared tutty, 1 part; simple ointment, 5 parts; mix by trituration. Formerly in great repute in ophthalmic practice, more particularly in inflammation, &c., of the eyelids. See OINTMENT OF OXIDE OF ZINC.

Ointment of Veratrine. *Syn.* UNGUENTUM VERATRINÆ (B. P.); POMMADE DE VERATRINE, Fr. *Prep.* 1. (Magendie.) Veratrine, 4 grs.; lard, 1 oz.; mixed by careful trituration.

2. (Pereira.) Veratrine, 30 grs.; lard, 1 oz.

3. (Turnbull.) Veratrine, 10 to 20 grs.; olive oil, 1 dr.; triturate, and add of spermaceti ointment, 1 oz.

4. Veratrin, 8 grs.; prepared lard, 1 oz.; olive oil, ½ dr.; rub the veratrin and the oil together, then mix thoroughly with the lard.

Uses, &c. As a friction in neuralgia, neuralgic rheumatism, gout, dropsy, &c. A piece, about the size of a hazel nut, is to be rubbed for 10 or 15 minutes over the seat of pain, twice a day. It must not be applied where the skin is unsound, nor to a large surface at a time; and the greatest caution must be used, on

account of the extremely poisonous character of veratrine.

Ointment of Verdigris. *Syn.* OINTMENT OF SUBACETATE OF COPPER; UNGUENTUM ÆRUGINIS (Ph. E.), U. CUPRI SUBACETATIS (Ph. D.), L. *Prep.* 1. (Ph. E.) Resinous ointment, 15 oz.; melt by a gentle heat, sprinkle into it of verdigris (in very fine powder), 1 oz., and stir the mixture briskly until it concretes.

2. (Ph. D.) Prepared subacetate of copper, $\frac{1}{2}$ dr.; ointment of white wax, $7\frac{1}{2}$ drs.; mix by trituration.

Uses, &c. Detergent and escharotic; as an occasional dressing to foul and flabby ulcers, to keep down fungous flesh, and, diluted with oil or lard, in scrofulous ulceration and inflammation of the eyelids.

Ointment of Vinegar. *Syn.* ACETIC OINTMENT; UNGUENTUM ACETI, U. ACIDI ACETICI, L. *Prep.* 1. (Dr. Cheston.) Olive oil, 1 lb.; white wax, 4 oz.; melt them together by a gentle heat, add of strong vinegar, 2 fl. oz., and stir until the mixture concretes. As a cooling astringent dressing, and as an application in chronic ophthalmia.

2. (W. Cooley.) Acetate of morphia, 6 grs.; acetic acid (Ph. L.) and water, of each $1\frac{1}{2}$ fl. dr.; dissolve, add the solution to simple ointment (melted), $1\frac{1}{2}$ oz., and stir the mixture briskly until nearly cold. In chronic ophthalmia, painful inflamed piles, &c.; also to remove freckles, and to allay itching and irritation in several skin diseases.

Ointment, White. Both SPERMACEI OINTMENT and OINTMENT OF CARBONATE OF LEAD were formerly so called, but the name is now obsolete. The CAMPHORATED WHITE OINTMENT of the Ph. L. of 1746 (UNG. ALBUM CAMPHORATUM) was spermaceti ointment to which a little camphor had been added.

Ointment of White Precipitate. *Syn.* OINTMENT OF AMMONIATED MERCURY; UNGUENTUM HYDRARGYRI AMMONIATI (B. P.). Ammoniated mercury, 62 grs.; simple ointment, 1 oz.; mix. See OINTMENT OF AMMONIO-CHLORIDE OF MERCURY.

Ointment of White Wax. See SIMPLE OINTMENT.

Ointment of Wolfsbane. See OINTMENT OF ACONITE.

Ointment for Worms. *Syn.* UNGUENTUM ANTHELMINTICUM, U. VERMIFUGUM, L. *Prep.* 1. (Boerhaave.) Aloes and ox-gall, of each, 1 part; marsh-mallow ointment, 8 parts.

2. (Fr. Hosp.) Aloes and oil of tansy, of each, 1 part; dried ox-gall, 2 parts; (both in fine powder;) lard, 8 parts.

3. (Ph. Bat.) Aloes, 1 dr.; dried ox-gall and petroleum, of each, $1\frac{1}{2}$ dr.; lard, $1\frac{1}{2}$ oz.

4. (Soubeiran.) Powdered aloes, 2 drs.; lard, 1 oz.

Uses, &c. The above are purgative and vermifuge, applied as frictions to the abdomen. They are chiefly employed for children and delicate females. See COLOCYNTH OINTMENT.

Ointment of Yellow Wax. *Syn.* UNGUENTUM CERÆ FLAVÆ, L. *Prep.* (Ph. D. 1826.) Bees' wax, 1 lb.; lard, 4 lbs.; melt them together. A mild emollient dressing. Some parties regard it as more 'healing' than the OINTMENT OF WHITE WAX.

Ointment of Zinc. 1. See OINTMENT OF OXIDE OF ZINC.

2. (Compound; UNGUENTUM ZINCI COMPOSITUM, L.)—*a.* (Hufeland.) Oxide of zinc and lycopodium, of each, 1 dr.; simple ointment, 1 oz. In excoriations and simple ulcerations, especially those of the eyelids, nipples, &c.

b. (Thomson.) Oxide of zinc, $\frac{1}{2}$ dr.; powdered opium, 5 grs.; lard, 1 oz. As the last, when there is much pain.

OINTMENTS (Flower of). *Syn.* FLOS UNGUENTORUM, L. *Prep.* From resin, thus, wax, and suet, of each, $\frac{1}{2}$ lb.; olibanum and Venice turpentine, of each, $2\frac{1}{2}$ oz.; myrrh, 1 oz.; wine, $\frac{1}{2}$ pint; boil them together, and, lastly, add of camphor, 2 drs. Suppurative; warming.

OLEFIANT GAS, C₂H₄. *Syn.* ETHYLENE, HEAVY CARBONETTED HYDROGEN, HEAVY CARBURETTED H., ELAYL, ETHENE. A substance discovered by some associated Dutch chemists, in 1795, and composed of carbon and hydrogen in the proportions expressed by C₂H₂, or C₂H₄.

Prep. 1. A mixture of alcohol (rectified spirit), 1 part, and oil of vitriol, 6 parts, is heated in a retort until it blackens, and sulphurous acid begins to be evolved; the product is then passed first through a wash-bottle containing a solution of caustic potassa or milk of lime, and next through a bottle containing concentrated sulphuric acid, the last being furnished with a tube dipping into the water of the pneumatic trough.

2. The vapour of boiling alcohol is passed into a mixture of oil of vitriol diluted with rather less than one half its weight of water, and so heated as to be in a state of tranquil ebullition (320° to 330° Fahr.); the gaseous product is chiefly olefiant gas, and the vapour of water, from which it may be separated as above. No sulphurous acid is formed, nor does the acid blacken as in the last process.

Prop., &c. Colourless; neutral; nearly odourless; nearly insoluble in water; alcohol, ether, and the volatile and fixed oils, absorb a portion of it; burns with a brilliant white flame; at a full red heat it suffers decomposition, with deposit of carbon and liberation of light carburetted hydrogen gas; mixed with twice its volume of chlorine and inflamed, hydrochloric acid is formed, and the carbon of the gas is precipitated in the form of dense black soot; if the mixture (best in equal volumes), instead of being kindled, be left standing over water, it soon condenses into a heavy oily liquid (chloride of olefiant gas, Dutch liquid). Sp. gr. .981; 100 cubic inches weigh 30.57 grs.

Olefiant Gas, Bromide of. *Syn.* BROMIDE OF ETHYLENE. From bromine and olefiant gas,

as Dutch liquid. A colourless liquid, with an ethereal odour, boiling at 265° , and solidifying at 0° Fahr. Sp. gr. 2.16.

Olefant Gas, Chloride of. *Syn.* DUTCH LIQUID, CHLORIDE OF ETHYLENE. This substance, referred to above, may be easily prepared in any quantity by the following process:—Chlorine and olefant gas (the latter a little in excess) are conveyed by separate tubes (passing through the same cork) into a glass globe, having a narrow funnel-shaped neck at its lower part, dipping into a small bottle destined to receive the product of their mutual reaction; the newly formed liquid trickles down the sides of the globe into the receiver, and when a sufficient quantity is collected, it is purified by agitating it first with water, and then with sulphuric acid, and, lastly, submitting it to distillation.

Prop., &c. Colourless; sweet-tasted; agreeably fragrant, the odour approaching that of oil of caraway; slightly soluble in water; freely so in alcohol and ether; it sinks in water; boils at 180° Fahr.; burns with a smoky greenish flame; is unaffected by oil of vitriol; but decomposed by solution of caustic potassa. It combines with chlorine, forming new compounds. See CHLORIDES OF CARBON (page 294).

OLEIC ACID. $\text{HC}_{18}\text{H}_{33}\text{O}_2$. *Syn.* ELAIC ACID. One of the fatty acids discovered by Chevreul, and produced by saponifying oils, and then separating the base from the resulting soap by means of a dilute acid. It now forms an important secondary product in the manufacture of stearic acid. Perfectly pure oleic acid may be obtained as follows:—

1. By saponifying olein, as just noticed.

2. Pure almond or olive oil soap is decomposed by a dilute acid, and the resulting oily acid is digested in a water bath with half its weight of litharge (in very fine powder) for some hours, constantly stirring; the mixture is then agitated with twice its volume of ether in a close vessel, and in 24 hours the clear ethereal solution is decanted, and decomposed with dilute hydrochloric acid; the oleic acid separates, and the ether mixed with it is expelled by evaporation. To render it colourless, the acid is again saponified with caustic soda, and the soap thus obtained is repeatedly dissolved in a solution of soda, and as often separated by adding common salt; this soap is, lastly, decomposed by dilute hydrochloric acid, as before.

Prop. &c. A colourless oily acid, insoluble in water, soluble in alcohol, ether, and oil; with the bases, it forms salts called oleates.

OLEIN. $\text{C}_{57}\text{H}_{104}\text{O}_6$. *Syn.* ELAIN; HUILE ABSOLUE, Fr. The liquid portion of the fixed oils and fats. By saponification, it yields oleic acid.

Prep. 1. Olive oil or almond oil is digested for 24 hours with a quantity of caustic soda lye, only sufficient to saponify one half of the oil, and the undecomposed oily portion (olein) is

then separated from the alkaline solution and newly formed stearine soap.

2. The saponified mixture of oil and alkali (see No. 1) is digested with proof spirit until all the soap is dissolved out, and the olein separates and floats on the surface; the latter, after repose, is decanted.

3. Almond or olive oil is agitated in a stout bottle with 7 or 8 times its weight of strong alcohol (sp. gr. .798), at nearly the boiling-point, until the whole is dissolved; the solution is next allowed to cool, after which the clear upper stratum is decanted from the stearin which has been deposited, and, after filtration, the spirit is removed by distillation at a gentle heat; by exposure at a very low temperature, it deposits any remaining stearin, and then becomes pure.

Prop., &c. The products of the last two formulæ have only a very slight yellow colour, but may be rendered quite limpid and colourless by digestion for 24 hours with a little pure, freshly burnt animal charcoal, and subsequent filtration. In this state the olein is perfectly neutral to test paper, does not in the slightest degree affect metallic bodies immersed in it, and does not thicken by exposure to the greatest cold. Olein is used by watchmakers for their fine work. Some years ago the product of the last formula was sold, by a certain metropolitan house, as 'watchmaker's oil,' at 1s. 6d. a drachm. Commercial olein is generally lard oil. The refined oleic acid of the stearin works also commonly passes under the name. Olein burns well in lamps; but oleic acid does not do so unless when well refined and when the wick-tube is so formed as to remain cool. See LARD OIL and OLEIC ACID.

OLEOMETER. *Syn.* ELAÏOMETER, ELAÏOMETER, OIL-BALANCE. A delicate areometer or hydrometer, so weighted and graduated as to adapt itself to the densities of the leading fixed oils. As the differences of the specific gravities of these substances are inconsiderable, to render it more susceptible the bulb of the instrument is proportionately large, and the tube or stem very narrow. The scale of the oleometer in general use (Gobby's) is divided into 50 degrees, and it floats at 0 or zero in pure poppy oil, at 38 or $38\frac{1}{2}$ in pure almond oil, and at 50 in pure olive oil. The standard temperature of the instruments made in this country is now 60° ; those made on the Continent, 54.5° Fahr. The oil must therefore be brought to this normal temperature before testing it, by plunging the glass cylinder containing it into either hot or cold water, as the case may be; or a correction of the observed density must be made. The last is done by deducting 2 from the indication of the instrument for each degree of the thermometer above the normal temperature of the instrument, and adding 2 for every degree below it. Thus; suppose the temperature of the oil at the time of the experiment is 60° Fahr., and the oleometer indicates 61° ; then—

60·0° Actual temperature.

54·5 Normal temperature.

5·5 Difference.

Indication of the oleometer . . 61·0

The difference $5·5 \times 2 =$. . 11·0

Real density 50·0

Suppose the temperature observed at the time of the experiment is 52°, and the oleometer indicates 45°; then—

54·5 Normal temperature.

52·0 Actual temperature.

2·5 Difference.

Indication of the oleometer . . 45·0

The difference $2·5 \times 2 =$. . 5·0

Real density 50·0

The oil is, therefore, presumed to be pure. See HYDROMETER, OILS (Fixed), and SPECIFIC GRAVITY.

OLEO-PHOSPHORIC ACID. An acid compound found by Fremy in the brain and nervous matter.

OLEO-RES'INS. The natural compounds of resin and essential oil forming the vegetable balsams and turpentine. Copaiba, Canada balsam, and Venice turpentine, are examples. Certain extracts prepared with ether, as the fluid extracts of cubebs and pepper in the Ph. U. S.; may be regarded as oleo-resins. See EXTRACT.

OLEOSACCHARUM. *Syn.* ELEOSACCHARUM. Sugar aromatised or medicated by being rubbed up with an essential oil. The oleosacchara of aniseed, caraway, cinnamon, peppermint, pennyroyal, and the other like essential oils, are made by rubbing 15 to 20 drops of the respective oils with white sugar, 1 oz.—The Ph. Græca 1837 prescribes 1 part of oil to 20 parts of sugar.—The Ph. Austr. 1836 and Ph. Bor. order the same proportions, or 3 drops of oil to the dr., and 24 drops to the oz., of powdered sugar. When intended for making extemporaneous distilled waters, 1 dr. of magnesia is a common addition. The oleosacchara of citrons, lemons, oranges, &c., are made from the peels, as follows:—After cleaning off any specks in the outer rind of the fruit, rub a large piece of loaf sugar on it until the yellow rind is completely removed. Those parts of the sugar which are impregnated with the essence are, from time to time, to be cut away with a knife, and put into an earthen pot. The whole being thus taken off, the sugared essence (oleosaccharum) is to be closely pressed down in the pot, tied over with bladder, and preserved in a cool place for use.

OLIBANUM. *Syn.* OLIBAN, INDIAN OIL-

BANUM, FRANKINCENSE. A gum resin obtained from *Boswellia thurifera* or *serrata*. It is stimulant, astringent, and diaphoretic. It is burnt as incense in the temples of India and in Roman Catholic churches. African or Arabian olibanum is produced by *Boswellia floribunda*. (Royle.) This substance must not be confounded with the resin noticed at page 541.

OLIVE. *Syn.* OLEA, OLIVA, L. The *Olea Europæa* (Linn.), a native of the South of Europe. The unripe fruit is preserved in brine (SPANISH OLIVES, FRENCH OLIVES); the ripe fruit furnishes olive oil; the bark is bitter, astringent, and febrifuge, and has been used as a substitute for cinchona bark; it yields a gum-like substance (OLIVE GUM), which was formerly reported vulnerary, and contains olivile. The olive tree has in all ages been held in peculiar estimation, as the bounteous gift of heaven to man. Some authors have styled it "a mine on earth." It is remarkable for yielding a fixed oil from the pericarp, instead of from the seed.

OLLIVIER'S BISCUITS. See PATENT MEDICINES.

OM'ELET. *Syn.* OMELETTE, Fr. A variety of pancake or fritter made of eggs and other ingredients. Omelets may contain bacon, ham, herbs, fish, shell-fish, cold meat, cold game, fruit, or anything else at hand at the pleasure of the cook. 'Spirit omelets' are made by pouring a little brandy, rum, or whisky over them on serving them up, and setting it on fire for a moment just before placing the dish on the table. "Where is the man or woman cook but says they know how to make an omelette, and that to perfection? But this is rarely the case. It is related of Sarah, the Duchess of Marlborough, that no one could cook a 'fraise,' as it was then called, for the great duke but herself. The great point is, if in an iron pan, it should be very clean and free from damp, which sometimes comes out of the iron when placed on the fire. The best plan is to put it on the fire, with a little fat, and let it get quite hot, or until the fat burns; remove it, and wipe it clean with a dry cloth, and then you will be able to make the omelette to perfection." (Soyer.)

The following formula for a plain omelet is by the above culinary authority:—"Break four eggs into a basin, add $\frac{1}{2}$ teaspoonful of salt, and $\frac{1}{2}$ do. of pepper, and beat them up well with a fork; put into the frying-pan $1\frac{1}{2}$ oz. of butter, lard, or oil, place it on the fire, and, when hot, pour in the eggs, and keep on mixing them quickly with a spoon until they are delicately set; then let them slip to the edge of the pan, laying hold by the handle, and raising it slantways, which will give an elongated form to the omelette; turn in the edges, let it rest a moment, to set, turn it over on to a dish, and serve." "It ought to be of a rich-yellow colour, done to a nicety, and as light and delicate as possible." "2 table-spoonfuls

of milk and 1 oz. of the crum of bread, cut into thin slices, may be added."

MIXED and **FANCY OMELETS** are made by simply dropping the ingredients, cut into dice or fragments, into the above. **ANCHOVY**, **OYSTER**, and **SHRIMP OMELETS** are generally prepared by placing a few spoonfuls of the respective sauces in the centre of each, when nearly dressed.

ONGUENT (de la Mere). A stimulant and digestive ointment, very popular in French pharmacy.

Prep. (P. Cod.) Black pitch, 1 part; butter, lard, litharge, suet and yellow wax, 4 parts; olive oil, 8 parts.

ON'ION. *Syn.* **CEPA, L.** The bulb of *Allium Cepa*. The onion is diuretic, expectorant, rubefacient, and stimulant. The juice, made into a syrup with sugar (**SYRUPUS CEPÆ**), has been given in chronic catarrh, diarrhoea, croup, dropsy, and calculus. Roasted and split open, onions have been applied as poultices to suppurating tumours, and applied to the pubes to relieve suppression of urine in children. According to Dr. Cullen, "onions are acrid and stimulating, and possess little nutrient power. In bilious constitutions they generally produce flatulence, thirst, headache, and febrile symptoms; but where the temperament is phlegmatic, they are of infinite service, by stimulating the system, and promoting the excretions, particularly expectoration and urine." They also possess antiscorbutic and soporific properties.

O'NYX. A sub-species of quartz often wrought into small ornamental articles. Among jewellers, any stone exhibiting layers of two or more colours, strongly contrasted, is called an 'onyx.' A regularly and richly banded agate of this class is much prized for cameos. See **GEMS**.

O'PAL. A mineral allied to agate and chalcedony, but distinguished by its peculiar resinous lustre. The variety most admired as a gem is the precious or noble opal, which is remarkable for its beautiful play of colours. See **GEMS** and **PASTES**.

OPHTHALMIA. *Syn.* **OPHTHALMITIS, L.** Inflammation of the eye. In ordinary cases this disease is confined to the external membrane of the globe of the eye, or to the eyelids; but it occasionally attacks the sclerotica, cornea, choroid coat, and retina.

The common causes of ordinary or conjunctival ophthalmia are the sudden exposure of the organ to a cold easterly wind, to dust, gritty particles, or to any external irritation or injury.

The symptoms are, in part, those common to local inflammation. The eye or eyelids become more or less bloodshot, swollen, and tender, and a sensation resembling that induced by the presence of particles of sand or some gritty substance, accompanied by much heat and a pricking pain, is almost constantly experienced. The secretion becomes yellow-

ish and glutinous, and during the night frequently glues, as it were, the lids together. Sometimes only one eye is attacked, but after 2 or 3 days the disease extends to the other.

The treatment of mild cases of conjunctival ophthalmia is extremely simple. In general, it may be relieved by fomentations of warm water or decoction of poppy-heads and the use of aperient medicines, to which leeches and cupping may often be added with advantage. Severe cases should be treated by the medical practitioner only.

O'PIATES. *Syn.* **OPIATA, L.** Preparations containing opium. The word is often applied in a general sense to anodynes and soporifics. In French pharmacy, the name is commonly used synonymously with confections, as in the following preparations:—

ANTI-DYSENTERIC OPIATE—*Quarin.* Purified opium, 4 grs.; ipecacuanha, $\frac{1}{2}$ dr.; tormentilla, 1 dr.; syrup of whortleberries and conserve of red roses, of each, 6 drs.—*Dose.* A teaspoonful every hour.

ANTI-HYSTERICAL OPIATE—*Trousseau and Reveil.* Powdered indigo, 1 oz.; white honey, 3 oz.—*Dose.* 1 table-spoonful daily, gradually increased until the whole is taken in a day. In hysteria, epilepsy, and nervous affections of an epileptic character.

BALSAMIC OPIATE—*Trousseau and Reveil.* Oleo-resin (balsam) of copaiba, 1 oz.; cubebs (in powder), 3 oz.; potassio-tartrate of iron, $2\frac{1}{2}$ drs.; syrup of quince, q.s. In gleet.—*Dose.* 3 boluses the size of a nut, thrice daily.

CHARCOAL OPIATE—*Ratier.* Willow charcoal (recent), 1 oz.; prepared chalk, 1 dr.; powdered white sugar, 2 oz.; rose water, q.s. to form an electuary. In diarrhoea and incipient cholera, in dysentery with fetid stools, and in gastralgia, flatulence, &c. By substituting calcined magnesia for chalk, it becomes an excellent remedy for habitual constipation.

CUBEBS OPIATE—*Deyeaux.* Powdered cubebs, 4 drs.; powdered camphor, 1 dr.; mix, and divide it into 18 powders.—*Dose.* One, 3 or 4 times daily, in gleet, painful and scalding micturition, &c.

O'PIUM. *Syn.* **OPIUM (B. P., Ph. L. E. & D.), L.** The juice inspissated by spontaneous evaporation, obtained by incision from the unripe capsules of the *Papaver somniferum*, grown in Asia Minor.

Var.—1. **EGYPTIAN**; in roundish flattened lumps; inferior to Turkish opium.—2. **ENGLISH**; often equal to the best Smyrna.—3. **FRENCH**; resembles the last.—4. **GERMAN**; similar to English opium.—5. **INDIAN**;—a. **BENARES**, in large balls;—b. **MALWA**, in roundish flattened cakes, of 9 or 10 oz. in weight each;—c. **PATNA**, in balls or square cakes; inferior to Turkey opium.—6. **LEVANT**; same as Smyrna opium.—7. **PERSIAN**; in rolls or sticks, 6 x $\frac{1}{2}$ inches; inferior; resembles hepatic stones in appearance.—8. **SMYRNA**; in irregular, rounded, flattened

pieces, varying in weight from 2 or 3 lbs. to only as many oz. It forms the best variety of Turkey opium, and is particularly rich in morphia. It is the only one adapted for the manufacture of the salts of morphia, as it contains on the average from 7 to 9% of that alkaloid, and usually yields about 12 to 12.5% of hydrochlorate of morphia, which is more than can be obtained from any other variety of opium.—9. **TURKEY**; of which two varieties are known in commerce, viz., Constantinople opium and Levant or Smyrna opium, noticed above. Constantinople opium is generally in small, flattened, roundish cakes, 2 to 2½ inches in diameter, and covered with poppy leaves. It is more mucilaginous and less esteemed than Smyrna opium, from which it may be distinguished by the last being always covered with the reddish capsules of a species of *Rumex*.

Pur. The opium of commerce is not unfrequently adulterated with extract of poppies, extract of lettuce, lactucarium, mucilage of gum tragacanth, dried leaves, starch, water, clay, sand, gravel, and other substances, in order to increase its weight. This fraud is readily detected by inspection, by chemical analysis, and the microscope; and indirectly, with the greatest certainty, by a simple assay of the sample for its morphia (morphiometry). This may be effected by one or other of the following methods:—

1. (Couverbe.) Opium, 4 parts, and quicklime, 1 part, made into a milk with water, q. s., are boiled together, and the solution filtered whilst hot; dilute hydrochloric acid is then added, to saturation, and the morphia precipitated by the addition of ammonia, any excess of the latter being expelled by heat; the precipitate is then collected, dried, and weighed. If 100 grs. have been operated on, the given weight will represent the percentage richness of the sample in morphia (nearly).

2. (Guilliermond.) 100 grs. of opium are triturated for some time in a mortar along with 4 times its weight of rectified spirit, and the tincture strained through linen, with expression, into a wide-mouthed bottle; the marc is triturated a second time with about 3 times its weight of alcohol, and the tincture strained into the bottle as before; to the mixed tincture is added a fl. dr. of liquor of ammonia, and the whole is agitated for a short time. In about 12 hours the morphia spontaneously separates, accompanied with some narcotina and meconate of ammonium; the morphia covering the interior of the vessel with large, coloured, and gritty crystals, feeling like sand, and the narcotina crystallising in very light, small, white, and pearly needles. These crystals are washed with water, either through a paper filter or linen, to free them from the meconate of ammonia which they contain; after which the narcotina is separated from the morphia by decantation in water, which

removes the narcotina, which is the lighter of the two. According to M. Mialhe, however, the morphia is more effectually removed by washing the crystals with 1 to 1½ fl. dr. of ether, by triturating the two together, when the morphia is left in an insoluble state, and may then be dried and weighed.

3. (Ph. E.) Macerate 100 grs. of opium for 24 hours in 2 fl. oz. of water, filter, and strongly squeeze the residue; then precipitate the solution with carbonate of sodium, ½ oz., dissolved in cold water, 2 fl. oz.; gently heat the precipitate until it shrinks and fuses, then cool and weigh it. It should weigh at least 10 grs., and, when powdered, be entirely soluble in a solution of oxalic acid. See also Watts' 'Dic. of Chemistry,' article, **OPERM.**

Tests. These depend chiefly on the chemical and physical characters of morphia and meconic acid, the tests for which have been already noticed. In operating upon the contents of the stomach, or upon solid organs, in cases of suspected poisoning, the best method of proceeding is that already described under **ALKALOID**.

Another method is to boil the substances in water slightly acidulated with acetic acid, next to evaporate the solution to the consistence of a thick syrup, and then to treat it twice with boiling rectified spirit; the tincture thus obtained is to be filtered when cold, and again evaporated to the consistence of syrup; it is now re-dissolved in distilled water, the filtrate treated with solution of subacetate of lead, and the precipitate of meconate of lead, separated by filtration, and carefully preserved. A current of sulphuretted hydrogen is then passed through the solution, to precipitate excess of lead, and after again filtering it the liquid is evaporated, at first in a water bath, and afterwards under the receiver of an air-pump. The shapeless mass of crystals thus obtained present all the characters of morphia, if the substance examined contained opium. In the mean time the precipitate of meconate of lead is to be boiled with water acidulated with sulphuric acid, and the insoluble sulphate of lead separated by filtration; the filtered liquid, by evaporation, furnishes meconic acid, either under the form of crystals or an amorphous powder, the solution of which precipitates ferric salts of a deep blood-red.

The following are additional tests to those already noticed:—

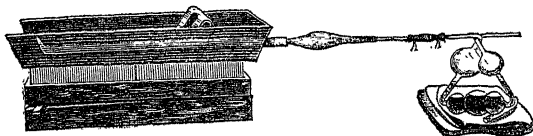

1. From the peculiar odour of opium, often perceptible when the drug has been taken only in very small quantities.

2. A solution containing crude opium is turned of a deep red colour, or, if coloured, it is turned of a reddish-brown, and is darkened, by tincture of ferric chloride.

3. (Hare.) A portion of the suspected liquid is poured into a beaker glass, and a few drops of solution of acetate of lead are added to it; the whole is stirred frequently for 10 or 12

now usually employed instead of charcoal.) The firing is so regulated that the gas enters the potassa apparatus in bubbles easily counted,

without any violence or inconvenience, and it is kept up as long as gas is extricated. As soon as the operation is complete, and the

slightest retrograde action is observed, the charcoal is removed from the combustion tube, and the extreme point of this last is broken off. A little air is then sucked through the apparatus in order to seize on any remaining carbonic-acid gas and moisture. The potash-

apparatus and the chloride of calcium tube are, lastly, detached, and again accurately weighed. The increase in the weight of the first gives the weight of the carbonic acid formed during the combustion; that of the second, the weight of the water.

	Gr.		Gr.
1 gr. of Carbonic acid	= 0.27273	of Carbon	+ 0.72727 of Oxygen.
1 „ Water	= 9.11112	„ Hydrogen	+ 0.88888 „
2 . . . less . . .	0.38385	. . . equal to	1.61615 „

The numbers equivalent to any given number of grains, found as above, are converted into the proportions per cent. by simply dividing them by the weight of the organic substance which has been employed in the experiment, and moving the decimal point of the result two figures to the right.

δ. In applying the preceding method to volatile liquids, it is necessary to enclose them in a small bulb with a narrow neck, instead of mixing them directly with the protoxide of copper. The bulb with its contents is introduced into the combustion tube, and after some 6 or 8 inches of the protoxide is heated to redness, a hot coal is applied near where the bulb is situated, so that the liquid which it contains may be slowly volatilised and passed through the heated mass in the state of vapour, and be thus completely burned.

2. *Estimation of the NITROGEN.*—*a.* Several methods are employed for this purpose, but the only one of general application, and adapted to the non-scientific operator, is that of MM. Varrentrap and Will, described under GUANO. To ensure correct results, the caustic soda must be pure, and the lime of good quality and well burnt. The last, having been properly slaked with a little water holding the former in solution, the mixture is thoroughly dried in an iron vessel, and then heated to full redness in an earthen crucible.* The ignited mass is rubbed to powder in a warm dry mortar, and either used at once or carefully preserved from the air. The best quantity of the organic substance to operate on is, in this case, about 10 grs., which must be dried, and accurately weighed with the usual precautions. Bodies very rich in either nitrogen or hydrogen are best mixed with about an equal weight of pure sugar before triturating them with the soda-lime. MM. Varrentrap and Will weigh the nitrogen under the form of double chloride of

platinum and ammonium, dried at 212° Fahr. This salt contains 6.272% of nitrogen.

δ. M. Péligot has modified the preceding plan by conducting the gaseous matter extricated during the operation into a three-bulb tube charged with a standard solution of sulphuric acid. This he subsequently pours into a beaker-glass, and after tinging it with a single drop of tincture of litmus, he tests it with either a standard aqueous solution of soda or one of lime in sweetened water, after the common method of alkalimetry. The difference between the saturating power of the acid in its normal condition and after its exposure in the condenser indicates the amount of ammonia formed. (See GUANO.) Each grain of ammonia contains .82353 gr. of nitrogen.

Concluding remarks. The successful application of the above processes requires considerable care and some aptitude in manipulating, as well as the employment of a very delicate balance for determining the weights. A greater error in the weighings than the $\frac{1}{100}$ gr. cannot be tolerated when exact results are desired. The method of MM. Varrentrap and Will for the determination of nitrogen answers admirably for all organic compounds containing it, except those in which it exists under the form of hyponitrous, nitrous, and nitric acids; for which, however, it is not required. When extreme accuracy is aimed at, the atmospheric air in the apparatus, and that absorbed during the preliminary operations by the substances employed, must be expelled before the application of heat to the combustion tube.

OR-MOLU'. [Fr.] This name is given to gold-coloured brass or bronze, so finished off as to have the appearance of gold, or of being gilt; but it is often applied in a more general sense. The French more particularly excel in working in or-molu, and the products of this branch of their industry hold an im-

portant position in the art manufactures of France.

To give or-molu its richest appearance, "it is not unfrequently brightened up after 'dipping' (that is cleaning in acid) by means of a scratch-brush (a brush made of very fine brass wire), the action of which helps to produce a very brilliant gold-like surface. It is protected from tarnish by the application of lacquer." (Ure.)

ORMSKIRK MEDICINE. A nostrum supposed to prevent hydrophobia, so named after the residence of its inventor, Mr. Hill, of Ormskirk. It is said to have consisted of the ingredients named below, but nothing certain is known on the subject, as the inventor died without revealing its secret:—Chalk, $\frac{1}{2}$ oz.; Armenian bole, 3 drs.; elecampane root, 1 dr.; alum, 10 grs.; oil of aniseed, 5 or 6 drops; all in fine powder. For a dose, to be taken for 6 successive mornings, in a glass of weak milk-and-water.

ORPIMENT. Native yellow sulphide of arsenic. The finest samples used by artists (golden orpiment) come from Persia. See **ARSENIC** (Tersulphuret).

ORRIS. *Syn.* ORRIS ROOT, FLORENTINE R.; **RADIX IRIDIS, L.** The dried rhizome of *Iris Florentina, pallida, and Germanica*. Sialogogue, irritant, subacid, and errhine. Chiefly employed to impart a violet odour to oils, tooth powder, snuffs, spirits, &c.; and when cut into peas, to keep open issues.

ORSEDEW. Dutch leaf-gold.

ORSELLIC ACID. Two compounds pass under this name—**ALPHA-ORSELLIC ACID** and **BETA-ORSELLIC ACID**. They closely resemble each other, and are obtained in a similar manner; the first from the South American variety of *Rocella tinctoria*, the last from that grown at the Cape.

ORSELLINIC ACID. *Syn.* **LECANORIC ACID.** A compound formed along with picroerythrine, by boiling erythric acid for some time with water. It is also formed by boiling alpha-orsellic acid with water. In both cases, if the ebullition is too long continued, the new acid is wholly or in part converted into orcin.

Prop. &c. Crystallisable; bitter-tasted; soluble in water; its aqueous solution, by exposure to the air, assumes a beautiful purple colour.

ORTHOPÆDIA. In surgery, the straightening, correcting, or curing deformities of children. See **SURGERY**.

OSMAZOME. The substance on which the peculiar odour and flavour of boiled meat and broth were formerly supposed to depend.

Prep. From lean meat, minced, and digested in cold water, with occasional pressure; the filtered infusion is gently evaporated nearly to dryness, and then treated with alcohol; the alcoholic tincture is, lastly, evaporated. The product has a brownish-yellow colour, is soluble in water, and its aqueous solution is precipi-

tated by infusion of galls and the mineral astringent salts.

OSMIUM. Os. A rare metal found associated with the ores of platinum by M. Tennant, in 1803.

OSTEOCOLLA. A rough sort of glue or gelatin obtained from bones by digestion in dilute hydrochloric acid, to remove their earthy matter, and afterwards acting on the residuum with water at a high temperature, until it is wholly dissolved.

OTALGIA. Pain in the ear. See **EARACHE**.

O'THYL. In chemistry, a radicle having the formula C_2H_3O , assumed by Professor Williamson to exist in acetic acid.

OT'TO OF ROSES. See **OILS** (Volatile).

OVALBUMEN. White of egg; to distinguish it from seralbumen, or the albumen of the serum of the blood.

O'VENS. A very ingenious and useful improvement in the apparatus for baking was introduced some years ago by Mr. Selinger, of Carlisle. It consists in causing the articles to be baked to traverse a heated earthenware tube. This tube forms the oven. It is of considerable length, and the biscuits or other articles are slowly traversed through it, from end to end, at such a rate as will allow of the baking being completed during the passage. The biscuits are carried on trays, set on travelling chains; or the trays are made into an endless web or chain. The oven is thus entirely self-acting, and the articles demand no attention whatever from the attendants, whilst the system combines superior economy with the best results. A 'pyrometer,' or heat indicator, is attached externally, so that the attendant can regulate the heat with great facility. The object of these improvements is to reduce the cost of baking, and to improve the appearance of the baked articles. The apparatus is applicable as well to the baking of articles of clay or earthenware as to bread or biscuits.

Of the ovens now in common use by the bakers, that known as the 'hot-water oven' is perhaps the best; not merely in reference to economy, but also with reference to its superior cleanliness, and the ease with which the articles operated on may be turned out of that delicate yellowish-brown tint for which the bread of the Viennese and Parisian bakers is so celebrated. See **BAKING, BREAD, &c.**

OX. The *Bos Taurus* (Linn.), one of the ruminantia. In its more limited sense, the word is restricted to the emasculated animal. The flesh, milk, skin, horns, bones, and blood of this animal are all serviceable to man. Gold-beater's skin is prepared from the peritoneal membrane of its cæcum. Its blood, fat, horns, and excrement were among the simples of the Ph. L. 1618. See **BEEF, GALL, MILK**, and *below*.

Ox-Gall. *Syn.* **OX-BILE; FEL BOVINUM, F. BOVIS, F. TAURI, L.** Crude ox-gall is noticed at page 552. Refined ox-gall

(*Fel bovinum purificatum*) is prepared as under:—

1. Fresh ox-gall is allowed to repose for 12 or 15 hours, after which the clear portion is decanted, and evaporated to the consistence of a thick syrup by the heat of a water bath; it is then spread thinly on a dish, and exposed in a warm situation near the fire, or to a current of dry air, until nearly dry; it is, lastly, put into wide-mouthed bottles or pots, and carefully tied over with bladder. In this state it will keep for years in a cool situation. For use, a little is dissolved in water.

2. Fresh gall, 1 pint; boil, skim, add powdered alum, 1 oz.; boil again till the alum is dissolved, and when sufficiently cool, pour it into a bottle, and loosely cork it down. In a similar manner boil and skim another pint of gall, add to it 1 oz. of common salt, and again boil, cool, and bottle it, as above. In three months decant the clear from both bottles, and mix them in equal quantities; the clear portion must then be separated from the coagulum by subsidence or filtration.

Uses, &c. Both the above are employed by artists to fix chalk and pencil drawings before tinting them, and to remove the greasiness from ivory, tracing paper, &c. The first is also used in medicine.

OXALATE. *Syn.* OXALAS, L. A salt of oxalic acid. The soluble oxalates are easily formed by directly neutralising a solution of oxalic acid with a metallic hydrate, carbonate, or oxide; and the insoluble oxalates, by double decomposition. See OXALIC ACID and the respective bases.

OXALIC ACID. $H_2C_2O_4$. *Syn.* ACIDUM OXALICUM, L. This substance was discovered by Bergman, in 1776. It occurs both in the mineral and organic kingdoms, and is produced artificially by the action of nitric acid on sugar, starch, woody fibre, &c. It abounds in wood-sorrel, in which it exists in combination with a little potassa. With the exception of gum and sugar of milk, all starchy and saccharine substances yield oxalic acid when treated with nitric acid at a somewhat elevated temperature.

Prep. 1. From sugar:—

a. Nitric acid (sp. gr. 1.42), 5 parts, diluted with water, 10 parts, is poured on sugar, 1 part, and the mixture is digested at a gentle heat, as long as gaseous products are evolved; the liquid is then concentrated by evaporation until it deposits crystals on cooling; the crystals, after being drained and freed from superfluous moisture, are redissolved in the smallest possible quantity of boiling water, and the solution is set aside to crystallise. The residuary 'mother-water' is treated with a little fresh nitric acid (say $\frac{1}{2}$ part) at a gentle heat, after which it is evaporated, as before, for a second crop of crystals. This process is repeated until the solution is exhausted. The brownish-coloured crystals thus obtained are allowed to effloresce by exposure to dry air, and are then redissolved and recrystallised.

By repeating this treatment they yield pure colourless oxalic acid at the third crystallisation.

b. (Schlesinger.) Sugar (dried at 257° Fahr.), 4 parts, and nitric acid (sp. gr. 1.38), 33 parts, are digested together, as before, and as soon as the evolution of gas ceases the liquid is boiled down to one sixth of its original volume, and set aside to crystallise. The whole process may be completed in about 2 hours, and in 1 vessel, and yields of beautifully crystallised oxalic acid, at the first crystallisation, a quantity equal to 56 to 60% of the weight of the sugar employed.

c. (Ure.) Nitric acid (sp. gr. 1.4), 4 parts, and sugar, 1 part, are digested together by the heat of a water bath, and as soon as gas ceases to be extricated the vessel is removed from the heat, and set aside to cool and crystallise. The use of a little sulphuric acid along with the nitric acid contributes to increase the product.

2. From POTATO- or DEXTRIN-SUGAR:—(Nyren.) From the washed pulp of potatoes, boiled for some hours with water, q.s., in a leaden vessel, with about 2% of oil of vitriol, until the fecula of the pulp is converted into saccharine matter, shown by the liquid being no longer turned blue by iodine; the whole is then filtered through horse-hair bags or strainers, and the filtrate is evaporated until its density is such that a gallon of it weighs 14 to 14½ lbs.; in this state it is converted into oxalic acid by treatment with nitric acid in the way already described. A similar process was patented some years ago by Messrs. Davy, Macmurdy, and Co.

3. From SAWDUST:—

(Roberts, Dale, & Co., Patent.) This process is the one now usually employed for the manufacture of oxalic acid on the large scale. It is based on Gay-Lussac's discovery, that wood and similar substances are converted into oxalic acid by fusion with caustic alkali. The practical details of the process are thus given by Dr. Murray Thomson, of Edinburgh:—(1) Hydrate of sodium and hydrate of potassium, mixed in the proportion of 2 equivalents of the former to 1 equivalent of the latter, are dissolved, and solution evaporated until of specific gravity 1.35; sawdust is now stirred in until a thick paste results. (2) This paste is then heated on iron plates, during which it is constantly stirred; water is first given off; the mass then swells; inflammable gases, hydrogen and carburetted hydrogen, are evolved, along with a peculiar aromatic odour. When the temperature has been maintained at 400° for one or two hours, this stage of the process is complete; the mass has now a dark colour, and contains only 1 to 4 per cent. of oxalic acid, and about 5 per cent. of formic acid. The bulk, therefore, of the mass at this stage consists of a substance whose nature is not yet known, but which is intermediate between the cellulose and oxalic acid. (3) The next stage

consists in a simple extension of the last, in which the mass is heated till quite dry, care being taken that no charring takes place. It now contains the maximum quantity of oxalic acid, 28 to 30 per cent. (4) This oxalic acid now exists as oxalate of potassium and sodium in the gray powder resulting from stage 3. This powder is now washed on a filter with solution of carbonate of sodium, which seems to have the singular and unexpected power of decomposing the oxalate of potassium, and converting it into oxalate of sodium. At all events, it is quite true that all traces of potassium are washed out with the solution of carbonate of sodium. The only explanation that occurs to account for this unusual decomposition is that oxalate of sodium is a more insoluble salt than oxalate of potassium, and therefore may be formed by preference. (5) This oxalate of sodium is now decomposed by boiling milk of lime. Oxalate of calcium falls as a precipitate, and soda remains in solution. This soda is boiled down, and again made use of with fresh sawdust. This recovery of alkali is also practised with the potassium salt which filters through in the last stage. (6) The oxalate of calcium is now decomposed in leaden vessels with sulphuric acid. Sulphate of calcium is precipitated, and oxalic acid is in solution, which is now evaporated, and the acid separates in crystals, which now need only to be recrystallised to make them quite pure, and fit the acid for all the purposes for which it is employed. *Prod.* By this ingenious process 2 lbs. of sawdust are made to yield 1 lb. of oxalic acid.

Prop., &c. Colourless, transparent, prismatic crystals, possessing a powerfully sour taste and acid reaction; these effloresce in warm dry air, with loss of 28% (2 eq.) of water, and then form a white powder, which may be sublimed in part, without decomposition; the crystals are soluble in 8 parts of water (9 parts, "and form a solution of sp. gr. 1.045," —Ure) at 60° Fahr., in their own weight or less of boiling water, and in about 4 parts of alcohol; with the acids, it forms salts called oxalates.

Tests.—1. Solution of chloride of barium occasions a white precipitate in neutral solutions of oxalic acid (oxalates), which is soluble in both nitric and hydrochloric acid.—2. Solution of nitrate of silver, under like circumstances, gives a white precipitate, which is soluble in nitric acid and in ammonia, and which, when heated to redness, yields pure silver.—3. Lime water and solutions of all the soluble salts of calcium produce white precipitates, even in highly dilute solutions of oxalic acid or of the oxalates, which is freely soluble in both nitric and hydrochloric acid, but is nearly insoluble in either acetic or oxalic acid, and is converted into carbonate of calcium upon ignition.—4. Oxalic acid (or an oxalate), when heated, in the dry state, with oil of vitriol in excess, is converted into

carbonic anhydride and carbonic oxide; the former produces a white precipitate with lime water, and the latter, when kindled, burns with a faint blue flame. Of the above tests, solution of sulphate of calcium (*vide* No. 3) is the most delicate and characteristic.—5. It is distinguished from Epsom salt by its acid reaction, its solubility in rectified spirit, its complete dissipation by heat, and by emitting a slight crackling noise during its solution in water. See MAGNESIA (Sulphate).

Uses, Pois., &c. Oxalic acid is chiefly used in the arts of calico printing and bleaching; to remove ink-spots and iron-moulds from linen, and to clean boot-tops. It is extremely poisonous. The treatment, in cases of its having been swallowed, is to promote vomiting, and to administer chalk, whiting, or magnesia, mixed up with water, in considerable quantities. The use of the alkalies or their carbonates must be avoided, as the compounds which these form with oxalic acid are nearly as poisonous as the acid itself. The remaining treatment is noticed under ACIDS. In poisoning by oxalic acid, the nervous system is almost always affected, and the patients experience numbness, formication of the extremities, and sometimes convulsions, so that the symptoms somewhat approach those produced by strychnia, from which it is distinguished by its corrosive action on the tissues, and its effect upon the heart and circulatory system.

Concluding remarks. The manufacture of oxalic acid is an important one. The process of Roberts, Dale, and Co., has so much cheapened the price of oxalic acid, that in 1851 it sold for 16d. per lb., and now, in 1864, it only costs from 8d. to 9d. per lb. More than half the amount of oxalic acid used all over the world is now made from sawdust. In manufacturing the acid from sugar, on the large scale, the first part of the process is either conducted in salt-glazed stoneware pipkins of the capacity of 3 to 5 quarts each (which are about two thirds filled and set in a water bath), or in wooden troughs lined with lead, and heated by means of a coil of steam-pipe. On the small scale, a glass retort or capsule is commonly employed. The most appropriate temperature appears to be about 125° Fahr. and the best evidence of the satisfactory progress of the decomposition is the free but not violent evolution of gas, without the appearance of dense red fumes, or, at all events, any marked quantity of them. When these are disengaged with violence and rapidity, a greater quantity of the newly formed acid suffers decomposition, and flies off in a gaseous form. The sp. gr. of the nitric acid commonly used on the large scale ranges from 1.22 to 1.27, equivalent quantities being taken. The evaporation is preferably conducted by the heat of steam. The evolved nitrous vapours are usually allowed to escape, but this loss may be in part avoided by conveying them into a chamber filled with cold damp air, and

containing a little water, when they will absorb oxygen, and be recondensed into fuming nitric acid. Various modifications of this plan have been patented. That of Messrs. McDougall and Rawson, which is one of the simplest and best, consists in passing the mixed nitrous fumes through a series of vessels containing water, and connected together by tubes, so that the fumes which collect at the top of one vessel are conveyed to nearly the bottom of the next one, and then, bubbling up through the water, mix with the air, a supply of which is provided for the purpose. The nitrous fumes are thus brought alternately into contact with air and water, and by the time they reach the last vessel are reconverted into nitric acid. Another plan is to pass the mixed nitrous vapours through a vessel stuffed with some porous substance, as pumice-stone or pounded glass, conjointly with a supply of steam from a boiler and a supply of oxygen by a blowing machine.

The products obtained by skilful manipulation are—from good dry sugar, 128%; from good treacle, 107%—"One cwt. of good treacle will yield about 116 lbs. of marketable oxalic acid, and the same weight of good brown sugar may be calculated to produce about 140 lbs. of acid." "As a general rule, 5 cwt. of saltpetre, or an equivalent of nitrate of soda, with 2½ cwt. of sulphuric acid, will generate sufficient nitric acid to decompose 1 cwt. of good sugar, and yield, as above, 140 lbs. of fair marketable oxalic acid, free from superfluous moisture." (Ure.) On the small scale, 5 parts of sugar yield nearly 6 parts of crystallised acid.

Chemically pure oxalic acid is best prepared by precipitating a solution of binoxalate of potassium with a solution of acetate of lead, washing the precipitate with water, decomposing it, whilst still moist, with dilute sulphuric acid or sulphuretted hydrogen, and gently evaporating the filtrate so that crystals may form as it cools.

OXIDA'TION. *Syn.* OXYDATION. The combination of bodies with oxygen, forming oxides; the operation or process adopted to induce or facilitate such conversion.

OX'IDE. *Syn.* OXYD; OXYDUM, L. A compound formed by the union of oxygen with another body.

OX'YCHLO'RIDE. *Syn.* OXICHLORIDE; OXYCHLORIDUM, L. A term often loosely applied to compounds of an oxide and chloride, whether in definite or variable proportions. See ANTIMONY (Oxychloride), &c.

OX'YCRATE. *Syn.* OXYCRATUM, L. The old name of a mixture of vinegar and water, dulcified with honey.

OX'YCRO'CEUM. See PLASTERS.

OXY'GEN. O. *Syn.* OXYGEN GAS, DEPHLOGISTICATED AIR†, EMPYREAL A., VITAL A.†; OXYGENIUM, L. An elementary body discovered by Scheele and Priestley in 1744. It is remarkable that, although this substance

forms a large proportion of our atmosphere (nearly one fourth), and confers upon it the power of supporting respiration and combustion, and also constitutes the principal portion of the water of our rivers and seas (eight ninths), and enters largely into the composition of the majority of the various mineral bodies that form the bulk of our globe, its existence should have remained unsuspected, or at least undetermined, until a comparatively recent date. Oxygen is an essential constituent of all living organisms. It is absorbed by animals during respiration, and evolved in a free state by growing vegetables when exposed to sunlight. The oxygen gas of the atmosphere is mechanically mixed, not chemically combined, with the nitrogen.

Prep. 1. From red oxide of mercury, heated over a spirit lamp or a few pieces of ignited charcoal. The operation is usually performed in a small green-glass retort, or in a short tube of hard Bohemian glass, closed with a perforated cork furnished with a piece of bent glass tube of small bore, to convey the liberated gas to the vessel arranged to receive it. Pure. 1 oz. yields about 100 cubic inches.

2. From chlorate of potassium, as the last. Pure. 100 grs. yield nearly 100 cubic inches (Brande; 115—Ure). This is the plan adopted in the P. Cod. The decomposition occurs with both the above substances at a heat below that of redness.

3. From a mixture of chlorate of potassium (in coarse powder), 3 parts; powdered binoxide of manganese, 1 part; both by volume. Pure. 100 grs. of the mixture yield about 110 cubic inches of oxygen. This method, which has received the approval of Faraday, is exceedingly convenient. The gas is evolved with a rapidity which is entirely at the command of the operator, by simply increasing or lessening the heat. The residuum in the retort may be kept for another operation, if not exhausted; or it may be at once washed out with a little warm water, and the manganese, which is uninjured by the process, reserved for future use. Red lead, black oxide of copper, red oxide of iron, and several other substances, answer nearly as well as binoxide of manganese.

4. From a mixture of bichromate of potassium, 3 parts; oil of vitriol, 4 parts; gently heated, as before. Yields pure oxygen very freely, and with a rapidity entirely at the will of the operator. (Balmain.)

5. From binoxide of manganese and oil of vitriol, equal parts; as the last. 44 grs. of pure binoxide of manganese yield 8 grs., or 24 cubic inches, of oxygen; 1 oz. yields 88 grs., or 256 cubic inches. (Liebig.)

6. (On the large scale.)—a. From nitre exposed to a dull red heat in an iron retort or gun-barrel. 1 lb. yields about 1200 cubic inches of gas, contaminated, more or less, with nitrogen. (Ure.)

b. From binoxide of manganese, as the last. 1 oz. of the pure binoxide yields 44 grs., or 128 cubic inches, of oxygen (Liebig); 1 lb. of good commercial binoxide yields from 1500 to 1600 cubic inches, or from 5 to 6 galls.

c. M. Boussingault has reinvestigated a process, long known, although not usefully applied, by which pure oxygen gas may be obtained from the atmosphere at a trifling cost, so as to enable it to be collected in unlimited quantities and preserved in gasometers, like coal-gas, for application in the arts, manufactures, and sanitation. This process depends upon a peculiar property possessed by the earth baryta, of absorbing atmospheric oxygen at one temperature and evolving it at another; or rather, the ready conversion of hydrate of barium into peroxide of barium by a current of atmospheric air at a dull red heat, and the decomposition of this peroxide, by steam, at a lower temperature, even at 212° Fahr., with reproduction of hydrate of barium, the process being in reality a continuous one. The baryta is mixed with a portion of hydrate of calcium or of magnesium, and the mixture being placed in an appropriate earthen tube heated to dull redness, is oxidised by passing a current of dry atmospheric air over it. As soon as the oxidation is complete, the tube is connected with the gas-holder, and a jet of steam allowed to act upon it; this reconverts the peroxide of barium into hydrate of barium, the excess of oxygen being given off and collected in the gas-holder. The baryta is then again oxidised by a fresh current of air and deoxidised by steam, and the whole process is repeated as frequently as required. One ton of baryta, thus treated, is capable of yielding 2500 cubic feet of pure oxygen every 24 hours; and this, as it does not waste or lose its properties, at the mere cost of the fuel and labour required in the process.

d. From ferrate of potassium, prepared on the large scale. When exposed to moisture or thrown into water, pure oxygen is evolved. This method has been successfully adopted to maintain the air of diving-bells, and of other confined spaces, in a state fit for respiration.

7. OXYGEN GAS AT THE ORDINARY TEMPERATURE. Boettger states that when a mixture is made of equal weights of the peroxides of lead and barium, and dilute HNO_3 of a strength of 9° Beaumé is poured thereon, a current of pure O , free from ozone and antozone, is given off abundantly. This mixture of the two peroxides may be kept dry in a stoppered bottle for any length of time.

Prop. Oxygen gas is colourless, tasteless, inodorous, and incombustible; the sp. gr. is 1.057 (Dumas); 1.1026—Berzelius & Dulong; 1.111—Thomson; 100 cubic inches at 60° Fahr., and 36 inches of the barometer, weigh 34.29 grs. (Dumas); 34.109 grs.—Berz.; 34.6 grs.—Brande; 33.85 grs.—Ure). Its density

to that of atmospheric air is, therefore, as about 11 to 10. It is a powerful supporter of combustion, and its presence is essential to the existence of both animal and vegetable life. It forms $21\frac{1}{2}\%$ (20.81%) by volume, and $23\frac{1}{2}\%$ by weight, of the atmosphere. (M. Dumas.) Water dissolves about 5% by volume of oxygen, and by pressure a much larger quantity, forming oxygenated water (AQUA OXYGENII).

Tests. 1. It is distinguished from other gases by yielding nothing but pure water when mixed with twice its volume of hydrogen and exploded, or when a jet of hydrogen is burnt in it.—2. A recently extinguished taper, with the wick still red-hot, instantly inflames when plunged into this gas.—3. A small spiral piece of iron wire ignited at the point, and suddenly plunged into a jar of oxygen, burns with great brilliancy and rapidity. Charcoal does the same.

Estim. The estimation of the quantity of oxygen in an organic compound has already been described. For determining the quantity present in atmospheric air, and other like gaseous mixtures, Doberainer has proposed the use of pyrogallic acid. The air under examination (freed from moisture) is measured into an accurately graduated tube over mercury, capable of holding about 80 cubic centimetres, and which it should $\frac{2}{3}$ fill. A solution formed of 1 part of dry hydrate of potassium and 2 parts of water, and in volume about $\frac{1}{15}$ th that of the air, is next introduced by means of a pipette with a curved point, and is gently agitated therewith in the gas for a short time; the decrease of volume gives the proportion of carbonic anhydride present. A solution of pyrogallic acid (1 gramme in 5 or 6 centimetres of water), equal in volume to one half that of the solution of potassa already used, is then introduced by means of another pipette, and the mixed liquids are cautiously shaken together over the inner surface of the tube.

When absorption ceases (which it does in a few minutes), the quantity of residual gas (nitrogen) is read off from the graduations; the difference in volume before and after the introduction of the pyrogallic acid indicates the proportion of oxygen. This is a mere modification of Prof. Liebig's method. 1 gramme of pyrogallic acid in combination with hydrate of potassium is capable of absorbing about 188 cubic centimetres of oxygen. (Doberainer.) Other methods employed for the analysis of air, depending on the increase or loss of weight when the air is passed over finely divided copper heated to redness, the loss of volume when the air is exploded in a eudiometer with half its bulk of hydrogen, or when a stick of phosphorus is left in it for some hours, are well known, and described at length in every elementary work on chemical analysis. The last method, although less accurate than the others, has the advantage of extreme simplicity.

Uses. Hitherto the trouble and expense of

preparing oxygen has precluded its direct use on the large scale. It has been employed to increase the illuminative and heating power of lamps, and to render vitiated air respirable, &c.; and when largely diluted with atmospheric air, or condensed in water, as a remedial agent in asphyxia arising from the inhalation of carbonic acid and carbonic oxide.

Concluding remarks. Oxygen gas may be collected in the usual way, either over water, mercury, or in bags; or, on the large scale, in gasometers. The purity of the products of the several processes given above depends on the substances from which the gas is obtained being themselves pure. For particular experiments, the first portion of gas should be allowed to escape, or be received apart, as with this, as with the other gases, it is contaminated with the atmospheric air of the apparatus. The gas procured from manganese or nitre may be purified by passing it through milk of lime or a solution of caustic potassa; it will still, however, retain some traces of nitrogen. See ORGANIC SUBSTANCES, OZONE, &c.

OXYGENATION. *Syn.* OXYGENISEMENT. The act or process of combining with oxygen. It is of more general application than the word 'oxidation,' which is frequently confounded with it, but which is only correctly applied when an oxide is formed.

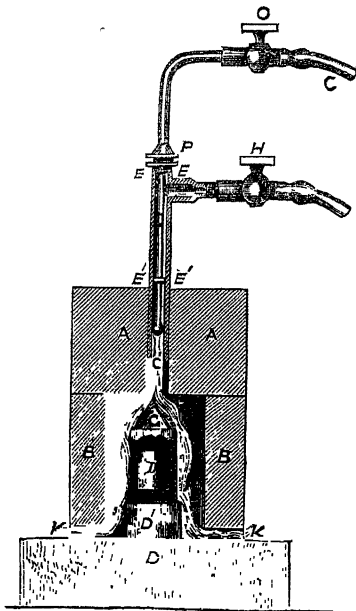

OXYGENISED LARD. *Syn.* OXYGENATED AXUNGIE; AXUNGIA OXYGENATA, L. *Prep.* (Ph. Bat. 1805.) From prepared lard, 16 parts, melted over a slow fire, and then mixed with nitric acid, 1 part; the combination being promoted by constant stirring with a glass rod, until it ceases to affect litmus paper. It should be extremely white, and should be kept in the dark. See OINTMENT OF NITRIC ACID.

OXYHYDROGEN BLOWPIPE. See BLOWPIPE. Deville and Debray ('Ann. Ch. Phys.' [3], lvi, 385) employ the oxyhydrogen blowpipe in the following manner for effecting the fusion of platinum and the refractory metals which accompany it. The apparatus consists of the blowpipe *C* (see below), a furnace *ABD*, and a crucible *GHI*. The blowpipe is composed of a copper tube about half an inch in diameter, terminating below in a slightly conical platinum jet about $1\frac{1}{2}$ inch long. Within this tube, which is supplied with hydrogen or coal gas through the stop-cock *H*, is a second copper tube *C'* for supplying oxygen, terminated also by a platinum nozzle with an aperture of about a twelfth of an inch in diameter.

The furnace *ABD* consists of three pieces of well-burnt lime of slightly hydraulic quality, which may be turned at a lathe with ease. The cylinder *A* is about $2\frac{1}{2}$ inches thick, and is perforated by a slightly conical hole into which the blowpipe fits accurately, passing about half-way through the thickness of the mass. A second somewhat deeper

cylinder of lime, *B*, is hollowed into a chamber wide enough to admit the crucible, and leave an interval of not more than a sixth of an inch clear around it. *KK* are four apertures for the escape of the products of combustion.

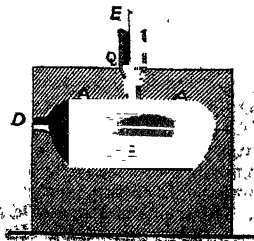

The outer crucible *HH* is also made of lime, but it contains a smaller crucible *I* of gas-coke, provided with a cover of the same material; and in this the substance to be fused is placed, the crucible resting on the lime support *D'*. The conical cover *G* is made

of lime, and its apex should be placed exactly under the blowpipe jet, at a distance from it of $\frac{3}{4}$ to $1\frac{1}{2}$ inch.

The different pieces of the furnace must be bound round with iron wire to support them when they crack. The oxygen is admitted under a pressure of a column of 16 inches of water. The temperature is gradually raised to the maximum, and in about eight minutes from this time the operation is complete.

By employing a jet of mixed coal-gas and oxygen (*EQ*, see below) in a furnace of lime,

Deville and Debray succeeded, at an expense of about 43 cubic feet of oxygen, in melting and refining, in 42 minutes, 25·4 lbs. avoirdupois of platinum, and casting it into an ingot in a mould of gas-coke; and much larger masses have since been melted by this method. Lime is so bad a conductor of heat that if a cup of lime not more than 0·8 inch thick be filled with melted platinum the exterior scarcely rises beyond 300° F. (Miller's 'Elements of Chemistry,' 3rd. ed., pt. ii, p. 825.)

OXYMEL. *Syn.* OXYMEL, L. An acidulous syrup made of honey and vinegar. There are only two oxymels in the last Ph. L. The ingredients in an oxymel should be of such a character, and in such proportions, as to produce a mixture of the proper consistence without evaporation.

Oxymel of Colchicum. *Syn.* OXYMEL COLCHICI CORMI, OXYMEL COLCHICI, L. *Prep.* (Ph. D. 1826.) Fresh corms (roots) of meadow saffron, 1 oz.; distilled vinegar, 1 pint (wine measure); macerate for 2 days, press out the liquor, filter, add of clarified honey, 2 lbs., and boil down the mixture to the consistence of a syrup, frequently stirring.—*Dose.* 1 to 3 drs., twice or thrice a day; in gout, rheumatism, dropsy, &c.

Oxymel of Garlic. *Syn.* OXYMEL ALII, L. *Prep.* (Ph. L. 1746.) Sliced garlic, 1½ oz.; caraway seed and sweet fennel seed, of each, 2 drs.; boiling vinegar, 8 fl. oz.; infuse, strain, and add of clarified honey, 10 oz. In whooping-cough, chronic diarrhoea, rheumatism, &c.

Oxymel, Pectoral. *Syn.* OXYMEL PECTORALE, O. INULÆ COMPOSITUM, L. *Prep.* (Ph. Br.) Elecampane, 1 oz.; orris root, ½ oz.; water, 1½ pint; boil to ½ pint, strain, add of honey, 16 oz.; ammoniacum, 1 oz.; (dissolved in) vinegar, 3 fl. oz.; lastly, boil to an oxymel.—*Dose.* 1 spoonful, occasionally; in coughs, humid asthma, &c.

Oxymel, Simple. *Syn.* VINEGAR SYRUP, ACETATED HONEY; OXYMEL (Ph. L. & D.), OXYMEL SIMPLEX, MEL ACETATUM, L. *Prep.* 1. (Ph. L.) Acetic acid (sp. gr. 1·048), 7 fl. oz.; distilled water, 8 fl. oz.; mix, and add them to honey, 5 lbs., previously made hot. This contains only one half the acid ordered in the Ph. L. 1836.

2. (Ph. D.) Clarified honey, 1 lb.; acetic acid (sp. gr. 1·044), 3 oz.; as before. Stronger than the last.

3. Ph. L. 1836.) Honey, 10 lbs.; acetic acid (1·048), 1½ pint; as before. This contains too much vinegar. (See No. 1.)

4. (Wholesale.) From honey (thick and good), 12 lbs.; melt it by a gentle heat, add of distilled vinegar (of fully 5½), 2 quarts, and strain the mixture through flannel. No evaporation is required.

Uses, &c. Demulcent and refrigerant.—*Dose.* 1 to 4 fl. drs., either gradually sucked from the spoon or dissolved through some simple liquid. Dissolved in water, it forms a useful and

pleasant cooling drink or gargle in fevers, sore throats, hoarseness, &c.; but in some individuals it occasions griping. It is commonly used as an adjunct, in mixtures, &c.

Oxymel of Squills. *Syn.* HONEY OF SQUILLS; MEL SCILLÆ (Ph. L.), O. SCILLITICUM, L. *Prep.* 1. Vinegar of squills, 2½ pints; gently evaporate it to 12 fl. oz., and add of honey (previously made hot), 5 lbs.

2. (Ph. L. 1836.) Strained honey, 3 lbs.; vinegar of squills, 1½ pint; boil to a proper consistence. The formula of the Ph. D. 1826 was similar.

Uses, &c. Expectorant, and in large doses nauseant.—*Dose.* ½ to 2 fl. drs.; in chronic coughs, hoarseness, humeral asthma, &c.

Oxymel of Ver digris. See LINTMENT.

OXYRHODYNE. *Syn.* OXYRHODINON. An old compound formed of 1 part of vinegar of roses and 2 parts of oil of roses.

OXYSACCHARUM. A syrup acidulated with vinegar. See SYRUP.

OXYSULPHIDE. A name given to certain compounds or mixtures of metallic oxides and sulphides. See ANTIMONY, OXYSULPHIDE, &c.

OYSTER. *Syn.* OSTREA, L. This well-known shell-fish is the *Ostrea edulis* (Linn.)

Oysters are nutritious and easy of digestion, when fresh, but are apt to prove laxative to those unaccustomed to their use. They are in season each month of the year the name of which contains the letter R. The best British oysters are found at Purfleet; the worst near Liverpool. Colchester, and other places in Essex, are the great nurseries or feeding-grounds for supplying the metropolis, and, indeed, the whole of England, with the most esteemed variety (NATIVES) of this shell-fish. The shells (TESTÆ PREPARATÆ, T. OSTREARUM) were formerly used in medicine as an absorbent. See SHELL-FISH, SAUCES, &c.

OZONE (Greek, ὄζω, I smell) is a peculiar variety of oxygen, characterised by its greater weight, its peculiar chlorous smell, its intensely active oxidising powers, and, finally, by the ease with which it passes into common oxygen. The history of ozone may be summed up as follows:—In 1785 Van Marum observed the production of a peculiar smell when electric sparks were passed through oxygen. This smell, which every one who has worked with an electric machine must have noticed, Van Marum regarded as the "smell of electricity," thinking that electricity was a substance. In 1840, Schönbein, of Basle, proved the existence of a definite substance, to which he assigned the name of ozone, and discovered several modes of producing it, a delicate test for it, and several of its most striking properties. He subsequently added many new facts, but to the time of his death never held a correct theory in regard to its nature. Later researches by Maignac and Dedalline, Becquerel and Fremy, Andrews and Tait, Serret, Brodie, and others, have established the true nature of this remark-

able body. It is now generally admitted that it only differs from common oxygen in containing three atoms of oxygen in each molecule instead of two. In fact, as the formula for oxygen is O_2 , that of ozone is O_3 . It follows that ozone is half as heavy again as oxygen, and it has accordingly been demonstrated that its specific gravity is 24 ($H=1$), that of oxygen being 16. All the known reactions of ozone are easily explained in accordance with this view.

Ozone may be generated in several ways. (1) By the action of electricity on oxygen or air, sparks are far less efficacious than the silent or "slow" discharge; but the best apparatus is the induction-tube of Siemens. This consists of two tubes, one inside the other. The inner side of the inner and the outer side of the outer tube are coated with tinfoil, and these coatings are connected with the terminals of a powerful induction-coil. Dry air or oxygen streams between the tubes and passes out, strongly charged with ozone. (2) During certain processes of oxidation a piece of phosphorus, half covered with water in a bottle of air, absorbs a portion of the oxygen, while another portion becomes partially ozonised. It has been recently shown that ozone is formed in small quantity during the burning of hydrogen at a jet, and in several analogous reactions. (3) During the liberation of oxygen at low temperatures, when barium dioxide is moistened with sulphuric acid, the odour of ozone is at once apparent, and the evolution proceeds for a considerable time. (4) In the electrolysis of water the oxygen evolved consists partly of ozone, especially if the poles are small.

Ozone has never been isolated. By the use of Siemens' apparatus, oxygen containing, as a maximum, twenty volumes per cent. of ozone may be obtained. This represents a contraction of about 1.11th during formation. But it is at present impossible to separate the one from the other. Ozone is entirely converted into oxygen by a temperature of $270^\circ C$. The conversion is effected more slowly at lower temperatures. Silver, mercury, iodine, and many other substances, are oxidised immediately, at ordinary temperatures, by ozone. One of the most delicate tests for it is potassium iodide, either alone or mixed with starch. *A brown colour in the former case, a blue in the latter, indicates the liberation of iodine. In the best form of *ozonometer* strips of paper saturated with starch and potassium iodide are exposed to the action of a definite volume of air in a dark chamber. The comparative quantities of ozone in different samples of air are judged of by the intensity of the colour compared with a fixed scale on which 1 is the lightest and 10 generally the darkest shade.

Ozone acts as a *reducing* agent in certain curious cases. Thus, hydrogen peroxide and ozone reduce one another, water and oxygen being the sole products; and some substances, such as platinum black and manganese peroxide, convert it into oxygen without suffering

change themselves, being probably oxidised and reduced alternately. Ozone is a powerful bleaching and disinfecting agent, from the ease with which it gives up its third atom of oxygen.

Ozone is frequently present in the atmosphere, formed by atmospheric electricity, and perhaps by other means. Its function in nature is not yet well known; but as it readily converts ammonia into ammonium nitrite, it is probable that nitrites, and so ultimately nitrates, are among its ultimate products.

OZONOMETER. This name has been given to paper prepared with a mixed solution of starch and iodide of potassium. It is white, but is turned blue by ozonised air, when exposed to it in a slightly moistened state.

PACK'FONG. *Syn.* **PAKFONG, CHINESE WHITE COPPER.** An alloy formed by fusing together, in a covered crucible, arsenic, 2 parts, and copper clippings, $4\frac{1}{2}$ to 5 parts, arranged in alternate layers, and covered with a capping of common salt. The product contains about 10% of arsenic.

Prop., &c. White, slightly ductile, and permanent at ordinary temperatures; at a temperature below that of redness it suffers decomposition, with the extrication of fumes of arsenious acid. Formerly much used for the scales of thermometers and other instruments, dial plates, candlesticks, &c. It is now almost superseded by the alloy of nickel and copper called German silver, to which the name is also applied by some recent writers.

PACK'ING. As there is considerable art in packing brittle, hollow-ware, as glass, china, &c., in such a way that it will stand exposure to the jolting, blows, and agitation of land carriage, it is better, when it is of much value, or in quantity, to employ a person qualified for the job. A man, accustomed to packing such articles, may be readily procured at any glass-works, or china warehouse, for a trifling consideration. When this cannot be done, it must be recollected that the great secret of safe packing consists in the articles being carefully preserved from undue pressure or contact with each other, yet so firmly arranged, and so surrounded with some material, as hay, straw, sawdust, &c., that they cannot be shaken into such a condition by the ordinary contingencies of transport. Loose packing must always be avoided.

PAD'DING. Amongst calico printers this term is applied to the operation of impregnating the pores of their cloth with a mordant. It is now almost exclusively performed by means of a simple piece of machinery (padding machine), which essentially consists of—a 'large reel,' around which the unprepared cloth is wound—a 'guide roller,' over which it passes to smooth and adjust it before entering the liquor—a copper cylinder or 'dip-roller,' nearly at the bottom of the mordant-trough,

under which it is carried from the guide-roller—a half-round polished 'stretched-bar,' to give it equal tension—a pair of 'padded cylinders,' to remove superfluous moisture—and, lastly, a 'reel' to receive the mordanted ('padded') cloth. The degree of tension is regulated by a weight suspended on a lever, and motion is given to the whole by an endless band from the driving shaft. This machine is also applicable to many of the operations of dyeing, bleaching, and starching textile fabrics.

PAINTER'S CREAM. *Prep.* Take of pale nut oil, 6 oz.; mastic, 1 oz.; dissolve, add of sugar of lead, $\frac{1}{4}$ oz.; previously ground in the least possible quantity of oil; then further add of water, q. s., gradually, until it acquires the consistence of cream, working it well all the time. *Used* by painters to cover their work when they are obliged to leave it for some time. It may be washed off with a sponge and water.

PAINTING. The art or employment of laying on colour. In the fine arts, the production of a picture or a resemblance in colours on a flat surface. The artistic and mechanical consideration of this subject does not come within the province of our volume; but notices of the leading materials employed by both artists and house painters are given under the respective names. See the various pigments, COLOURS, OILS, VARNISHES, &c., and *below*.

Painting, Distem'per. A method of painting generally adopted by the ancients. Water was the principal medium, but various gelatinous and albuminous 'binders' were added to fix the pigments. Of these the most important were glue, size, and white of egg. In modern distemper, as executed by the painters of theatrical scenery, panoramas, &c., spirit of turpentine is largely employed as a medium.

Painting, Elydor'ic. A method of painting invented by M. Vincent, of Montpellier, having for its object to combine the fresh appearance and finish of water colours with the mellowness of oil painting. The liquid employed as a vehicle for the pigments is an emulsion formed of oil and water by the intervention of certain portion of gum or mucilage.

Painting, Enam'el. In this variety of painting, vitrifiable colours are laid on thin plates of metal, and fused into it. The outline is first burnt in, after which the parts are filled up gradually, with repeated fusions at an enameller's lamp, to the most minute finishing touches. "The enamel painter has to work, not with actual colours, but with mixtures which he only knows from experience will produce certain colours after the operation of the fire." (Aikin.)

Painting, Encaustic. This method is very ancient, but is now seldom practised. According to Pliny, the colours were made up into crayons with wax, and the subject being traced on the ground with a metal point, they

were melted on the picture as they were used. A coating of melted wax was then evenly spread over all, and when it had become quite cold was finally polished.

The art of encaustic painting, after lying dormant for about 15 centuries, was revived by Count Caylus, in 1753. In its new form, the wood or canvas to be painted on is first well rubbed over with wax, and then held before the fire, so that the wax may penetrate and fill up all the interstices, and form a perfectly even surface. The coloured pigments are next mixed with the powder noticed below, which is then rubbed smooth with some thick gum water, and applied with brushes in the same manner as ordinary water colours. When the painting is finished, and quite dry, it is brushed over with pure white wax in a melted state, the surface being equalised by the skilful application of heat; it is, lastly, polished off, as before.

The powder.—To white wax, melted in an earthen pipkin, add, in small portions at a time, an equal weight of powdered mastic, stirring continuously until the whole is incorporated; then pour it into cold water, and afterwards reduce it to powder in a wedgwood-ware mortar. A small quantity only of this powder is used with light colours; but more is required with the darker ones, until, on approaching black, the two may be mixed in almost equal proportions.

Painting, Fres'co. This method of painting was known to the ancient Egyptians, and was commonly practised by the Greeks and Romans. It is confined to the decoration of the walls of buildings, and is executed by incorporating the colours with the still moist plaster, or *gesso*. The pigments employed are entirely mineral or vitreous. As it is extremely difficult to alter the work after the colours are once absorbed, or after the ground has hardened, the whole must be carefully designed before commencing the picture, and no more commenced at once than can be executed during the day.

Of all the varieties of painting, fresco is "undoubtedly the most virile, most sure, most resolute, and most durable" (Vasari), and the one most adapted for the purposes of historical painting in its grandest and most exalted forms. In comparison with it, it has been said that even oil painting is "employment fit only for women and children." (Michael Angelo.)

Painting, Glass. See STAINED GLASS.

Painting, Oil. This well-known and much practised method of painting takes its name from the vehicle employed for the colours. The last may be any of those of a permanent character, and whose natural tint is not altered by admixture with oil. Linseed, nut, and poppy oil, are those which are principally employed. The first requires the addition of 'driers,' and hence is generally used under the form of 'boiled oil.' Spirit of turpentine is

commonly used to thin down the prepared colours, and the finished picture is frequently covered with a coat of varnish.

Painting, Por'celain. See POTTERY, STAINED GLASS, &c.

Painting, Vel'vet. Any of the ordinary non-corrosive pigments or liquid colours, thickened with a little gum, may be employed in this art; preference being, however, given to those that possess the greatest brilliancy, and which dry without spreading. See STAINS, &c.

Painting, Water-colour. In its strictest and modern sense, 'water-colour painting' means the painting on paper with colours diluted with water. The English school of water-colour painting has produced works which bear comparison with the great masterpieces in oil, and even surpass them in the delicacy of atmospheric effects. The old practice of making the entire drawing in light and shade by washes of Indian ink or neutral tints, and then adding the various local colours in transparent washes, has given place to the more healthy system of painting every object in its appropriate local colour at the outset.

PAINTINGS. Many valuable paintings suffer premature decay from the attacks of a microscopic insect, a species of acarus or mite. The best method of preventing this variety of decay, is to add a little creasote (dissolved in brandy or vinegar), or a few grains each of corrosive sublimate and sal ammoniac (dissolved in a little water), to the paste and glue used to line the picture, as well as to add a few drops of pure creasote or of an alcoholic or ethereal solution of corrosive sublimate to the varnish, when any is to be applied. If the destruction alluded to has already commenced, the painting should be at once carefully cleaned and re-lined, observing to employ one or other of the remedies just mentioned.

The most appropriate and only safe situation in which to keep paintings, is where there is a pure and moderately dry atmosphere. Impure air abounds in carbonic acid and sulphuretted hydrogen. It is the presence of the last in the air that blackens the 'lights,' and causes most of the 'middle tints' and 'shades' to fade; and it is exposure to damp that produces mouldiness and decay of the canvas. For this reason valuable paintings should not be kept in churches, nor suspended against heavy walls of masonry, especially in badly ventilated buildings. Excess of light, particularly the direct rays of the sun, also acts injuriously on paintings, since it bleaches some colours and darkens others.

The blackened lights of old pictures may be instantly restored to their original hue by touching them with peroxide of hydrogen, diluted with 6 or 8 times its weight of pure water. The part must be afterwards washed with a clean sponge and water. The most astonishing results have been produced in this

way. See PEROXIDE OF HYDROGEN (pag 610).

PAINTS. In trade, this term is commonly applied to pigments ground with oil to a thick paste, ready to be 'thinned down' with oil or turpentine to a consistence adapted for application with a brush.

Paints are prepared on the small scale by grinding the dry pigments with the oil by means of a stone-and-muller; on the large scale they are ground in a colour mill. There are several pigments, as King's yellow, Scheele's green, verdigris, white lead, &c., which from their poisonous character cannot be safely ground by hand, except in very small quantities at a time, and then only by the exercise of extreme caution.

In mixing or thinning down paints for use, it may be useful to mention that—for outdoor work, boiled oil is principally or wholly employed, unless it be for the decorative parts of houses, when a portion of turpentine and pale linseed oil is often added.—For in-door work, linseed oil, turpentine, and a little 'driers,' are generally used in the same way. The smaller the proportion of oil employed for the purpose, the less will be the gloss, and the greater the ultimate hardness of the coating. For 'flatted white,' &c., the colour being ground in oil, requires scarcely any further addition of that article, as the object is to have it 'dead' or dull. The best driers are ground litharge, and ground sugar of lead; the first for dark and middle tints, and the last for light ones.

To preserve mixed paints in pots from 'skinning over' or drying up, they should be kept constantly covered with water; or, what is better, with a thin film of linseed oil.

Brushes, when out of use, may be preserved in a similar manner to mixed paints. When dirty, or required for a paint of another colour, they may be cleaned with a little oil of turpentine, which may be either preserved for the same purpose another time, or may be allowed to deposit its colour, and then used to thin down paints as usual. In no case, however, should it be thrown back into the cistern or pan with the pure 'turps.'

Paints, Flexible. *Prep.* Take of good yellow soap (cut into slices), 2½ lbs.; boiling water, 1½ gall.; dissolve, and grind the solution whilst hot with good oil paint, 1½ cwt. *Used* to paint canvas.

Paints, Vitri'fiable. See ENAMEL, GLAZE, STAINED GLASS, &c.

PALLADIUM. Pd. A rare metal discovered by Dr. Wollaston in the ore of platinum, in 1803.

Prep. 1. A solution of the ore of platinum in *aqua regia*, from which most of the metal has been precipitated by chloride of ammonium, is neutralised by carbonate of sodium, and then treated with a solution of cyanide of mercury; the white insoluble precipitate (cyanide of palladium) is next washed, dried, and heated to redness; the residuum of the

ignition (spongy palladium) is then submitted to a gradually increased pressure, and welding at a white heat, so as to form a button, in a similar manner to that adopted with platinum. *Prod.* Columbian ore of platinum, 1½; Uralian do., .25 to .75g.

2. The native alloy of gold and palladium (from the Brazils) is submitted to the operations of quartation and parting, the nitric acid employed being of the density of 1.3; the silver is next precipitated from the solution by means of a solution of common salt or dilute hydrochloric acid, and the decanted supernatant liquid, after evaporation to one half, is neutralised with ammonia, and concentrated so that crystals may form; these (chloride of palladium and ammonium) are cautiously washed in a little very cold water, dried, mixed with borax, and exposed in a crucible to the strongest heat of a powerful blast furnace, when a solid button of pure palladium is formed.

Prop., &c. Palladium closely resembles platinum in appearance, fusibility, malleability, and ductility; but it is less dense, and has a rather more silvery colour than that metal; it is freely soluble in aqua regia, and is slowly attacked by nitric acid, but the other acids exert little or no action on it; heated to redness in the air, a very superficial blue or purple film of oxide forms on the surface, which is again reduced at a white heat. It melts at 156° Wedgwood. Sp. gr. 11.3 to 12.1 (11.8—Wollaston; 12.14—Vauquelin). It readily unites with copper, silver, and some other metals, by fusion.

Tests. 1. The neutral solutions of palladium are precipitated in the metallic state by ferrous sulphate, dark brown by sulphuretted hydrogen, olive by ferrocyanide of potassium, and yellowish-white by cyanide of mercury.—2. A drop of tincture of iodine placed on the surface of metallic palladium, and then evaporated by the heat of a spirit lamp, leaves a black spot. By the last two tests palladium is readily distinguished from platinum.

Uses. It has been employed to form the scales of mathematical and astronomical instruments, and is used in dentistry. Its alloy with silver is a very valuable white metal. It is also used for making the smaller divisions of grain and gramme weights. Palladium is not tarnished by sulphuretted hydrogen. An alloy of 1 part of palladium and 100 parts of steel is well adapted for cutting instruments which require to be perfectly smooth on the edge.

PALMITIC ACID. $\text{HC}_{16}\text{H}_{31}\text{O}_2$. Prepared from palmitin (*see* next article), by saponification, as stearic acid is prepared from stearin. It forms pearly scales, and melts at 140° Fahr., like margaric acid, which it closely resembles.

PALMITIN. *Syn.* TRIPALMITIN. $\text{C}_{48}\text{H}_{98}\text{O}_6$. The solid portion of palm oil, purified by crystallisation from hot ether.

White; soluble in ether and slightly so in hot alcohol; melts at 118° Fahr.; by saponification, it is converted into palmitic acid. (*See above.*)

PALPITATION. *Syn.* PALPUS, PALPITATIO CORDIS, L. A violent and irregular beating or action of the heart, either temporary or occasional. When it does not arise from sudden or violent agitation or distress of mind; it may be regarded as a symptom of a disturbance of the nervous functions by disease, in which case attention should be directed to the removal of the primary affection.

PAL'SY. *See* PARALYSIS.

PANACEA. A term formerly applied to those remedies which were supposed to be capable of curing all diseases, and still applied to some quack medicines.

PANA'DA. *See* BREAD JELLY.

PAN'ARY FERMENTATION. The vinous fermentation as developed in the dough of bread.

PAN'CAKES. These are essentially fried batter, variously enriched and flavoured, according to the taste of the cook. When they contain fruit, fish, meat, or poultry, or are highly seasoned or ornamented, they are commonly called FRITTERS.

Prep. (M. Soyer.) Break 2 to 4 eggs into a basin, add 4 small table-spoonfuls of flour, 2 teaspoonfuls of sugar, and a little salt; beat the whole well together, adding, by degrees, ½ pint of milk, or a little more or less, depending on the size of the eggs and the quality of the flour, so as to form a rather thick batter; next add a little ginger, cinnamon, or any other flavour at will; lastly, put them into the pan, and when set, and one side brownish, lay hold of the frying-pan at the extremity of the handle, give it a sudden but slight jerk upwards, and the cake will turn over on the other side; when this is brown, dish up with sifted sugar, and serve with lemon. *See* FRITTERS.

PANIFICA'TION. The changes which occur in flour-dough under the influence of the fermentative process and heat, by which it is converted into bread.

PAPA'VERINE. *Syn.* PAPAVERINA. An alkaloid discovered by Merck in opium. It crystallises in needles; is insoluble in water; is slightly soluble in cold alcohol, and in ether; and forms crystallisable salts with the acids which possess little solubility. The hydrochlorate, one of the most characteristic of these compounds, crystallises in beautiful colourless prisms, which possess a high refractive power, and are only very slightly soluble in dilute hydrochloric acid.

PAP'ER. *Syn.* CHARTA, PAPIRUS, L.; PAPIER, Fr. The limits of this work preclude the introduction of a description of the manufacture of this well-known and most useful article, which is now almost exclusively made by machinery of an elaborate and most ingenious description. We must, therefore, content ourselves with a short notice of a few of

the preparations of the manufactured article. (See *below*.)

Good white paper should be perfectly devoid of odour, and when burnt it should leave a mere nominal amount of ash; digested in hot water, the liquid should be neutral to test paper, and not affected by sulphuretted hydrogen or the alkaline sulphurets, or by tincture of iodine. Coloured papers should not contain any deleterious matter.

Paper, Blistering. See VESICANTS.

Paper, Cloth. This is prepared by covering gauze, calico, canvas, &c., with a surface of paper pulp in a 'Foudrinier machine,' and then finishing the compound sheet in a nearly similar manner to that adopted for ordinary paper.

Paper, Coloured. For those papers which are merely coloured on one side, the pigments, ground up with gum water or size, or the stains thickened with a little of the same, are applied with a brush, after which the sheets are suspended on a line to dry.

For paper coloured throughout its substance, the tinctorial matter is usually mixed with the pulp in the process of manufacture; or the manufactured paper is dipped into a bath of the colouring substance, and then hung up to dry.

Paper, Copying. *Prep.* Make a stiff ointment with butter or lard and black lead or lamp black, and smear it thinly and evenly over soft writing paper, by means of a piece of flannel; the next day wipe off the superfluous portion with a piece of soft rag.

Use, &c. Placed on white paper and written on with a style or solid pen, a copy of the writing is left on the former. By repeating the arrangement, 2, 3, or more copies of a letter may be obtained at once. This paper, set up in a case, forms the ordinary 'manifold writer' of the stationers. The copying or transfer paper used for obtaining fac-similes of letters written with 'copying ink,' is merely a superior quality of bank-post paper.

Paper, Em'ery. See EMBERY.

Paper, Glass. *Prep.* From powdered glass, as emery paper. *Used* to polish wood, &c. See GLASS (Powdered).

Paper, Gout. *Syn.* CHCETA ANTI-ARTHRITICA, L.; PAPIER FAXARD, Fr. *Prep.* 1. Euphorbium, 1 part; cantharides, 2 parts; (both in powder;) rectified spirit, 8 parts; ether, 3 parts; digest in a stoppered bottle, with frequent agitation, for a week; to the strained tincture add of Venice-turpentine, 1 part; lastly, dip thin white paper into it, and dry the sheets in the air.

2. (Mohr.) Euphorbium, 1 dr.; cantharides, 4 drs.; rectified spirit (strongest), 5 oz.; make a tincture, to which add of Venice turpentine, 1½ oz., previously liquefied with resin, 2 oz.; and spread the mixture, whilst warm, very thinly on paper. *Used* as a counter-irritant in gout, rheumatism, &c.

Paper, Hydrograph'ic. An absurd name given to paper which may be written on with

simple water or with some colourless liquid having the appearance of water.

Prep. 1. A mixture of nut-galls, 4 parts, and calcined sulphate of iron, 1 part (both perfectly dry and reduced to very fine powder), is rubbed over the surface of the paper, and is then forced into its pores by powerful pressure, after which the loose portion is brushed off. Writes black with a pen dipped in water.

2. From ferric sulphate and ferrocyanide of potassium, as the last. Writes blue with water.

3. As the last, but using sulphate of copper instead of sulphate of iron. Writes reddish-brown with water.

4. The paper is wetted with a colourless solution of ferrocyanide of potassium, and after being dried is written on with a colourless solution of ferric sulphate. Writes blue.

Obs. The above applications, we need scarcely say, are more amusing than useful. See SYMPATHETIC INK.

Paper, Incombustible. See INCOMBUSTIBLE FABRICS.

Paper, Iridescent. *Prep.* (Beasley.) Sal ammoniac and sulphate of indigo, of each, 1 part; sulphate of iron, 5 parts; nut-galls, 8 parts; gum arabic, ¼th part; boil them in water, and expose the paper washed with the liquid to (the fumes of) ammonia.

Paper, Issue. *Syn.* CHARTA AD FONTICULOS, L. *Prep.* (Soubeiran.) Elemi, spermaceti, and Venice turpentine, of each, 1 part; white wax, 2 parts; melt them together by a gentle heat, and spread the mixture on paper. *Used* to keep issues open.

Paper, Lithograph'ic. *Prep.* 1. Starch, 6 oz.; gum arabic, 2 oz.; alum, 1 oz.; make a strong solution of each separately, in hot water, mix, strain through gauze, and apply it whilst still warm to one side of leaves of paper, with a clean painting-brush or sponge; a second and a third coat must be given as the preceding one becomes dry; the paper must be, lastly, pressed, to make it smooth.

2. Give the paper 3 coats of thin size, 1 coat of good white starch, and 1 coat of a solution of gamboge in water; the whole to be applied cold, with a sponge, and each coat to be allowed to dry before the other is applied. The solutions should be freshly made.

Use, &c. Lithographic paper is written on with lithographic ink. The writing is transferred by simply moistening the back of the paper, placing it evenly on the stone, and then applying pressure. A reversed copy is obtained, which, when printed from, yields corrected copies, resembling the original writing or drawing. In this way the necessity of executing the writing or drawing in a reversed direction is obviated. See LITHOGRAPHY, INK, &c.

Paper, Oiled. *Prep.* Brush sheets of paper over with 'boiled oil,' and suspend them on a line till dry. **Waterproof.** Extensively employed as a cheap substitute for bladder and

gut skin, to tie over pots and jars, and to wrap up paste blacking, ground white lead, &c.

Paper, Parchment. *Syn.* PAPERIN, VEGETABLE PARCHMENT. *Prep.* 1. (Poumarède and Figuier.) Dip white unsized paper for half a minute in strong sulphuric acid, sp. gr. 1.842, and afterwards in water containing a little ammonia.

2. (W. E. Gaine, Patent 1857.) Plunge unsized paper for a few seconds into sulphuric acid diluted with half to a quarter its bulk of water (this solution being of the same temperature as the air), and afterwards wash with weak ammonia. This process, now extensively worked by Messrs. De la Rue and Co., produces a much better material than does that of Poumarède and Figuier.

Paper, A tough substance, resembling animal skin. A tough substance, resembling animal skin, and applicable to the same purposes. It is largely used for covering pots of pipes, and preserves, and by the chemist for the covering membrane in experiments in diffusion. See DIALYSER, DIALYSIS, &c.

Paper, Ra'zor. Smooth unsized paper, one of the surfaces of which, whilst in a slightly damp state, has been rubbed over with a mixture of calcined peroxide of iron and emery, both in impalpable powder. It is cut up into pieces (about 5 × 3 inches), and sold in packets. Used to wipe the razor on, which thus does not require stropping.

Paper, Razor-strop. From emery and quartz (both in impalpable powder), and paper pulp (both in the dry state), equal parts, made into sheets of the thickness of drawing paper, by the ordinary process. For use, a piece is pasted on the strop and moistened with a little oil.

Paper, Res'in. *Syn.* POOR-MAN'S PLASTER; CHARTA RESINOSA, L. *Prep.* 1. Bees' wax, 1 oz.; tar and resin, of each, 3 oz.; melted together and spread on paper.

2. (Ph. Bor.) Paper, thinly spread over with black pitch. Calefacient, stimulant, and counter-irritant; in rheumatism, chest affections, &c.

Paper, Rheumatism. See GOUT and RESIN PAPERS.

Paper, Safe'ty. *Syn.* PAPIER DE SURETÉ, Fr. White paper pulp mixed with an equal quantity of pulp tinged with any stain easily affected by chlorine, acids, alkalies, &c., and made into sheets as usual.

Paper, Test. *Syn.* CHARTA EXPLORATORIA, L. Under this head may be conveniently included all the varieties of prepared paper employed in testing. For this purpose sheets of unsized paper or of good ordinary writing paper (preferably the first), are uniformly wetted with a solution of the tinctorial substance in distilled water, and are then hung up to dry in a current of pure air; they are, lastly, cut into pieces of a convenient size, and preserved in closed bottles or jars. For use, a small strip of the prepared paper is either dipped into

or moistened with the liquid under examination, or it is moistened with distilled water, and then exposed to the fumes. A single drop, or even less, of any liquid may be thus tested.

The following are the principal test papers and their applications:—

PAPER, BRAZIL-WOOD. From the decoction. Alkalies turn it purple or violet; strong acids, red.

PAPER, BUCKTHORN. From the juice of the berries. Reddened by acids.

PAPER, CHERRY-JUICE. As the last.

PAPER, DAHLIA, GEORGINA P. From an infusion of the petals of the violet dahlia (*Georgina purpurea*). Alkalies turn it green; acids, red; strong caustic alkalies turn it yellow. Very delicate.

PAPER, ELDERBERRY. From the juice of the berries. As the last.

PAPER, INDIGO. From a solution of indigo. Decoloured by chlorine.

PAPER, IODIDE OF POTASSIUM.—a. From the solution in distilled water. Turned blue by an acidulated solution of starch.

b. From a mixture of a solution of iodide of potassium and starch paste. Turned blue by chlorine, ozone, and the mineral acids, and by air containing them.

PAPER, LEAD. From a solution of either acetate or diacetate of lead. Sulphuretted hydrogen and hydrosulphuret of ammonia turn it black.

PAPER, LITMUS. In general, this is prepared from infusion of litmus, without any precaution, but the following plan may be adopted when a superior test paper is desired:—

a. (Blue.) Triturate commercial litmus, 1 oz., in a wedgwood-ware mortar, with boiling water, 3 or 4 fl. oz.; put the mixture into a flask, and add more boiling water until the liquid measures fully $\frac{1}{2}$ pint; agitate the mixture frequently until it is cold, then filter it, and divide the filtrate into two equal portions; stir one of these with a glass rod previously dipped into very dilute sulphuric acid, and repeat the operation until the litmus infusion begins to look very slightly red, then add the other half of the filtrate, and the two being mixed together, dip strips of unsized paper into the liquid, in the usual manner, and dry them. Acids turn it red; alkalies, blue. The neutral salts of most of the heavy metals also reddens this, as well as the other blue test papers that are affected by acids.

b. (Red.) The treatment of the whole quantity of the infusion (see above) with the rod dipped in dilute sulphuric acid is repeated until the fluid begins to look distinctly red, when the paper is dipped into it as before. The alkalies and alkaline earths, and their sulphides, restore its blue colour; the alkaline carbonates, and the soluble borates also possess the same property. Very sensitive. An extemporaneous red litmus paper may be prepared by holding a strip of the blue variety over a pot or jar.

cessary), roll the mass out, and cut it into squares or lozenges.

Paste, Flour. *Syn.* COLLE DE PÂTE, Fr. From wheat flour. Paper-hangers, shoemakers, &c., usually add to the flour $\frac{1}{2}$ to $\frac{1}{4}$ of its weight of finely powdered resin. It is then sometimes called 'hard paste.' The addition of a few drops of creasote or oil of cloves, or a little powdered camphor, colocynth, or corrosive sublimate (especially the first two and the last), will prevent insects from attacking it, and preserve it in covered vessels for years. Should it get too hard, it may be softened with water. See CEMENTS.

Paste, Fruit. *Prep.* 1. To each pint of the strained juice add of gum arabic, 1 oz., gently evaporate to the consistence of a syrup, and add an equal weight of bruised white sugar; as soon as the whole is united, pour it out on an oiled slab, and, when cold enough, cut it into pieces.

2. Citric acid, $\frac{3}{4}$ oz.; gum arabic, 6 oz.; white sugar, $\frac{3}{4}$ lb.; water, q. s.; dissolve, and flavour with any of the fruit essences. It may be coloured with any of the stains used for confectionery or liquors.

3. As fruit lozenges (see page 721).

Paste, Fur'niture. See POLISH.

Paste, Glove. See GANTEINE.

Paste of Gum Arabic. *Syn.* PASTA GUMMI, L.; PÂTE DE GOMME, P. DE G. ARABIQUE, Fr. *Prep.* 1. As marsh-mallow paste, omitting the mallow roots.

2. Gum arabic (picked), 1 lb.; water, 1 pint; dissolve, add of white sugar, 1 lb.; evaporate by a gentle heat to a very thick syrup, then add the whites of 3 eggs, previously beaten up with orange-flower water, 1 fl. oz., and strained through muslin, and continue the heat with constant stirring, until of a proper consistence on being cooled. The last two are commonly sold for marsh-mallow paste (pâte de guimauve).

3. (Transparent.) From gum arabic (picked), 1 lb.; cold water, 1 pint; white sugar, 1 $\frac{1}{2}$ lb.; proceed as the last, adding orange-flower water, 1 fl. oz., towards the end. Often sold under the name of 'white jujubes.'

Paste of Gum Senegal. *Syn.* PÂTE DE GOMME SENEGAL, Fr. As jujube paste, without the fruit.

Paste, Honey. See ALMOND PASTE.

Paste, Jujube. *Syn.* JUJUBES, JUJUBELONGES; PASTA JUJUBÆ, L.; PÂTE DE JUJUBES, Fr. *Prep.* (P. Cod.) Jujubes (the fruit), 1 lb.; water, 4 lbs.; boil $\frac{1}{2}$ hour, strain with expression, settle, decant the clear portion, and clarify it with white of egg; add a strained solution of gum arabic, 6 lbs., in water, 8 lbs., and to the mixture add of white sugar, 5 lbs.; gently evaporate, at first constantly stirring, and afterwards without stirring, to the consistence of a soft extract, then add of orange-flower water, 6 fl. oz., and place the pan in a vessel of boiling water. In 12 hours carefully remove the scum, pour the matter into

slightly oiled tin moulds, and finish the evaporation (hardening) in a stove heated to 104° Fahr. It is commonly coloured with beet-root, cochineal, or saffron. Expectoant; in coughs, &c. Paste of gum arabic is usually sold for it.

Paste, Li'chen. *Syn.* PASTA LICHENIS, L.; PÂTE DE LICHEN, Fr. *Prep.* (P. Cod.) Iceland moss, 1 lb.; water, q. s.; heat them to nearly the boiling-point, strain with pressure, reject the liquor, and boil the moss in fresh water, q. s., for 1 hour; strain, press, add of gum arabic, 5 lbs.; white sugar, 4 lbs., and evaporate to a proper consistence, as above. Pectoral. With the addition of $\frac{1}{2}$ gr. of extract of opium to each oz., it forms the opiated lichen paste. (P. Cod.)

Paste, Liquorice. *Syn.* LIQUORICE JUJUBES, PASTA GLYCYRRHIZÆ, L.; PÂTE DE RÉGLISSE, P. DE R. NOIRE, Fr. *Prep.* 1 (P. Cod.) Refined juice and white sugar, of each 1 lb.; gum arabic, 2 lbs.; water, 3 quarts; dissolve, strain, evaporate considerably, and, of finely powdered orris root, $\frac{1}{2}$ oz.; oil of aniseed or essence of cedrat, a few drops, and pour the paste upon an oiled slab, or into moulds, as before.

2. (Brown; PASTA G. FUSCA; PÂTE DE R. BRUNE.) Refined juice, 4 oz.; white sugar, 2 lbs.; gum arabic, 3 lbs.; water, 4 pints; proceed as last.

3. (Opiated; PÂTE DE R. OPIACE.—P. Cod.) To the last add of extract of opium, 15 grs.

4. (White; PÂTE DE RÉGLISSE BLANCHE.) As No. 2, substituting the powder of the decorticated root for the extract. All the above are pectoral; the second is also slightly anodyne. They are useful in tickling coughs, hoarseness, &c.

Paste, Marsh-mallow. *Syn.* PASTA ALTHÆÆ, L.; PÂTE DE GUIMAUVE, Fr. *Prep.* (P. Cod. 1816.) Decorticated marsh-mallow root (French), 4 oz.; water, $\frac{1}{2}$ gall.; macerate for 12 hours, strain, add white sugar and gum arabic, of each, 2 $\frac{1}{2}$ lbs.; dissolve, strain, evaporate without boiling to the thickness of honey, constantly stirring, and add, gradually, the whites of 12 eggs, well-beaten with orange-flower water, 4 fl. oz., and strained; continue the evaporation and constant stirring until the mass is so firm as not to adhere to the fingers, then proceed as before.

Obs. It should be very white, light, and spongy. In the P. Codex of 1839 the marsh-mallow root is omitted, and the name is changed to that of 'pâte de gomme,' a compound long sold for it in the shops. Both are agreeable pectorals. See PASTE OF GUM ARABIC.

Paste, Odontalgic. *Syn.* PASTA OPONTALGICA, L. *Prep.* 1. Pellitory (in powder), $\frac{1}{2}$ dr.; hydrochlorate of morphia, 3 grs.; triturate, add of honey, 2 drs.; and oil of cloves, 6 drops.

2. Powdered mastic, pellitory, and white

sugar, of each, 1 dr.; chloroform, q. s. to form a paste. It must be kept in a stoppered bottle. See TOOTHACHE, and below.

Paste, Or'ange. *Prep.* From orange flowers, 2 lbs.; bitter and sweet almonds, of each, blanchéd, 2½ lbs.; beaten to a perfectly smooth paste. An agreeable cosmetic. See ALMOND PASTE.

Paste, Or'geat. *Prep.* From blanchéd Jordan almonds, 1 lb.; blanchéd bitter a. and white sugar or honey, of each, ¼ lb.; beaten to a paste, with orange-flower water, q. s. (or neroli, a few drops), and put into pots. As a cosmetic or to make orgeat milk. For use, rub 1 oz. with ½ pint of water, and strain through muslin.

Paste, Pec'toral. *Syn.* PASTA PECTORALIS, *L.* *Prep.* 1. (PÂTE PECTORALE DE BAUDRY.) Take of gum arabic and white sugar, of each, 7 lb.; water, q. s.; dissolve, add of extract of liquorice, 3 oz.; evaporate, add of extract of lettuce, 2 drs.; balsam of tolu, 1½ oz.; orange-flower water, 4½ fl. oz.; white of 4 eggs; oil of citrons, 5 or 6 drops.

2. (PÂTE PECTORALE BALSAMIQUE DE REGNAULT.) From the flowers of coltsfoot, cudweed, mallow, and red poppy, of each, 1 oz.; water, 1 quart; boil, strain; add, of gum arabic, 30 oz.; white sugar, 20 oz.; dissolve, concentrate, add of tincture of tolu, 3 fl. dr., and pour the mixture on an oiled slab.

3. (ANISATED COLTSFOOT PASTE; PÂTE DE TUSSILAGE À L'ANIS.) From strong decoction of coltsfoot flowers, 1 quart; Spanish juice, ½ lb.; dissolve, strain, evaporate as before, and towards the end add of oil of aniseed, 1 dr. All the above are useful in hoarseness, coughs, &c.

Paste, Pho'sphor. See RATS.

Paste, Pol'ishing. *Prep.* 1. (For copper and brass.) See BRASS PASTE (see page 252).

2. (For iron and steel.) From emery (in fine powder) and lard, equal parts.

3. (For pewter.) From powdered Bath brick, 2 parts; soft soap, 1 part; water, q. s. to make a paste. Used with a little water, and afterwards well rinsed off.

4. (For furniture.) See POLISH.

Paste, Ra'zor. *Prep.* 1. From jeweller's rouge, plumbago, and suet, equal parts, melted together and stirred until cold.

2. From prepared putty powder (levigated oxide of tin), 3 parts; lard, 2 parts; crocus martis, 1 part; triturated together.

3. Prepared putty powder, 1 oz.; powdered oxalic acid, ¼ oz.; powdered gum, 20 grs.; make a stiff paste with water, q. s., and evenly and thinly spread it over the strop, the other side of which should be covered with any of the common greasy mixtures. With very little friction this paste gives a fine edge to the razor, and its action is still further increased by slightly moistening it or even breathing on it. Immediately after its use,

the razor should receive a few turns on the other side of the strop.

4. Diamond dust, jeweller's rouge, and plumbago, of each, 1 part; suet, 2 parts. Powdered quartz is generally substituted for diamond dust, but is much less effective.

5. (Mechi's.) Emery (reduced to an impalpable powder), 4 parts; deer suet, 1 part; well mixed together.

6. (Pradier's.) From powdered Turkey stone, 4 oz.; jeweller's rouge and prepared putty power, of each, 1 oz.; hard suet, 2 oz.

Obs. The above (generally made up into square cakes) are rubbed over the razor strop, and the surface being smoothed off with the flat part of a knife or a phial bottle, the strop is set aside for a few hours to harden before being used.

Paste, Regnault's. See PECTORAL PASTE.

Paste, Rubefa'cient. *Syn.* PASTA RUBEFACIENS, *L.* *Prep.* (Clarus.) From acetate of lead, 1 oz.; bisulphate of potassa, 3 oz.; water, q. s. It acts powerfully and quickly on the skin.

Paste, Rust's. *Prep.* From powdered opium and extract of henbane, of each, 10 grs.; powdered pellitory and extract of belladonna, of each, 20 grs.; oil of cloves, 10 drops. In toothache.

Paste, Sha'ving. *Prep.* 1. Naples soap (genuine), 4 oz.; powdered Castile soap, 2 oz.; honey, 1 oz.; essence of ambergris and oils of cassia and nutmegs, of each, 5 or 6 drops.

2. White wax, spermaceti, and almond oil, of each, ½ oz.; melt, and, whilst warm, beat in 2 squares of Windsor soap previously reduced to a paste with a little rose water.

3. White soft soap, 4 oz.; spermaceti and salad oil, of each, ½ oz.; melt them together, and stir until nearly cold. It may be scented at will. When properly prepared, these pastes produce a good lather with either hot or cold water, which does not dry on the face. The proper method of using them is to smear a minute quantity over the beard, and then to apply the wetted shaving-brush, and not to pour water on them, as is the common practice.

Paste, Swediaur. See CHILBLAIN.

Paste, Tooth. *Syn.* PASTA DENTIFRICIA, ELÆCTUARIUM DENTIFRICUM, *L.* Various preparations are known under this name. They consist, for the most part, of the ordinary substances used as dentifrices, reduced to the state of a very fine powder, and mixed with sufficient honey, sugar, or capillaire, to give them the required consistence. Honey of roses is often used for this purpose, with some agreeable perfume at will. A little eau de Cologne or rectified spirit is a useful addition. The following are a few examples:—

1. (CARBON PASTE; OPÏAT CARBONIQUE.) The chippings of Turkey stone, cylinder charcoal, and prepared chalk, of each, 2 oz.; cochineal and cloves, of each, 1 dr.; honey, 5

sifted through lawn. The fusion must be carefully conducted and continuous, and the melted mass should be allowed to cool very slowly, after having been left in the fire from 24 to 30 hours, at the least. Hessian crucibles are preferred for this purpose, and the heat of an ordinary pottery or porcelain kiln is sufficient in most cases; but a small wind-furnace, devoted exclusively to the purpose, is, in general, more convenient. It is found that the more tranquil, continuous, and uniform the fusion, the denser and clearer is the paste, and the greater its refractive power and beauty.

All the coloured vitreous compounds noticed under GLASS may be worked up as ornamental stones, in the same way as those just referred to.

The following method of obtaining artificial rubies and emeralds, first pointed out by Boettger, is exceedingly simple and inexpensive, and deserves the serious attention of those interested in this ingenious art:—Recently precipitated and well-washed hydrate of aluminum is moistened with a few drops of neutral chromate of potassium, and kneaded so that the mass assumes a tinge scarcely perceptible; it is then rolled up into small sticks, about the thickness of a finger, and slowly dried, taking the precaution to fill the fissures (if any) that form during desiccation with fresh hydrate of aluminum. When perfectly dry, and after having been submitted to a gentle heat, one end of these sticks is brought into the termination of the flame of an oxy-hydrogen blowpipe, until a portion of the mass is fused into a small globule. After the lapse of a few minutes, several minute balls form, having a diameter of some millimètres, and of such intense hardness that quartz, glass, tofazz, and granite, may be easily and perceptibly scratched with them. These, when cut and polished, appear, however, slightly opaque. By employing nitrate of nickel in lieu of chromate of potassium, green-coloured globules, closely resembling the emerald, are obtained.

By the substitution of oxide of chromium for chromate of potassium, Mr. Cooley produced factitious gems of considerable hardness and beauty, though slightly opaque in some portion of the mass. The addition of a very little silica prevented, in a great measure, this tendency to opacity.

It may be observed that the beauty of pastes of factitious gems, and especially the brilliancy of mock diamonds, is greatly dependent upon the cutting, setting up, and the skilful arrangement of the foil or tinsel behind them. See ENAMEL, FOILS, GEMS, GLASS, &c.

PASTELS. [Fr.] Coloured crayons.

PASTIL. *Syn.* PASTILLE; PASTILLUS, PASTILLUM, L. A lozenge or confection. The pastilles (PASTILLI) of French pharmacy, are merely 'confectionery drops' aromatised or medicated. The name is also given to mixtures or odorous substances made up into

small cones and burnt as incense. (See below).

Pastils, Explo'sive. Fumigating pastilles, containing a little gunpowder. Used to produce diversion, but they often prove far from harmless.

Pastils, Fumig'ing. *Syn.* AROMATIC PASTILLES, INCENSE P.; PASTILLI FUMANTES, P. ODORATI, L. *Prep.* 1. Benzoin, 4 oz.; cascarilla, $\frac{1}{2}$ oz.; nitre and gum arabic, of each, 3 drs.; myrrh, 1 dr.; oils of nutmeg and cloves, of each, 25 drops; charcoal, 7 oz.; all in fine powder; beat them to a smooth ductile mass with cold water, q. s.; form it into small cones with a tripod base, and dry them in the air.

2. (Henry and Guibourt.) Powdered gum benzoin, 16 parts; balsam of tolu and powdered sandal wood, of each, 4 parts; a light charcoal (Linden), 43 parts; powdered tragacanth and true labdanum, of each, 1 part; powdered nitre and gum arabic, of each, 2 parts; cinnamon water, 12 parts; as above.

3. (P. Cod.) Benzoin, 2 oz.; balsam of tolu and yellow sandal wood, of each, 4 drs.; nitre, 2 drs.; labdanum, 1 dr.; charcoal, 6 oz.; mix with a solution of gum tragacanth, and divide the mass into pastilles, as before.

4. (PASTILLES À LA FLEUR D'ORANGE.) For powdered roses in the next formula substitute pure orange powder, and for the essence of roses use pure neroli.

5. (PASTILLES À LA ROSE.) Gum benzoin, oilbalm (in tears), and styrax (in tears), of each, 12 oz.; nitre, 9 oz.; charcoal, 4 lbs.; powder of pale roses, 1 lb.; essence of roses, 1 oz.; mix with 2 oz. of gum tragacanth, dissolved in rose water, 1 quart.

6. (PASTILLES À LA VANILLE.) Gum benzoin, styrax, and oilbalm (as last), of each, 12 oz.; nitre, 10 oz.; cloves, 8 oz.; powdered vanilla, 1 lb.; charcoal, $4\frac{1}{2}$ lbs.; oil of cloves, $\frac{1}{2}$ oz.; essence of vanilla, 7 or 8 fl. oz.; as before.

Obs. The products of the above formula are all of excellent quality. They may be varied to please the fancy of the artiste, by the addition or substitution of other perfumes or aromatics. Cheaper pastilles may be made by simply increasing the quantity of the charcoal and saltpetre. The whole of the ingredients should be reduced to fine powder before mixing them. The use of musk and civet, so often ordered in pastilles, should be avoided, as they yield a disagreeable odour when burned. The addition of a little camphor renders them more suitable for a sick chamber. The simplest and most convenient way of forming the mass into cones is by pressing it into a mould of lead or porcelain.

Pastilles are burned either to diffuse a pleasant odour, or to cover a disagreeable one. For this purpose they are kindled at the apex, and set on an inverted saucer or a penny-piece to burn. Persons who use them fre-

quently employ a small china or porcelain toy ('pastille house') sold for the purpose.

Pastils, Mouth. *Syn.* BREATH PILLS, CACHOU LOZENGES; PASTILLI COSMETICI, L.; CACHOU AROMATISÉ, C. AROMATIQUE, C. DE BOLOGNA, GRAINS DE CACHOU, Fr. *Prep.* 1. Soft extract of liquorice, 3 oz.; gum catechu and white sugar, of each, 1 oz.; gum tragacanth (powdered), $\frac{1}{2}$ oz.; oil of cloves, 1 dr.; oil of cassia, $\frac{1}{2}$ dr.; essence of ambergris and oil of nutmeg, of each, 12 drops; make a firm mass with rose or orange-flower water, q. s., and divide it into one-grain pills; when these are dry, cover them with gold or silver leaf.

2. Solazzi juice (dried by a gentle heat and powdered), 4 oz.; lump sugar, 3 oz.; powdered catechu, 2 oz.; powdered tragacanth, 1 oz.; oil of cloves, 2 fl. drs.; oil of cassia, 1 fl. dr.; white of egg or rose water, q. s. to form a pill-mass; as before.

3. Powdered catechu, 1 oz.; Salazzi juice, 4 oz.; lump sugar, 12 oz.; oils of cloves, cassia, and peppermint, of each, 1 fl. dr.; mucilage of tragacanth, q. s. to mix; as before.

4. Extract of liquorice (soft), 2 oz.; white sugar, 3 oz.; powdered tragacanth and cascarilla (or orris root), of each, $\frac{1}{2}$ oz.; oil of cloves, $\frac{1}{2}$ fl. dr.; oil of cassia, 12 drops; water, q. s. as before.

5. (Chevallier.) Powdered coffee, chocolate and sugar, of each, $1\frac{1}{2}$ oz.; powdered vanilla, and freshly burnt charcoal, of each, 1 oz.; mucilage of tragacanth, q. s.

6. Chloride of lime (dry and good), 1 dr.; white sugar, 3 oz.; powdered tragacanth, 1 oz.; oil of cloves, 30 drops; rose water, q. s. To disinfect the breath.

Obs. Almost every maker employs his own forms for these articles. The objects to be aimed at are the possession of rather powerful and persistent odour, and a toughness to prevent their too rapid solution in the mouth. The original Italian formula included liquorice, mastic, cascarilla, charcoal, orris root, oil of peppermint, and the tinctures of ambergris and musk, but is now seldom employed in this country. The flavour of peppermint does not, indeed, appear to be approved of by English smokers. Sometimes, instead of being made perfectly spherical, they are flattened a little.

CACHOU À L'AMBRE GRIS, CACHOU À LA CANNELLE, CACHOU À LA FLEURS D'ORANGE, CACHOU MUSQUÉ, CACHOU À LA ROSE, CACHOU À LA VANILLE, CACHOU À LA VIOLETTE, &c., are merely flavoured and scented respectively with the essences or oils of ambergris, cinnamon, neroli, musk, rose, vanilla, violets, &c. See BREATH, CACHOU AROMATISÉ, LOZENGES, PILLS, &c.

PASTRY. Articles of food made of 'paste' or dough, or of which 'paste' forms a principal and characteristic ingredient. The word is popularly restricted to those which contain puff paste, or such as form the staple production of the modern pastrycook; but it is, in reality, of much more general signification.

Several varieties of paste are prepared for different purposes, of which the following are the principal:—

PUFF PASTE. The production of a first class puff paste is commonly regarded as a matter of considerable difficulty, but by the exercise of the proper precautions it is, on the contrary, an extremely simple affair. This paste, before being placed in the oven, consists of alternate laminae of butter or fat and ordinary flour dough, the latter being, of course, the thicker of the two. During the process of baking, the elastic vapour disengaged, being in part restrained from flying off by the buttered surfaces of the dough, diffuses itself between these laminae, and causes the mass to swell up, and to form an assemblage of thin membranes or flakes, each of which is more or less separated from the other. Individually, these flakes resemble those of an ordinary rich unleavened dough when baked; but, collectively, they form a very light crust, possessing an extremely inviting appearance and an agreeable flavour.

The precautions above referred to are—the use of perfectly dry flour, and its conversion into dough with a light hand, avoiding unnecessarily working it,—the use of butter free from water or buttermilk, and which has been reduced to precisely the same degree of plasticity as the dough between which it is to be rolled,—conducting the operation in a cool apartment, and, after the second or third folding of the dough, exposing it to a rather low temperature before proceeding further with the process; and, lastly,—baking the paste in a moderately smart but not too hot an oven. The following are examples:—

1. (Rich.) Take of flour, 1 lb.; butter, $\frac{1}{4}$ lb.; cold spring water, q. s.; make a moderately soft flexible dough, then roll in (as described above) of dry fresh butter, $\frac{1}{4}$ lb.

2. (Ordinary.) Take of flour, 1 lb.; cold water, q. s.; make a dough, and roll in, as before, of butter, 6 oz.

3. (Rundell.) Take $\frac{1}{4}$ peck of flour, rub into it 1 lb. of butter, and make a 'light paste' with cold water, just stiff enough to work well; next lay it out about as thick as a crown-piece; put a layer of butter all over it, sprinkle on a little flour, double it up, and roll it out again; by repeating this with fresh layers of butter three or four times, or oftener, a very light paste will be formed. Bake it in a moderately quick oven.

4. (Soyer.) Put 1 lb. of flour upon your pastry slab, make a hole in the centre, into which put a teaspoonful of salt, mix it with cold water into a softish flexible paste with the right hand, dry it off a little with flour until you have well cleared the paste from the slab, but do not work it more than you can possibly help; let it remain for 2 or 3 minutes upon the slab, then take 1 lb. of fresh butter from which you have squeezed all the buttermilk in a cloth, and brought to the same con-

sistency as the paste, upon which place it; press it out flat with the hand, then fold over the edges of the paste so as to hide the butter, and reduce it with the rolling-pin to the thickness of about $\frac{1}{2}$ an inch, when it will be about two feet in length; fold over one third, over which again pass the rolling-pin; then fold over the other third, thus forming a square; place it with the ends top and bottom before you, shaking a little flour both under and over, and repeat the rolls and turns twice again as before; flour a 'baking-sheet,' upon which lay it, on ice, if handy, or otherwise, in some cool place, for about half an hour; then roll it twice more, turning it as before, and again place it upon ice or in the cold for $\frac{1}{4}$ an hour; next give it two more rolls, making seven in all, and it is ready for use. "You must continually add enough flour while rolling to prevent your paste sticking to the slab."

HALF-PUFF PASTE. As the preceding, using only one half the quantity of butter, and giving the paste only 3 or 4 folds.

SHORT PASTE, SHORT CRUST.—1. Flour (dry and warm), 1 lb.; sugar, 3 oz.; butter, $\frac{1}{2}$ lb.; 2 eggs; water, $\frac{1}{2}$ pint; make a light dough. If one half of 'Jones's patent flour,' be used, no eggs will be required.

2. (Soyer.) Put on the 'paste slab' or 'pie board' 1 lb. of flour, 2 oz. of pounded sugar, 6 oz. of butter, 1 egg, $\frac{1}{2}$ teaspoonful of salt, and $\frac{1}{2}$ pint of water; mix the sugar and butter well together, add them with the water by degrees to the flour; and form a paste, but firmer than puff paste.

PIE PASTE. That commonly used is 'short paste,' varied at will; but at good tables the upper crust of the pie is generally made of 'puff-paste,' and the remainder of 'short paste.'

PUDDING PASTE. This, for baked puddings, may resemble the last. For boiled puddings (or indeed for any), the paste may be either ordinary 'short paste,' or one made with 2 to 6 oz. of butter or lard, or 3 to 8 oz. of chopped beef suet, to each lb. of flour, with or without an egg, and a little sugar, according to the means of the parties. The first is most appropriate for those containing fresh fruit, and that with suet for meat puddings, and those containing dried fruit, as grocer's currants, plums, &c. Milk or milk-and-water is often used instead of simple water to make the dough. Ginger, spices, savory herbs, &c., are common additions to the crusts of puddings. Where economy is an object, and especially among the lower classes, kitchen fat is frequently substituted for suet, and lard for butter. When 'Jones's patent flour' is employed, an excellent plain pudding paste may be made by simply mixing it up with very cold water, and immediately putting it into the water, which should be boiling, and kept in that state until the pudding is dressed.

PATENT MEDICINES. *Syn. MEDICAMENTA ARCANIA, L.* The majority of the pre-

parations noticed under this head are the nostrums popularly termed 'quack medicines,' and which are sold with a Government stamp attached to them. A few other secret or proprietary remedies are also, for convenience, included in the list. An alphabetical arrangement, based on the names of the reputed inventors or proprietors of the articles, has been adopted, as being the one best suited for easy reference. The composition of a number of them is given from careful personal inspection and analysis (by Mr. Cooley), and that of the remainder on the authority of Gray, Griffiths, Paris, Redwood, the members of the Philadelphia College of Pharmacy, and other respectable writers. A variety of articles not included in the following list are noticed along with other preparations of the class to which they belong, or under the names of their proprietors. See BALSAM, CERATE, DROPS, ESSENCE, TINCTURE, OINTMENT, PILLS, &c.

Abernethy's Pills. See **ABERNETHY MEDICINES** (page 4).

Albinole's Ointment. See **HOLLOWAY'S OINTMENT** (*below*).

Ali Ahmed's Treasures of the Desert. There are three preparations included under this name:—

a. (**ANTISEPTIC MALAGMA.**) From lead plaster, 3 parts; gum thus and salad oil, of each, 2 parts; bees' wax, 1 part; melted together by a gentle heat, and spread upon calico.

b. (**PECTORAL, ANTIPHTHISIS, or COUGH PILLS.**) From myrrh, $3\frac{1}{2}$ lbs.; squills and ipecacuanha, of each, 1 lb.; (all in powder;) white soft soap, 10 oz.; oil of aniseed, $1\frac{1}{4}$ oz.; treacle, q. s. to form a pill mass.

c. (**SPHAIROPEPTIC or ANTIBILIOUS PILLS.**) From aloes, 28 lbs.; colocynth pulp, 12 lbs.; rhubarb, 7 lbs.; myrrh and scammony, of each, $3\frac{1}{2}$ lbs.; ipecacuanha, 3 lbs.; cardamom seeds, 2 lbs.; (all in powder;) soft soap, 9 lbs.; oil of juniper, 7 fl. oz.; treacle, q. s. This, as well as the last, is divided into $3\frac{1}{2}$ -gr. pills, which are then covered with tin foil or silver leaf. An excellent aperient pill, no doubt, and one likely to prove useful in all those cases in which the administration of a mild diaphoretic and stomachic purge is indicated. Unlike many of the advertised nostrums of the day, there is nothing in their composition that can, by any possibility, prove injurious; but beyond this they are destitute of virtue.

Anderson's Scot's Pills. See **PILLS**.

Atkinson's Infant Preservative. From carbonate of magnesia, 6 drs.; white sugar, 2 oz.; oil of aniseed, 20 drops; spirit of sal volatile, $2\frac{1}{2}$ drs.; laudanum, 1 dr.; syrup of saffron, 1 oz.; caraway water to make up 1 pint.

Balm of Rackasiri. See **BALSAM** (page 262).

Balsam of Life. *Syn. BAUME DE VIE, Fr.* Several compound medicines of this name are noticed on page 261. The following are well-known nostrums:—

1. (Hoffman's)—a. Of the oils of cinnamon, cloves, lemon, lavender, and nutmegs, and bal-

sum of Peru, of each, 2 drs.; essence of ambergris, oil of amber, and oil of rue, of each, 1 dr.; cochineal, 12 grs.; strongest rectified spirit, 3½ pints; mix.

6. (Ph. Dan. 1840.) Oils of cinnamon, cloves, lavender, and nutmegs, of each, 20 grs.; purified oil of amber, 10 drops; balsam of Peru, 30 grs.; rectified spirit (tinged with alkanet root), 10 oz.

2. (Gabius's.) Nearly similar to Hoffmann's.

3. (Turlington's.) Benzoin and liquid styrax, of each, 12 oz.; balsam of tolu and extract of liquorice, of each, 4 oz.; balsam of Peru, 2 oz.; aloes, myrrh, and angelica root, of each, 1 oz.; highly rectified spirit of wine, 7 pints; digest, with frequent agitation for 10 days, and filter. Externally, the above are rubefacient and corroborant; internally, stimulant, cordial, and pectoral.

Betton's British Oil. From oil of turpentine, 1 pint; Barbadoes tar, ½ lb.; oil of rosemary, 1 fl. oz.

Blake's Green-mountain Ointment. We are told that the active ingredient in this compound is *Arnica montana*, with a basis of soap cerate. It is very useful as an external application in several affections. The chief objection to its use is that it is a secret preparation.

Blake's Toothache Essence. From alum, in fine powder, 1 dr.; sweet spirit of nitre, 5 dr.

Boerhaave's Odontalgic Essence. From opium, ½ dr.; oil of cloves, 2 dr.; powdered camphor, 5 dr.; rectified spirit, 1½ fl. oz.

Bouchardat's Tasteless Aperient. From phosphate of soda, ¾ oz., placed in a soda-water bottle, which is then filled up with carbonated water, at the bottling machine. For a dose.

Brande's Tooth Tincture. From pellitory of Spain (bruised), 1 oz.; camphor, ¾ oz.; opium, ¼ oz.; oil of cloves, 1 dr.; digested for 10 days in rectified spirit, ½ pint.

Brodum's Nervous Cordial. *Prep.* 1. "Originally it consisted simply of an infusion of gentian root in English gin, coloured and flavoured with a little red lavender (compound spirit of lavender). After a time the doctor added a little bark to the nostrum, and subsequently made other additions." ('Anat. of Quackery.')

2. (Paris.) Tinctures of gentian, calumba, cardamoms, and cinchona, compound spirits of lavender, and steel wine, of each, equal parts. "It is tonic, stomachic, and stimulant; but, beyond these, possesses no curative properties." ('Anat. of Quackery.')

Chlorodyne. This nostrum, which was first introduced as "a combination of perchloric acid with a new alkaloid," has become a popular anodyne and sedative. Several preparations are sold under this name, and the claims of the rival makers have occasioned some expensive lawsuits. The name was undoubtedly invented by Dr. J. Collis Browne, but Mr. Freeman, pharmaceutical chemist, claims

to be the inventor of the preparation. Whether Browne's and Freeman's 'chlorodynes' are essentially the same, we are not able to determine, but we know that there is not the slightest foundation for the statements made by each manufacturer respecting the new vegetable principle contained in his medicine. Chlorodyne, in every one of its forms, is simply a mixture of certain well-known materials, some of which are rather dangerous ingredients for a popular nostrum. According to the analysis of Dr. Ogden, Browne's chlorodyne is composed as follows:—

Chloroform, 6 drs.; chloric ether, 1 dr.; tincture of capsicum, ½ dr.; oil of peppermint, 2 drops; hydrochlorate of morphine, 8 grs.; Scheele's hydrocyanic acid, 12 drops; perchloric acid, 20 drops; tincture of Indian hemp, 1 dr.; treacle, 1 dr. 'Towle's chlorodyne' is prepared according to this formula, the ingredients being named on the label.

Clarke's Conglutinum. (See page 362.)

Cochrane's Cough Remedy. Acidulated syrup of poppies.

Corn Nostrums. (See page 371.)

Cottrean's Odontalgic Essence. A nearly saturated ethereal solution of camphor, mixed with about $\frac{1}{10}$ th of its volume of strong liquor of ammonia.

Curtis's Anti-venereal Lotion. A mixture of Beaufoy's solution of chloride of lime, 2 fl. oz., with cold soft water, 8 fl. oz. For use, 1 to 2 table-spoonfuls are put into a wine-glassful of water.

Dalby's Carminative. 1. (Dr. Paris.) Carbonate of magnesia, 40 grs.; tincture of castor and compound tincture of cardamoms, of each, 30 drops; tincture of asafetida and spirit of pennyroyal, of each, 15 drops; laudanum, 5 drops; oil of aniseed, 3 drops; oil of nutmeg, 2 drops; oil of peppermint, 1 drop; peppermint water, 2 fl. oz.—*Dose.* ½ to 1 teaspoonful. The bottle should be well shaken before pouring it out.

2. (Wholesale.) Carbonate of magnesia, 1 oz.; tincture of castor, 5 fl. dr.; tincture of asafetida, 3 fl. drs.; oils of aniseed and pennyroyal, of each, ¼ fl. dr.; oil of nutmeg, 15 drops; syrup of poppies, 7 oz.; rectified spirit, 3½ fl. oz.; peppermint water, ½ pint; as before.

Davidson's Cancer Remedy. A mixture of arsenious acid and hemlock, both in powder. (Dr. Paris.)

Davis's Calorific. The 'LIQUID' is commercial acetic acid (sp. gr. 1.048), diluted with about an equal volume of water, and coloured with burnt sugar or spirit colouring. The 'SHIELD' consists of a piece of red flannel backed with oil skin, to prevent evaporation. A few drops of calorific are sprinkled on the flannel, which is then bound over the affected part. The heat of the body gradually volatilises the acetic acid, and the escape of the vapour being prevented by the oil skin, a strongly counter-irritant action is set up.

Derbyshire's Embrocation. From opium and mottled soap, of each, 2 oz.; extract of henbane, 2 drs.; and mace, $\frac{1}{2}$ dr.; boiled for 30 minutes in water, 3 pints; to the cold liquor, rectified spirit, 1 quart, and liquor of ammonia, 1 fl. oz., are added, and, after repose, the clear portion is decanted. A preventive of sea-sickness.

Deshler's Cerate. Yellow basilicon. (See page 417.)

Duncan's Gout Medicine. See GOUT.

Dutch Ague Remedy. A mixture formed of Peruvian bark and cream of tartar, of each, 1 oz.; cloves, $\frac{1}{2}$ dr.; reduced to fine powder. — *Dose.* 1 $\frac{1}{2}$ dr., every 3 hours. (Dr. Paris.)

Godfrey's Cordial. 1. (Original formula.) Opium (sliced), $\frac{1}{2}$ oz.; sassafras chips, 1 oz.; English brandy, 1 quart; macerate for 4 or 5 days, then add, of water, 1 quart, treacle, 3 $\frac{1}{2}$ lbs., and simmer the whole gently for a few minutes; the next day decant the clear portion.

2. (Dr. Paris.) Aniseed, caraways, and corianders, of each, bruised, 1 oz.; sassafras chips, 9 oz.; water, 6 pints; simmer gently until reduced to 4 pints, then add of treacle, 6 lbs.; and when nearly cold, further add of tincture of opium, 3 fl. oz.

3. (Phil. Col. of Phar.) Carbonate of potassa, 2 $\frac{1}{2}$ oz.; water, 26 pints (old wine measure); dissolve, add of sugar-house molasses (treacle), 16 pints (o. w. m.); simmer the mixture, remove the scum, and when it has considerably cooled, add, of tincture of opium, 24 fl. oz.; oil of sassafras, $\frac{1}{2}$ fl. oz.; (dissolved in) rectified spirit, 1 quart (o. w. m.). * It contains about 16 drops of laudanum (= 1 $\frac{1}{2}$ gr. of opium) in each fl. oz.

The following forms are also current in the wholesale trade:—

4. From molasses, 16 lbs.; distilled water, 2 $\frac{1}{2}$ galls.; oil of sassafras, 1 fl. oz., (dissolved in) rectified spirit, $\frac{1}{2}$ gall.; bruised ginger, $\frac{1}{2}$ oz.; cloves, $\frac{1}{2}$ oz.; laudanum, 8 fl. oz.; macerate for 14 days, and strain through flannel.

5. Sassafras chips, 1 lb.; ginger (bruised), 4 oz.; water, 8 galls.; simmer until reduced to 2 galls.; then add, of treacle, 16 lbs.; rectified spirit, 7 lbs.; laudanum, 1 pint.

6. Opium, $\frac{1}{2}$ oz.; treacle, 7 lbs.; boiling water, 1 gall.; dissolve, and add, of rectified spirit, 1 quart; oil of sassafras, $\frac{1}{2}$ dr.; cloves and mustard seed, of each, $\frac{1}{2}$ oz.; coriander and caraway seeds, of each, 1 dr.; digest for a week.

7. Caraways, corianders, and aniseed, of each, 1 lb.; water, 6 galls.; distil 5 galls., and add, of treacle, 28 lbs.; laudanum, 1 quart; and oil of sassafras, 1 fl. oz., previously dissolved in rectified spirit, 1 gal.

Obs. This preparation is anodyne and narcotic, and, amongst the lower classes, is commonly given to children troubled with wind or colic. Its frequent and excessive use has sent many infants prematurely to the grave. Gray says, "It is chiefly used to prevent the

crying of children in pain or starving." The dose is $\frac{1}{2}$ teaspoonful and upwards, according to the age and susceptibility of the child.

Graves' Gout Preventive. A tincture prepared by steeping, for a week, dried orange peel and hiera picra, of each, 1 oz., and rhu-barb, $\frac{1}{2}$ oz., in brandy, 1 pint.

Griurod's Remedy for Spasms. From acetate of morphia, 1 gr.; spirit of sal volatile and sulphuric ether, of each, 1 fl. oz.; camphor julep, 4 fl. oz.; for a mixture. It should be kept closely corked, in a cool place, and should be well shaken before use.—*Dose.* A teaspoonful in a glassful of cold water or wine, as required. It is a really valuable preparation.

Herrendschwand's Specific. A mixture of gamboge, 10 grs., with carbonate of potassa, 20 grs. (Dr. Paris.)

Holloway's Ointment. The original formula of ALBINOLÉ'S OINTMENT, of which this pretends to be a reproduction, contains the "graisses de serpent et de vipère," and other pharmaceutical curiosities. The principal ingredients, however, in the HOLLOWAY'S OINTMENT of the present day are very homely substances. In the case of *Sillen v. Holloway*, tried at the Court of Common Pleas in January, 1863, the plaintiff's counsel asserted that, on the ointment being received by the agent in Paris, it was submitted to the authorised government chemists to be analysed, in accordance with the law of France prohibiting the sale of secret remedies, and was found by them to contain butter, lard, Venice turpentine, white wax, yellow wax, and nothing else. In a letter to the 'Times,' Professor Holloway stated that the French analysis was incorrect, for three of the ingredients named were not in the ointment, while there were other components which the analysis had not discovered. The formula adopted by those who prepare an imitation ointment on the large scale, and which closely resembles, if it be not actually identical with, that employed by Mr. Holloway, is as follows:—Fresh butter (free from water), $\frac{3}{4}$ lb.; bees' wax (good), 4 oz.; yellow resin, 3 oz.; melt them together, add of vinegar of cantharides, 1 fl. oz., and simmer the whole, with constant agitation, for 10 or 12 minutes, or until the moisture is nearly evaporated; then add, of Canada balsam, 1 oz.; expressed oil of mace, $\frac{1}{2}$ dr.; balsam of Peru or liquid styrax, 10 or 12 drops; again stir well, allow the mixture to settle, and when it is about half cold (not before) pour it into the pots, previously slightly warmed, and allow it to cool very slowly. The label will do the rest. No two samples of Holloway's ointment are precisely of the same colour or consistence.

Holloway's Pills. From aloes, 4 parts; jalap, ginger, and myrrh, of each, 2 parts; made into a mass with mucilage, and divided into 2-grain pills, of which about 4 dozen are put into each ls. 1 $\frac{1}{2}$ d. box.

Jackson's Bathing Spirit. A species of soap

liniment, made of soft soap, 1 lb.; camphor, 6 oz.; oils of rosemary and thyme, of each $\frac{1}{2}$ fl. oz.; rectified spirit, 1 gal.

Kaye's Infant's Preservative. A preparation partaking of the joint properties of Atkinson's nostrum and Godfrey's cordial, but more powerful than either, as indicated by the doses in which it is directed to be given during early infancy, viz., "two, three, or more drops."

Keating's Cough Lozenges. These are said to be composed of—Lactucarium, 2 drs.; ipecacuanha, 1 dr.; squills, $\frac{1}{2}$ dr.; extract of liquorice, 2 oz.; sugar, 6 oz.; made into a mass with mucilage of tragacanth, and divided into 20-gr. lozenges.

King's Sarsaparilla Pills. From the compound extract. "Instead of two pills being equivalent to $\frac{1}{2}$ fl. oz. of the concentrated decoction or essence of sarsaparilla, as asserted, it takes about 32 of them to represent the given quantity, and about 4 of them to be equal in strength to the common decoction of the Pharmacopœia." "Instead of one 2s. 9d. box of these pills being equal to a pint of the costly concentrated fluid preparation, it would take nearly $1\frac{1}{2}$ lb. of them for that purpose." ('Med. Circ.,' ii, 493.)

Kitchener's Peristaltic Persuaders. See PILLS.

Lambert's Asthmatic Balsam. The active ingredients in this compound are said to be squills and aqueous extract of opium.

Lemazurier's Odontalgic Essence. From acetate of morphia, 1 gr.; dissolved in cherry-laurel water, 1 oz. For use, a teaspoonful is added to $\frac{1}{2}$ a wine-glassful of warm water, and the mouth well rinsed out with the mixture.

Leroy's Purgative.—*a.* (No. 1.) Vegetable turbit, 6 drs.; scammony, $1\frac{1}{2}$ oz.; jalap, 6 oz.; brandy, 10 pints; digest for 24 hours, and add a syrup made of senna, 6 oz.; water, $1\frac{1}{2}$ pint; sugar, 32 oz.

b. (No. 2.) As the last, only 1-3rd stronger.

c. (No. 3.) Twice as strong as No. 1.

Lewis's Electuarium. A liquid nostrum, said to be alterative and to contain a small quantity of both antimony and mercury.

Lewis's Basilic Ointment. This preparation, which is declared by its proprietor to be "utterly unsurpassable," for the most part resembles Holloway's ointment. ('Med. Circ.,' ii, 493.)

Lewis's Silver Cream. This nostrum is said to depend for its efficacy on white precipitate and a salt of lead.

Locock's Pulmonic Lozenges. See WAFERS.

Mahomed's Paste. See ELECTUARY.

Mardant's Norton's Drops. A mixture of the tinctures of gentian and ginger, holding in solution a little bichloride of mercury, and coloured with cochineal.

Marriott's Dry Vomit. A mixture of equal parts of tartar emetic and sulphate of copper.

Marsden's Drops. A coloured solution of corrosive sublimate. (Dr. Paris.)

Matthieu's Vermifuge.—*a.* (To destroy the worms.) Tin filings, 1 oz.; male fern root, 6 drs.; worm seed, 4 drs.; resinous extract of jalap and sulphate of potassa, of each, 1 dr.; honey, q. s. to form an electuary.—*Dose.* A teaspoonful, repeated every third or fourth hour, for 2 or 3 days, when the following is to be substituted, and continued until the bowels are well acted on.

b. (To expel the worms.) Jalap and sulphate of potassa, of each, 40 grs.; scammony, 20 grs.; gamboge, 10 grs.; honey, q. s. as before.

McKinsey's Golden Cerate. This appears to resemble Poor Man's Friend.

McKinsey's Katapotia. This notorious nostrum is compounded of aloes, 5 oz.; soap, $1\frac{1}{2}$ oz.; (both in powder;) beaten up with syrup of saffron and a little essential oil, and divided into pills varying in weight from 2 to $2\frac{1}{2}$ grs. each. ('Med. Circ.,' iv, 86.)

McKinsey's Medicinal Powder. *Syn. Rev. T. SMITH'S M. P.* From dried lavender flowers and rosemary tops, of each, $2\frac{1}{2}$ oz.; asarabacca, 1 oz.; reduced to powder, and further disguised with a little perfume. A very small quantity of subsulphate of mercury is also most probably added. Two or three pinches of this powder, taken 3 or 4 times a day, as snuff, is said by the proprietor to be sufficient to cure almost every known disease. See ASARABACCA.

Morison's Aperient Powder. A mixture of cream of tartar and lump sugar, in nearly equal proportions, with sufficient powdered cassia to give it an aromatic flavour. See PILLS.

Morrison's Adhesive Paste. See PLASTER.

Ollivier's Biscuits. Take of the white of 2 eggs; water, $\frac{1}{2}$ pint; beat them together, strain the mixture, and add to it a solution of bichloride of mercury, 76 grs.; collect the precipitate, wash, dry, powder, and carefully weigh it; next add it to such a quantity of flour &c., that each 2-dr. biscuit may contain exactly $\frac{1}{2}$ gr.

Papier Payard. See PAPER (Gout).

Pâte Arsenicale. A powder composed of arsenious acid, 8 grs.; dragon's blood, 22 grs.; cinabar, 70 grs. It is to be made into a paste with the saliva at the time of applying it. A favorite remedy in cancer on the Continent. (Dr. Paris.)

Perry's Balm of Syriacum. From English gin, 1 pint; moist sugar, $\frac{1}{2}$ lb.; (dissolved in) water, 4 oz.; mix, and add of paragoric Tinct. Camph. Co.—Ph. L. 1836), 1 oz. tincture of tolu, $\frac{1}{2}$ oz.; tincture of cantharides, q. s.; together with a few drops each of the oils of aniseed and spearmint; agitate well together, and the next day filter, or decant the clear portion.

Perry's Preventive Lotion. This is said to be a solution of sal alembroch, 2 drs., in water,

1 pint. For use, it is diluted with 4 or 5 times its bulk of water.

Pieste's Toothache Essence. From liquor of ammonia, 2 parts; laudanum, 1 part. It is applied on lint.

Pilules Angéliques. *Syn.* GRAINS DE SANTÉ. Take of aloes and juice of roses, of each, 4 oz.; juices of borage and chicory, of each, 2 oz.; beat them together, and when they are reduced to the consistence of a soft pill-mass, add of powdered rhubarb, 2 drs., powdered agaric, 1 dr., and divide the mixture into 1½-gr. pills. A good purgative. *Dose.* 4 to 12.

Poor-man's Friend (French). See OINTMENT (Brown).

Poor-man's Friend (Dr. Roberts'). This consists chiefly of ointment of nitric-oxide of mercury.

Pringle's Remedy for Typhus. (Dr. Paris.) Pale cinchona (bruised), ½ oz.; water, 12 fl. oz.; boil them together for 10 minutes, adding, towards the end, Virginian snake-root (bruised), 2 drs.; macerate for an hour in a covered vessel, and to the strained liquid add of dilute sulphuric acid, 2 fl. drs., and when the mixture is cold, further add of spirit of cinnamon, 1 fl. oz. The dose is 2 table-spoonfuls every six hours.

Reynold's Gout Specific. Wine of colchicum disguised by some unimportant additions.

Righini's Odontalgic Drops. A solution of creasote in an equal weight of the strongest rectified spirit, coloured with cochineal, and disguised by the addition of a few drops of oil of peppermint.

Raspini's Styptic. A strong solution of gallic acid in spirit of roses. Dr. A. T. Thomson says that it also contains sulphate of zinc.

Rust's Toothache Paste. See PASTE.

Scott's Drops. *Syn.* TINCTURE OF SOOT. From wood-soot, 2 oz.; assafetida, 1 oz.; brandy or proof spirit, 1 pint. *Dose.* 1 to 2 table-spoonfuls; in hysteria, &c.

Smith's Powder. See MC KINSEY'S POWDER.

Solomon's Anti-impetiginous. A solution of bichloride of mercury disguised by the addition of a little flavouring and tinctorial matter. ('Med. Circ.,' ii, 69, 70.)

Standert's Red Mixture. Take of carbonate of magnesia, 1 oz.; powdered Turkey rhubarb, ½ oz.; tincture of rhubarb, 3 fl. oz.; tincture of opium, 2 fl. drs.; oils of aniseed and peppermint, of each, ½ dr.; (dissolved in) gin or proof spirit, 5 fl. oz.; agitate the whole together, then further add of soft water, 1½ pint. In colic and diarrhoea. *Dose.* A wine-glassful. The spirit is frequently omitted, but then the mixture soon spoils.

Standert's Stomachic Candy. Take of lump sugar, 1 lb.; water, 3 fl. oz.; dissolve by heat; add cardomom seeds, ginger, and rhubarb, of each, 1 oz.; and when the mixture is complete, pour it out on an oiled slab or into moulds.

Storey's Worm Cakes. Take of calomel and

cinnabar of each, 24 grs.; powdered jalap, 72 g s.; ginger, 1 dr.; white sugar, 1½ oz.; syrup, q. s.; mix and divide into a dozen cakes. Resemble 'Ching's lozenges' in their action. (See page 719).

Struve's Lotion. See HOOPING-COUGH LOTION (page 715).

Succession Powder. A mixture of powdered quartz and diamond dust, chiefly the first. *Used* as an escharotic.

Tasteless Ague Drops. A solution of arsenite of potassa. It is the common ague medicine in the fen counties of England.

Turlington's Balsam. See BALSAM OF LIFE (above).

Valangin's Solution of Solvent Mineral. From arsenious acid, ½ dr., dissolved in hydrochloric acid, 1½ dr., and the solution diluted with distilled water, 1½ pint. In ague, &c. It has rather less than half the strength of the solution of arsenite of potassa, Ph. L.

Vance's Cream. See CHILBLAIN.

Wahler's Ointment. See CHILBLAIN.

Ward's Purgin Powder. A mixture of jalap and cream of tartar, equal parts, coloured with a little red bole. *Dose.* A teaspoonful, or more, in broth or beer, twice or thrice daily; in dropsy.

Webster's Diet Drink. A sweetened decoction of betony, dulcamara, guaiacum wood, liquorice root, sarsaparilla, sassafra, thyme, and turmeric.

Wilson's Gout Tincture. This is said to be wine of colchicum.

Wright's Pearl Ointment. Take of white precipitate, 8 oz.; Goulard's extract, 1 pint; rub them to a cream, and add the mixture to white wax, 7 lb., and olive oil, 10 lb., previously melted together by a gentle heat; lastly, stir the whole until it is nearly cold. ('Pharm. Journ.')

Young's Aperient Drink. From carbonate of soda, 2½ drs.; bitartrate of potassa, 3 drs.; (both in crystals;) throw them into a soda-water bottle containing cold water, 8 fl. oz., and immediately cork it down securely, and keep it inverted, in a cool place, until required for use.

Zanetti's Bohemian Restorative Tincture. From crushed raisins, ½ lb.; hay saffron, 2 oz.; aqueous extract of opium, 3 drs.; powdered cochineal, 2 drs.; capillaire and orange-flower water, of each, ½ pint; proof spirit, 3 pints; digested together for a week, and then strained, with expression.

PAULLINIA. See GÜBARANA.

PAYNIZING. The name given to Mr. Payne's process for preserving and mineralising wood. See DRY-ROT.

PEACH. *Syn.* PERSICUM, L. The fruit of *Amgdalus Persica*. Two varieties are known in our gardens—CLINGSTONE PEACH and FREESTONE PEACH, terms which explain themselves. The fruit is wholesome; but the flowers and kernels contain prussic acid, and are poisonous.

PEACH'WOOD. The produce of a species of *Cesalpinia*, now extensively used in calico-printing.

PEAR. *Syn.* PYRUS, L. The fruit of *Pyrus communis* (Linn.), one of the rosacea. Its general qualities resemble those of the apple.

PEAR FLAVOUR. See ESSENCE.

PEARL. *Syn.* MARGARITA, MARGARITUM, PERLA, UNIO, L. The most beautiful and costly pearls are obtained exclusively from the pearl oyster (*Meleagrina margaritifera*) of the Indian Seas. The principal fisheries are on the coast of Ceylon, and at Olmutz, in the Persian Gulf. An inferior description of pearl is procured from a fresh-water shell-fish (*Unio margaritifera*) in the neighbourhood of Omagh, county of Tyrone. A similar quality is also procured from the river Ythan, Aberdeenshire. It is probable that pearls from this source, collected by the ancient Britons, may have given rise to the statement by Tacitus, in his *Life of Agricola*, of pearls "not very orient, but pale and wan," being among the indigenous products of Great Britain.

Pearls are composed of membrane and carbonate of calcium; or, in other words, of substances similar to bladder and chalk, in alternate layers.

The cause of the production of pearls is highly curious and interesting. When any foreign body gains a permanent lodgment within the shells of any of the mollusca which are lined with pearly matter, or nacre, the pearly secretion of the animal, instead of being spread in layers on the inside of its habitation, is accumulated around the offending particles in concentric films of extreme tenuity, and more or less spherical, forming a pearl.

Pearls were formerly used in medicine as absorbents or antacids; and among the ancients they were occasionally taken, dissolved in acid, both as a remedy and for the purpose of displaying the careless opulence and luxury of their possessors. A perfect pearl, large, truly spherical, highly iridescent, and reflecting and decomposing the rays of light with vivacity, claims to rank with the most costly of the gems, and in some parts of the East is, with justice, more highly prized than even the diamond. In Europe, however, the present estimation of their value is somewhat different. "A handsome necklace of Ceylon pearls, smaller than a large pea, costs from £170 to £300; but one of pearls about the size of peppercorns may be had for £15. The pearls in the former sell at a guinea each, and those in the latter at about 1s. 6d." (Milburn.) Seed pearls are of little value, however beautiful.

Pearl, Artificial. These are hollow spheres or beads of glass, perforated with two holes at opposite sides to permit of their being strung into necklaces. A small portion of essence of orient is introduced into each, by suction,

and is then spread over the inner surface of the glass. When this has become dry and hard, the globe is filled up with white wax, spermaceti, or gum arabic. The glass of which the beads are formed is slightly bluish and opalescent, and very thin. The latest improvement consists in removing the glassy appearance of the surface of the prepared bead, by exposure to the fumes of hydrofluoric acid, highly diluted.

Pearl, Mother of. *Syn.* UNIONUM CONCHÆ, L.; NACRE DE PERLE, Fr. This is the internal or nacreous layer of those shells which produce the pearls for ornamenting the person; hence the term 'mother of pearl' is by no means inappropriate. It is also derived from several other species, known in trade as ear-shells, green snail-shells, Bombay-shells, &c.

The brilliant hues of mother of pearl do not depend so much upon the nature of the substance as on its structure. Its surface is covered by minute corrugations or furrows, which give a chromatic appearance to the reflected light. Sir David Brewster was the first to show that this substance is capable of imparting its iridescent appearance to fusible metal or fine black wax.

Mother of pearl is cut and wrought with nearly similar tools to those used for ivory, but its treatment, owing to its more fragile nature and delicate structure, requires considerably greater care. It is polished with colcothar or putty powder.

The numerous applications of mother of pearl, for buttons and knife-handles, boxes, inlaying work, &c., are well known.

PEARL ASH. This is prepared by calcining the crude potashes on a reverberatory hearth, dissolving the calcined mass in water, and, after repose, decanting the clear solution, and evaporating it to dryness in flat iron pans, the product being constantly stirred towards the end to reduce it to a semi-granular state. Although purer, its richness in absolute alkali is less than that of the potashes from which it is prepared, being only from 47 to 51½. This exists almost entirely under the form of carbonate. The commercial value of this substance is determined by the ordinary processes of ALKALIMETRY.

PEARL BARLEY. See BARLEY.

PEARLS (Rose). *Syn.* ROSE BEADS. The petals of red roses beaten in an iron mortar for some hours, until they form a smooth, black paste, then rolled into beads and dried. Hard; very fragrant; take a fine polish.

PEARL WHITE. This is subchloride of bismuth; but the name is now commonly applied to trisnitrate of bismuth, which is sold for it.

PEAS. *Syn.* GARDEN PEAS, MOTOR P.; PISA, L. The seed of *Pisum sativum* (Linn.). Poggiale found in 100 parts of common green peas, dried and shelled, 57 of starch, 21.7 of a nitrogenous substance (legumin), 1.9 of fatty matter, 3.2 of cellulose, 2.8 of ash, and 12.7 of

water. In the fresh state (GREEN PEAS) they are nutritive, and, with the pods which contain them, are highly serviceable in scurvy. The last have been used for making beer. The dried seeds are still more nutritious, but are heavy and flatulent unless well cooked. For kitchen use, 'SPLIT PEAS' should be chosen, and after having washed them in a little clean soft water, and allowed them to drain, they should be left to soak in cold soft water for at least 12 hours before applying heat to them, and should then be dressed in the same water in which they have been soaked, and be only gently simmered until they are reduced to a pulp. Additions of meat, vegetables, &c., should not be made until they have nearly arrived at this condition. 'WHOLE PEAS' require soaking for at least 18 or 20 hours.

A substitute for green peas in winter may be obtained by placing the dried seed on a flat dish, sprinkling them with water, and keeping them in a warm situation. In a few days germination commences, and, after it has proceeded sufficiently far, the whole is dressed in the usual manner. An easier and simpler plan is to preserve the green peas, when they are in season, by the common method adopted for gooseberries and other like fruit.

Peas, Is'sue. *Syn.* PISA PRO FONTICULIS, L. Orange berries, or the small unripe fruit of the orange tree, dried, and smoothed in a lathe. See ISSUE.

PEBBLE. The trade name for the transparent colourless variety of rock crystal or quartz used for the lenses of spectacles instead of glass, over which, from its extreme hardness, it has the advantage of being little apt to be scratched.

PECTIC ACID. The name given by Bracconot to an acid which is found very generally diffused throughout the vegetable kingdom, and analogous to jelly.

Prep. From carrot roots, from which the juice has been pressed out, by boiling them with $\frac{1}{10}$ th part of their weight of carbonate of potassa, and about 6 times their weight of water, until the liquid becomes gelatinous when neutralised with an acid. A pectate of potassium is formed, from which the acid may be obtained by neutralising the alkali with a stronger acid, or by carefully adding a solution of chloride of calcium as long as a gelatinous precipitate (pectate of calcium) falls, and, after washing this with water, decomposing it with dilute hydrochloric acid.

Prop., &c. A colourless jelly, having an acid reaction; scarcely soluble in cold water, more so in hot water; and precipitated by acids, alkalis, alcohol, salts, and even sugar. Its compounds with the bases are called pectates. By long boiling with solution of caustic alkali it is converted into metapectic acid, which does not gelatinise. (See below.)

PECTIN. *Syn.* VEGETABLE JELLY. Obtained by adding alcohol to the juice of ripe currants or other fruit, until a gelatinous pre-

cipitate forms, which must be drained, washed with a little weak alcohol, and dried.

Prop., &c. In the moist state it forms a neutral, tasteless, soluble, transparent jelly; when dried, a translucent mass, closely resembling isinglass; boiled with water, or with dilute acids, it is converted into parapectin and metapectin; in the presence of alkalies, these, as well as pectin, are changed into pectic acid, and, by continuing the ebullition for some time longer, into metapectic acid, which is not gelatinous. See PECTIC ACID.

PECTORALS. Under this head are popularly included all the various remedies employed in breath or chest diseases.

PEDICULI. Three species of these parasites infest the human body:—**PEDICULUS HUMANUS CAPITIS**, or HEAD LOUSE, which lives and breeds in the hair of the scalp, and does not voluntarily extend its ravages beyond it;—**P. H. CORPORIS**, or BODY LOUSE, which resides on the trunk of the body and the garments, and is characterised by being white and nearly immaculate; and **P. PUBIS**, or CRAB LOUSE (so named from the cheliform structure of its legs), found chiefly on the pubes, but if not checked, gradually extending itself to the armpits, eyebrows, and other parts covered with hair. This is the most malignant species of the three, and frequently burrows so deeply in the skin as to be with difficulty dislodged.

The presence of pediculi is, in general, an indication of dirty habits, or of contact with the filthy and lazy. Persons who perform the duties of the toilet with ordinary care, and who change their linen sufficiently often, are utter strangers to the visitations of these insects. The use of the hair-brush, strong scents, oil, soap-and-water, and the like, are incompatible with their existence. For the destruction of the *p. pubis*, a solution of from 15 to 20 grs. each of bichloride of mercury and sal ammoniac, in a pint of distilled or pure soft water, is most cleanly and effective. Weak tobacco water, decoction of stavesacre seeds or of white hellebore, and the ointments of mercury, sulphur, and white precipitate, are also frequently employed for the same purpose. See ACARI, VERMIN, &c.

PELICLE. See CRYSTALLISATION.

PELLITORY. *Syn.* PELLITORY OF SPAIN; (PELLITORY ROOT; PYRETHRI RADIX, B. P.); PYRETHRUM (Ph. L. & E.), L. The root of *Anacyclus Pyrethrum*. It is a powerful tropical excitant. It is chiefly employed as a masticatory in headache, toothache, palsy of the tongue, and facial neuralgia and rheumatism; and, made into a tincture with rectified spirit, it is a common remedy among dentists for the toothache. Internally, it has been given as a gastric stimulant, and in intermittents, &c. $\frac{1}{2}$ to 1 dr. may be chewed at a time.

PELTRY. The name applied to fur skins in the state in which they are received from the hunters. To prepare them as furs, the

inside of them is generally first 'tawed' by the application of a solution of alum. They are next well dusted over and rubbed with hot plaster of Paris or whiting, and are, lastly, thoroughly dried and brushed clean. When it is desired to change or modify their colour, the grease being removed by lime water or a weak soda lye, they are stretched out on a table or board, and the ordinary liquid mordants and dyes are applied to them hot, by means of a painter's brush.

The furs of the rabbit and hare are rendered fit for the purposes of the felt and hat manufactures by a process called by the French 'secretage.' This consists in thoroughly moistening the hair with a solution of quicksilver, 1 part, in aquafortis, 16 parts, diluted with half to an equal bulk of water. This is applied with a brush, and the moistened skins being laid together, face to face, are dried as rapidly as possible in a stove room. See FURS.

PENCILS. This name is applied to the small brushes made of camel's hair used by artists, as well as to the plumbago crayons familiarly known as black-lead pencils. The last are prepared by one or other of the following methods:—

1. The blocks of plumbago are exposed to a bright-red heat in a closely covered crucible, and are afterwards sawn into minute sticks, and mounted in cases of cedar or satin wood.

2. The plumbago, in powder, is calcined as before, and then mixed with an equal, or any other desired proportion of pure washed clay, also in powder, after which the mixture is reduced to a plastic state with water, and pressed into grooves cut on the face of a smooth board, or into well-greased wooden moulds, in which state it is left to dry. When dry, the pieces are tempered to any degree of hardness by exposing them, surrounded by sand or powdered charcoal, in a closely covered crucible, to various degrees of heat. The crucible is not opened until the whole has become cold, when the prepared 'slips' are removed and mounted as before. This method was invented by M. Conté, in 1795.

3. The dough or paste, prepared as last, is reduced to the required form by forcing it through a perforated plate (in a similar manner to that adopted for coloured crayons), or into minute metallic cylinders, from which it may be readily shaken after it has become partially dry.

Obs. The leads for some varieties of drawing-pencils are immersed for a minute in very hot melted wax or suet before mounting them. To the composition for others a little lamp-black is added, to increase and vary the degree of blackness. The pencils for asses' skin books and prepared paper are tipped with 'fusible metal.' Numerous improvements in pencil-cases and pencil-mounts have been patented of late years by Stevens and others.

PENNYROYAL. *Syn.* PULEGIUM (Ph. L.

& E.), MENTHA P. (Ph. D.), L. "The recent and dried flowering herb of *Mentha pulegium*, Linn." (Ph. L.) PENNYROYAL TEA is a popular emmenagogue, expectorant, and diaphoretic, and is in common use in asthma bronchitis, whooping-cough, hysteria, suppressions, &c. Water, essence, oil, and spirit of pennyroyal, are official. They are now chiefly used as mere adjuncts or vehicles.

PEPPER (Black). *Syn.* PEPPER; PIPER, B.P.; NIGRI BACCÆ, PIPER NIGRUM (Ph. L. E. & D.), L. "The immature fruit (berry) of *Piper nigrum*, Linn., or the black pepper vine." (Ph. L.)

Pur. The ground black pepper of the shops is universally adulterated. In fact, the public taste and judgment are so vitiated, that the pure spice is unsaleable. A most respectable London firm, on commencing business, supplied their customers with unadulterated ground pepper, but in 3 cases out of every 4 it was returned on their hands and objected to, on account of its dark colour and rich pungency, which had induced the belief that it was sophisticated. The house alluded to was therefore compelled by the customers to supply them with an inferior, but milder and paler, article. The substances employed to lower black pepper are known in the trade as—'P. D.,' 'H. P. D.,' and 'W. P. D.'—abbreviations of pepper dust, hot p. d., white p. d. The first is composed of the faded leaves of autumn, dried and powdered; the second, the ground husks (hulls) of black mustard, obtained from the mustard mills; and the third is common rice, finely powdered. Equal parts of black peppercorns, H. P. D., and W. P. D., form the very best ground pepper sold. The ordinary pepper of the shops does not contain more than $\frac{1}{4}$ th of genuine pepper, or 2 to 2½ oz. in the lb. Very recently, ground oil-cake or linseed meal has been chiefly employed as the adulterant, instead of the old 'P. D.'

Uses, &c. Black pepper is a powerful stimulant, carminative, and rubefacient. Its use, in moderation, as a condiment, is peculiarly serviceable to persons who are of a cold habit, or who suffer from a weak digestion; but in inflammatory habits, and in affections of the mucous membranes, it is generally highly injurious. As a medicine, it is often serviceable in nausea, vomiting, chronic diarrhoea, and agues. In North America, a common remedy for the last is $\frac{1}{2}$ oz. of ground pepper stirred up with a glassful of warm beer; or a like quantity made into a tincture by steeping it in 5 or 6 times its weight of gin, rum, or whisky, for a few days.

Prepared black pepper is made by steeping the berries for 3 days in 3 times their weight of vinegar, and then drying and grinding them. It is milder than common pepper. See CONFECTIONS, PIPERINE, &c.

Pepper, Cayenne. *Syn.* BIRD PEPPER, CHILI P., GUINEA P., INDIAN P., RED P.; PIPER

CAPSICI, P. CAYENNE, L. This is prepared from chillies, or the pods of *Capsicum frutescens*, or from *Capsicum baccatum*, or bird pepper, but generally from the first, on account of its greater pungency and acrimony; and, occasionally, from *Capsicum annuum* or medicinal capsicum.

Prep. 1. From the dried pods (powdered), 1 lb.; and wheaten bread or captain's biscuits (heated until they are perfectly dry and brittle, and begin to acquire a yellow colour throughout, and then powdered), 7 lbs.; mixed and ground together. Colouring matter and common salt are frequently added, but are unnecessary.

2. As the last, but making the mixture into a dough with water, then forming it into small cakes, drying these as rapidly as possible at a gentle heat, and then grinding them.

3. (London.) The ripe pods, dried in the sun, are stratified with wheaten flour in a dish or tray, and exposed in a stove-room or a half-cold oven until they are quite dry; they are then removed from the flour, and ground to fine powder; to every oz. of this powder, 1 lb. (say 15 oz.) of wheaten flour (including that already used) are added, and the mixture is made into a dough with a little tepid water and a teaspoonful of yeast; after fermentation is well set up, the dough is cut into small pieces, and baked in a slow oven until it is perfectly hard and brittle; it is then beaten or ground to powder, and forms 'cayenne pepper.'

Pure cayenne pepper, when burnt, leaves a scarcely perceptible quantity of white ash; a red-coloured ash indicates the presence of red ochre, brick-dust, Armenian bole, or other earthy colouring matter. If red lead is present, it will be left behind under the form of a dark-coloured powder, or a small metallic globule.

Pur. The 'cayenne pepper' of the shops is often a spurious article, made by grinding a mixture of any of the reddish woods or sawdust, with enough red pods or chillies to render the mixture sufficiently acrid and pungent. Common salt, colcothar, red bole, brick-dust, vermilion, and even red lead, are also common additions.

Uses, &c. The capsicums resemble the peppers, except in their greater energy and their pungency being unmodified, by the presence of essential oil. As a condiment, under the form of cayenne pepper, and in all diseases in which the employment of a powerful stimulant or rubefacient is indicated, their uses are well known. In medicine, the fruit of *Capsicum annuum* (Linn.—Ph. E. & D.; *C. fastigiatum*, Blume—B.P., Ph. L.), or annual capsicum is ordered (CAPSICUM—Ph. L. E. & D.). The London College directs the fruit to be that of 'Guinea,' less than one inch long, oblong, cylindrical, and straight." See **ESSENCE OF CAYENNE**.

Pepper, Prepared Cayenne, is the residuum of cayenne—vinegar, essence, or tincture, dried and ground (see *below*).

Pepper (Soluble), Cayenne. *Syn.* **CRYSTALLISED SOLUBLE CAYENNE.** *Prep.* 1. Capsicum pods (recent, ground in a pepper mill), 1 lb.; rectified spirit, 2½ pints; proceed by percolation so as to obtain 2½ pints; from this distil one half of the spirit by the heat of a water bath; to the residuum add of fine dry salt, 5 lbs.; mix them well together, and dry the mixture at a very gentle heat, frequently stirring; lastly rub it through a sieve, and put it into warm dry bottles. It is usually coloured with a little vermilion or rouge (sesquioxide of iron), but it possesses an agreeable colour without it.

2. Essence of cayenne (No. 1, page 580), 6 pints; distil off 3 pints, add to the residual liquor, of dry salt, 12 lbs.; mix well, dry by a gentle heat, and otherwise proceed as before.

3. Capsicums (ground), 3 lbs.; red sanders or Brazil wood (sliced or rasped), 10 oz.; rectified spirit, 1 gal.; macerate for 14 days, then express the tincture, filter, distil off one half, add of dry salt, 15 lbs., and proceed as before.

4. As the first formula, with the addition of a strong decoction of saffron, q. s. It gives a beautiful colour to soups, &c.

Obs. The above formulæ are those actually employed by the houses most celebrated for their 'soluble cayenne.' The products are of the very finest quality, and are perfectly wholesome. We speak from an extensive experience in the manufacture. The spirit distilled from the essence forms a most suitable menstruum for making fresh essence or tincture of cayenne.

Pepper, Cu'beb. See **CUBEBS**.

Pepper, Jama'ca. See **PIMENTO**.

Pepper, Kit'chen. See **SPICE**.

Pepper, Long. *Syn.* **PIPERIS LONGI FRUCTUS, PIPER LONGUM** (Ph. L. & E.), L. "The immature fruit (dried female spikes) of *Piper longum*, Linn." (Ph. L.), or long-pepper vine. The spikes are about 1½ inch in length, with an indented surface, and are of a dark-gray colour. In its general properties it resembles black pepper, but it is less aromatic, though equally pungent. Elephant pepper is merely a larger variety of this species. (Gray.) The root and stems, sliced and dried, form the 'pippula moola' of the East Indies. (Roxburgh.)

Pepper, Red. See **CAYENNE PEPPER**.

Pepper, White. *Syn.* **PIPER ALBUM, L.** This is made by either soaking ordinary black pepper in a solution of common salt, until the outside skins are soft, and then rubbing them off in the hands, or by merely rubbing off the skins of the over-ripe berries that fall from the vines. An inferior quality is made by bleaching black pepper with chlorine.

Obs. The use of white pepper instead of

black is an instance of the sacrifices made to please the eye. Pure white pepper has only about 1-4th of the strength of pure black pepper, whilst it is nearly destitute of the fine aroma of the latter. It also contains a mere trace of piperina or piperine, one of the most valuable constituents of black pepper.

PEPPER PODS. Capsicums. See **CAYENNE PEPPER**.

PEPPERMINT. *Syn.* **MENTHA PIPERITA** (Ph. L. E. & D.), L. "The recent and dried flowering herb of *Mentha piperita*" (Ph. L.), or garden peppermint. The flavour and odour of this herb are well known. It is the most pleasant and powerful of all the mints. Peppermint water and the essential oil have long been employed in nausea, griping, flatulent colic, hysteria, diarrhoea, &c.; but in regular practice chiefly to cover the taste of nauseous medicines, or as an adjunct or vehicle for more active remedies. See **OILS (Volatile)**, **WATERS**, &c.

PEPSIN. *Syn.* **GASTERASE**, **CHYMOSIN**. A peculiar principle found in the gastric juice, and which, in conjunction with hydrochloric acid, also present in the stomach, confers upon it the power of digesting certain portions of the food, and of dissolving, as Tuson has recently shown, calomel and other mineral substances.

Prep. 1. (Beale, 'Med. Times & Gaz.,' February 10th, 1872, p. 152.) "The mucous membrane of a perfectly fresh pig's stomach is carefully dissected from the muscular coat, and placed on a flat board. It is then lightly cleansed with a sponge and a little water, and much of the mucus, remains of food, &c., carefully removed. With the back of a knife, or with an ivory paper-knife, the surface is scraped very hard, in order that the glands may be squeezed and their contents pressed out. The viscid mucus thus obtained contains the pure gastric juice with much epithelium from the glands and surface of the mucous membrane. It is to be spread out upon a piece of glass, so as to form a very thin layer, which is to be dried at a temperature of 100° over hot water, or *in vacuo* over sulphuric acid. Care must be taken that the temperature does not rise much above 100 F°, because the action of the solvent would be completely destroyed. When dry the mucus is scraped from the glass, powdered in a mortar, and transferred to a well-stoppered bottle. With this powder a good digestive fluid may be made as follows:

Of the powder 5 grains.

Strong hydrochloric acid. 18 drops.

Water 6 ounces.

Macerate it at a temperature of 100° for an hour. The mixture may be filtered easily, and forms a perfectly clear solution very convenient for experiment.

"If the powder is to be taken as a medicine, from two to five grains may be given for a dose, a little diluted hydrochloric acid in water being taken at the same time. The pepsin

powder may be mixed with the salt at a meal. It is devoid of smell, and has only a slightly salt taste. It undergoes no change if kept perfectly dry, and contains the active principle of the gastric juice almost unaltered.

"The method of preparing this pepsin was communicated to Mr. Bullock, of the firm of Messrs. Bullock and Reynolds, 3, Hanover Street, Hanover Square, who at once adopted it for the preparation of medicinal pepsin, and soon improved upon it in some particulars. The dose is from 2 to 4 or 5 grains. *Test.* 8 grains of this pepsin, with 10 drops dilute hydrochloric acid and an ounce of distilled water, dissolve 100 grains of hard-boiled white of egg in from twelve to twenty-four hours. In the body probably twice this quantity of white of egg or even more would be dissolved in a comparatively short space of time. The digestive powder prepared from the pig's stomach retains its activity for any length of time if kept dry. I had some which had been kept in a bottle for upwards of five years, and still retained its active power unimpaired. The solution made with this pepsin and hydrochloric acid was nearly tasteless and inodorous. One pig's stomach, which cost sixpence, will yield about 45 grains of the powder prepared as above described.

"Gradually the usefulness of this preparation of pepsin of the pig was found out, and it had to be prepared in increasing quantities. I should be afraid to say how many pigs' stomachs have been used of late years during the winter season.

"In 1857 Dr. Pavy carefully examined the pepsin prepared and sold by many different firms, and found that this dried mucus of the pig's stomach was the most active of them all ('Medical Times and Gazette,' 1857, vol. i, p. 336). In 1870 Professor Tuson instituted a still more careful comparative examination, and with a similar result ('Lancet,' August 13th, 1870); for he found that this preparation was *twenty-five times stronger than some others that he obtained for examination.*"

2. (Scheffer, 'Pharm. Journ.,' March 23rd, 1872, p. 761.) "Of the well-cleaned fresh hog stomach the mucous membrane is dissected off, chopped finely and macerated in water acidulated with muriatic acid for several days, during which time the mass is frequently well stirred. The resulting liquid, after being strained, is, if not clear, set aside for at least twenty-four hours in order to allow the mucus to settle. To the clarified liquid the same bulk of a saturated solution of sodium chloride is added, and the whole thoroughly mixed. After several hours the pepsin, which by the addition of chloride of sodium has separated from its solution, is found floating on the surface, from whence it is removed with a spoon and put upon cotton cloth to drain; finally it is submitted to strong pressure, to free it as much as possible from the salt solution.

"The pepsin, when taken from the press and

allowed to become air dry, is a very tough substance, and presents, according to thickness, a different appearance, resembling in thin sheets parchment paper, and in thick layers sole leather; its colour varies from a dim straw yellow to a brownish yellow. Besides a little mucus, it contains small quantities of phosphate of lime and chloride of sodium, which, however, do not interfere with its digestive properties, as they are found also in normal gastric juice.

"In order to get a purer article I redissolve the pepsin, as obtained after expression, in acidulated water, filter the solution through paper and precipitate again with a solution of sodium chloride; the precipitate, after draining and pressing, is now free of phosphate of lime and mucus, but still contains salt. In the freshly precipitated state the pepsin is very readily soluble in water, and cannot therefore be freed from adhering salt by washing.

"By allowing the pressed sheet of pepsin to get perfectly air dry—whereby it becomes coated with a white film and small crystals of chloride of sodium—and by immersing it then in pure water for a short time, the greater part of sodium chloride can be extracted, but it has to be done very rapidly, as the pepsin swells up considerably and loses its tenacity. By operating in this manner I have obtained a pepsin which dissolves in acidulated water to quite a clear colourless liquid, but as it still contains traces of salt, I prefer to call it purified pepsin."

Pepsin, Saccharated. To work it into saccharated pepsin ('*American Journal of Pharmacy*, January, 1871) the damp pepsin, as it is taken from the press, is triturated with a weighed quantity of sugar of milk to a fine powder, which, when it has become air dry, is weighed again, the quantity of milk sugar subtracted, and so the amount of pepsin found. The strength of this dry pepsin is now ascertained by finding how much coagulated albumen it will dissolve at a temperature of 100° F. in five or six hours, and after this sufficient milk sugar is added to result in a preparation of which ten grains will dissolve one hundred and twenty grains of coagulated albumen, and this preparation I have called saccharated pepsin.

PERCHLORATE. *Syn.* PERCHLORAS, L. A salt of perchloric acid.

The perchlorates are distinguished from the chlorates by their great stability, and by not turning yellow when treated with hydrochloric acid. Like the chlorates, they give off oxygen when heated to redness. They may be prepared by directly neutralising a solution of the acid with a solution of the base. See POTASSIUM (Perchlorate of), and CHLORINE.

PERCHLORIC ACID. See CHLORINE.

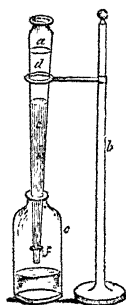

PERCOLATION. *Syn.* METHOD OF DISPLACEMENT. A method of extracting the

soluble portion of any substance in a divided state, by causing the menstruum to filter or strain through it. The 'sparging' of the Scotch brewers is an example of the application of this principle on the large scale. In pharmacy, the 'method of displacement' is frequently adopted for the preparation of tinctures, infusions, &c., and is, in some respects, superior to digestion or maceration. "The solid materials, usually in coarse or moderately fine powder, are moistened with a sufficiency of the solvent to form a thick pulp. In twelve hours, or frequently without delay, the mass is put into a cylinder of glass, porcelain, or tinned iron, open at both ends, but obstructed at the lower end by a piece of calico or linen, tied lightly over it as a filter; and the pulp being backed by pressure, ranging as to degree with different articles, the remainder of the solvent is poured into the upper portion of the cylinder, and allowed gradually to percolate. In order to obtain the portion of the fluid which is absorbed by the residuum, an additional quantity of the solvent is poured into the cylinder, until the tincture which has passed through equals in amount the spirit originally prescribed. The spirit employed for this purpose is then recovered, for the most part, by pouring over the residuum as much water as there is spirit retained in it, which may be easily known by an obvious calculation in each case. The method of percolation is now preferred by all who have made sufficient trial of it to apply it correctly." (Ph. E.)

The first portion of liquid obtained by the method of displacement is always in a state of high concentration. In general, it is a simple solution of the soluble ingredients of the crude drug in the fluid employed. But sometimes the solvent, if compound, is resolved into its component parts, and the fluid which passes through at any given time is only one of these, holding the soluble parts of the drug in solution. Thus, if diluted alcohol be poured over powder of myrrh, in the cylinder of the percolator, the fluid which first drops into the receiver is a solution of an oily consistence, chiefly composed of resin and volatile oil, dissolved in alcohol. In like manner, when the powder of gall-nuts is treated in the same way by hydrated sulphuric ether, two layers of fluid are obtained, one of which is a highly concentrated solution of tannin in the water of the ether, and the other a weak solution of the same principle in pure ether. In all cases, therefore, in which it is not otherwise directed, it is absolutely necessary to agitate the several portions of the liquid obtained by percolation together, in order to ensure a product of uniform strength or activity.

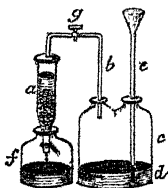

Several forms of displacement apparatus are employed by different operators. A simple and useful one is that figured in the margin. It has also the advantage of being inexpensive, and may be made by any worker in tin plate.

In operating on some substances it is found advantageous to hasten the process by pressure.

- a. Percolator.
- b. Stand.
- c. Receiver.
- d. Menstruum.
- e. Substance operated on.
- f. Calico strainer.

This may be effected by any of the methods adopted for that purpose, and already described under FILTRATION. An ingenious little apparatus, which is well adapted for small quantities, is shown in the *engr.* By pouring mercury or water through (e), into the bottle (c), the air in the latter suffers compression, and acts in a corresponding manner on the percolating liquor in (a). The whole of the joints must be made air-tight.

- a. Percolator.
- b. Tube connecting it with—
- c. A double-necked bottle containing—
- d. Mercury.
- e. Feeding-tube.
- f. Receiver.
- g. Stop-cock to regulate or arrest the pressure of air on the contents of the cylinder (a).

The method of displacement, although apparently simple, requires for its successful application no inconsiderable amount of experience and skill in manipulation. The principal points to be attended to are—the reduction of the substance to the proper state of comminution (neither too coarse nor too fine),—the due regulation of the period of maceration according to the hardness, density, and texture of the substance; and, more important still,—the proper packing of the ingredients in the cylinder. On the correct performance of the last the success of the process mainly depends. Some substances require considerable pressure to be used, whilst others, when even lightly packed, scarcely permit the fluid to pass through them. When the material is too loosely packed, the menstruum passes through quickly, but without exerting its proper solvent action; when too great pressure is employed, percolation either progresses very slowly or not at all. On the whole, the firmness of the packing should be inversely as the solvent and softening power of the menstruum upon the solids exposed to its action; but to this rule there are many exceptions, and each

substance may be said to require special treatment. An excellent plan, applicable to all substances, and especially to those of a glutinous or mucilaginous nature, is to mix the powder with an equal bulk of well-washed siliceous sand before rubbing it up with the menstruum. In reference to the coarseness of the powder, it must be observed that substances which readily become soft and pappy when wetted by the menstruum, should not be used so fine as those that are more woody and fibrous, and not of a glutinous or resinous nature.

The 'method of displacement' has the advantage of expedition, economy, and yielding products possessing considerable uniformity of strength; but the difficulties attending its application by the inexperienced are serious obstacles to its general adoption in the laboratory. It answers admirably for the preparation of all tinctures that are not of a resinous nature, and for most infusions of a woody and fibrous substances, as roots, woods, barks, leaves, seeds, insects, &c., and particularly when cold or tepid water is taken as the solvent. It is also especially adapted for the preparation of concentrated infusions and essences, as they may thus be obtained of any required strength without loss, or requiring concentration by heat, which is so destructive to their virtues.

"When (ordinary) tinctures are made in large quantities, displacement is never likely to supersede maceration, on account of any practical advantages it may possess. If the prescribed directions be duly attended to, the process of maceration is unexceptionable. The process is more simple than the other; the mode of operating is more uniform, it is, in fact, always the same; it requires less of skill and dexterity in conducting it; it requires less constant attention during its progress, which, in operating on large quantities is a consideration; and, finally, the apparatus required is less complicated. When, however, only small quantities of tincture are made at a time, and kept in stock, the adoption of the process of displacement will often be found convenient and advantageous. It offers the means of making a tincture in two or three hours, which, by the other process, would require as many weeks." (Mohr and Redwood.)

Another useful application of the method of displacement is to the manufacture of extracts on the large scale. Here it is superior to any other plan. By the simple and inexpensive forms of apparatus in block-tin, stoneware, or glass, which have recently been designed for the purpose, not merely a first-class product is ensured, but a great saving in fuel and labour is at the same time effected. See BREWING, EXTRACT, TINCTURE, &c.

PERCUSSION. *Syn.* PERCUSSIO, L. In medicine, the act of striking any part of the body with the fingers, or any instrument, to ascertain its condition. See AUSCULTATION.

PERCUS'SION CAPS. The composition employed to prime these articles is noticed under **FULMINATING MERCURY**.

PER'FECT LOVE. See **LIQUEUR** (Parfait Amour).

PERFUME. A substance that emits or casts off volatile particles which, when diffused through the atmosphere, agreeably affect the organs of smelling. The term is also applied to the volatile effluvia so perceived. The principal source of perfumes is the Vegetable Kingdom. Its flowers, seeds, woods, and barks, furnish a rich variety, from which the most fastidious connoisseur may select his favourite bouquet. A few perfumes, as musk, ambergris, and civet, are derived from the Animal Kingdom; but none of these evolve an aroma comparable in freshness to that of the rose, or in delicacy to that of the orange-blossom, or even the unpretending jasmine. The Inorganic Kingdom yields not a single perfume, so called; nor has the science of chemistry yet been able to produce a single odoriferous compound from matter absolutely inorganic.

PERFU'MERY. Perfumes in general; also the art of preparing them. In its commercial application, this word embraces not merely perfumes, but also cosmetics, and other articles of a closely allied character employed at the toilet, the manufacture and sale of which constitute the trade of the modern perfumer. Formulas for the preparation of all the more valuable perfumes, as well as of others met with in trade, both simple and compound, will be found under the heads **COSMETICS**, **DEPILATORY**, **ESSENCE**, **HAIR DYES**, **OILS**, **PASTES**, **PASTILS**, **POMMADE**, **SPIRIT**, **WATERS**, &c., to which we refer the reader.

Perfumes, Ac'etic. See **VINEGAR**.

Perfumes, Ammo'niated. These may be prepared by simply adding a sufficient quantity of ammonia to the liquid perfumes. When the articles are to be distilled, a cheaper plan is to add about 5 drs. of sal ammoniac and 8 drs. of carbonate of potassa to each pint of the article just before distillation. Ammoniated Cologne water is now a fashionable substitute for spirit of sal volatile.

PERIODIC ACID. See **IODINE**.

PERISTALTIC PERSUADERS. See **PILLS** (Kitchener's).

PER'MANENT WHITE. See **BARYTA** (Sulphate) and **WHITE PIGMENTS**.

PERNAMBUCO WOOD. *Syn.* **PEACH WOOD**. The wood of *Cesalpinia echinata*. It constitutes the paler variety of Brazil wood used by the dyers.

PER'RY. *Syn.* **PYRACEUM**, **L.** A fermented liquor prepared from pears in the same way as cider is from apples. The red rough-tasted sorts are principally used for this purpose. The best perry contains about 9% of absolute alcohol; ordinary perry, from 5 to 7%.

Perry is a very pleasant-tasted and wholesome liquor. When bottled 'champagne

fashion,' we have seen it frequently passed off for champagne, without the fraud being suspected.

PER'SIAN BERRIES. See **FRENCH BERRIES**.

PERSPIRATION. The liquid or vapour secreted by the ramifications of the cuticular arteries over the surface of the body. The perspiratory apparatus consists of a gland deeply seated in the corium, communicating by means of tubules (pores) with the surface of the scarf-skin.

The uses of the perspiratory functions appear to be to preserve the suppleness and sensibility of the skin, to maintain the temperature of the body at a uniform standard, and to remove from the system a number of compounds noxious to animal life. The perspiration "is a fluid whose regularity and continuance of exhalation are not merely conducive but absolutely necessary, to health; without such regularity, the animal temperature would run riot, and substances of an injurious quality would be allowed to permeate the finest and most delicate of the tissues of the body." (Eras. Wilson.) "From the constriction or constipation of the cutaneous pores by the ambient air, especially when the body, beforehand put into a heat, is suddenly exposed thereunto, the serous particles, which used to fly off continually in vapour, being now pent in, excite an intense and feverish effervescence; till, finding some other passage, either by the kidneys or by the glandules of the nose and windpipe, they are discharged by way of a catarrh; or, missing this separation, still keep up the ebullition, very often to the hazard of life, by suffocating the vital flame. And this is the natural consequence of obstructed insensible perspiration, which, in the vulgar phrase, is the same with what they mean by catching cold, and of which, give me leave to remark, that as fevers make two thirds of diseases infesting mankind, according to the computation of the judicious Sydenham, so two thirds of fevers very probably may take their rise from perspiration hindered." (Daniel Turner.) Suppressed perspiration is also one of the commonest causes of diarrhoea.

PERUVIAN BALSAM. See **BALSAM OF PERU**.

PERUVIAN BARK. See **CINCHONA**.

PES'SARY. *Syn.* **PESSEUM**, **PESSARIUM**, **L.** An instrument made of caoutchouc, gutta percha, box-wood, or ivory, inserted into the vagina to support the mouth and neck of the uterus. They are variously formed, to meet the prejudices of the party or the necessities of the case. The cup, conical, globe, and ring pessaries (pessi) are those best known.

Medicated pessaries are prepared by adding the active ingredients to a hard cerate, and pressing the mixture into the desired form. Astringents (various), belladonna, acetate of

lead, iodine, mercury, opium, &c., have been thus applied by Dr. Simpson and others.

PESTILENCE. See *PLAGUE*.

PESTILENTIAL DISEASES. All those diseases which are epidemic and malignant and assume the character of a plague. See *CHOLERA*, &c.

PETONG'. Same as *packfong*.

PETROLENE. The pure liquid portion of mineral tar. It has a pale yellow colour, a penetrating odour, and a high boiling-point; is lighter than water, and is isomeric with the oils of turpentine and lemons. In its general proportions, it resembles rectified mineral naphtha.

PETROLEUM. *Syn.* ROCK OIL, LIQUID BITUMEN, OIL OF PETREE; OLEUM PETRÆ, BITUMEN LIQUIDUM, L. PETROLEUM is an oil found oozing from the ground or obtained on sinking wells in the soil. To a limited extent it is met with in most countries of Europe and in the West India islands, but occurs in abundance in Pennsylvania and other parts of the United States and in Canada. It varies in colour from slight yellow to brownish black, in consistence from a thin mobile liquid to a fluid as thick as treacle, in specific gravity from 800 to 1100 (water being 1000) and is either clear and transparent or turbid and opaque. Petroleum is essentially a volatile oil, and when submitted to distillation yields gases homologous with light carburetted hydrogen of marsh-gas (Ronalds obtained three), liquids of similar constitution (Pelouze and Cahours isolated twelve), and solid paraffin-like bodies. Commercially petroleum is distilled so as to yield petroleum-spirit or mineral naphtha used as a substitute for turpentine and for burning in sponge-lamps and costermongers' barrow-lamps; petroleum oil used all over the world as mineral lamp oil for illuminating purposes; and a heavy oil employed for lubricating machinery. The value of a sample of rock-oil is determined by thus distilling a weighed quantity in a small glass retort and weighing the products. The petroleum or middle product must be of such a character as to have a specific gravity not higher than 810 or 820 and to contain so little petroleum spirit that it only evolves inflammable vapour when heated to 100° Fahr. in the manner prescribed in the Petroleum Act, 1871 (see *below*). Any petroleum product or mineral oil which will not stand this test, and which is kept in larger bottles than one pint, and in larger total quantity than three gallons cannot be stored or sold except by licence of the local authorities.

Directions for Testing Petroleum to ascertain the temperature at which it gives off inflammable vapour.

The vessel which is to hold the oil shall be of thin sheet iron; it shall be two inches deep and two inches wide at the opening, tapering slightly towards the bottom; it shall have a flat rim, with a raised edge one quarter of an inch round

the top; it shall be supported by this rim in a tin vessel four inches and a half deep and four and a half inches in diameter; it shall also have a thin wire stretched across the opening, which wire shall be so fixed to the edge of the vessel that it shall be a quarter of an inch above the surface of the flat rim. The thermometer to be used shall have a round bulb about half an inch in diameter, and is to be graduated upon the scale of Fahrenheit, every ten degrees occupying not less than half an inch upon the scale.

The inner vessel shall be filled with the petroleum to be tested, but care must be taken that the liquid does not cover the flat rim. The outer vessel shall be filled with cold, or nearly cold water; a small flame shall be applied to the bottom of the outer vessel, and the thermometer shall be inserted into the oil so that the bulb shall be immersed about one and a half inches beneath the surface. A screen of pasteboard or wood shall be placed round the apparatus, and shall be of such dimensions as to surround it about two-thirds, and to reach several inches above the level of the vessels.

When heat has been applied to the water until the thermometer has risen to about 90° Fahr., a very small flame shall be quickly passed across the surface of the oil on a level with the wire. If no pale blue flicker or flash is produced, the application of the flame is to be repeated for every rise of two or three degrees in the thermometer. When the flashing-point has been noted, the test shall be repeated with a fresh sample of the oil, using cold, or nearly cold, water as before; withdrawing the source of heat from the outer vessel when the temperature approaches that noted in the first experiment, and applying the flame test at every rise of two degrees in the thermometer. See *NAPHTHA*, OILS (Mineral), &c.

PEWTER. This is an alloy of tin and lead, or of tin with antimony and copper. The first only is properly called pewter. Three varieties are known in trade;—

Prep. 1. (**PLATE PEWTER.**) From tin, 89½; antimony, 7½; bismuth and copper, of each, 2½; fused together. *Used* to make plates, teapots, &c. Takes a fine polish.

2. (**TRIPLE PEWTER.**) From tin, 79½; antimony, 15½; lead, 6½; as the last. *Used* for minor articles, syringes, toys, &c.

3. (**LEY PEWTER.**) From tin, 80½; lead, 20½. *Used* for measures, inkstands, &c.

Obs. According to the report of the French commission, pewter containing more than 18 parts of lead to 82 parts of tin is unsafe for measures for wine, and similar liquors and, indeed, for any other utensils exposed to contact with our food or beverages. The legal sp. gr. of pewter in France is 7.764; if it be greater, it contains an excess of lead, and is liable to prove poisonous. The proportions of these metals may be approximately determined from the sp. gr.; but correctly, only by an assay

for the purpose. See BRASS, GERMAN SILVER, LEAD, and TIN.

PHENOL. C_6H_5O . See CARBOLIC ACID.

PHENYL. C_6H_5 . The hypothetical compound radical of the phenyl-series. Carbolic acid is said to be its hydrate.

PHENYLAMINE. $C_6H_5H_2N$. Aniline is sometimes so named on account of its relation to the phenyl series.

PHILONIUM. The ancient name of an aromatic opiate, reputed to possess many virtues, invented by Philo. See CONFECTION OF OPIUM.

PHILOSOPHER'S STONE. *Syn.* LAPIS PHILOSOPHICUM, L. A wonderful substance, the discovery of which formed the day dreams of the alchemists. It was supposed to be capable of converting all the baser metals into gold, and of curing all diseases. Some of the alchemists appear to have laboured under the delusion that they had actually discovered it. The last of these enthusiasts was the talented and unfortunate Dr. Price, of Guildford. Speaking of the age of alchemy, Liebig says,—"The idea of the transmutability of metals stood in the most perfect harmony with all the observations and all the knowledge of that age, and in contradiction to none of these. In the first stage of the development of science, the alchemists could not possibly have any other notions of the nature of metals than those which they actually held. . . . We hear it said that the idea of the philosopher's stone was an error; but all our views have been developed from errors, and that which to-day we regard as truth in chemistry may, perhaps, before to-morrow, be regarded as a fallacy."

PHILOSOPHIC CANDLE. An inflamed jet of hydrogen gas.

PHILOSOPHIC WOOL. Flowers of zinc.

PHILTRE. *Syn.* PHILTREM, L. A charm or potion to excite love. The ancients had great faith in such remedies. Nothing certain is now known respecting their composition; but there is sufficient evidence that recourse was frequently had to them by the ancients, and that "their operation was so violent that many persons lost their lives and their reason by their means." The "Thessalian philtres" were those most celebrated. (Juv., vi, 610, &c.) At the present day the administration of preparations of the kind is interdicted by law.

PHLORETIN. $C_{16}H_{11}O_5$. A crystallisable, sweet substance, formed along with grape sugar, when phloridzin is acted on by dilute acids.

PHLORIDZIN. $C_{27}H_{24}O_{10}$. *Syn.* PHLOREZINE; PHLORIDZINUM, L. *Prep.* By acting on the fresh root-bark of the apple, pear, or plum tree, with boiling rectified spirit; the spirit is distilled off, and the phloridzin crystallizes out of the residual liquor as it cools.

Prop &c. Fine, colourless, silky needles, freely soluble in rectified spirit and in hot water, but requiring 1000 parts of cold water

for its solution; its taste is bitter and astringent. When its solution is boiled with a little dilute sulphuric acid or hydrochloric acid, it is changed into grape sugar and phloretin.

Phloridzin bears a great likeness to salicin. It is said to be a powerful febrifuge. *Dose.* 3 to 15 grs.

PHOENIC ACID. See DELPHINIC ACID.

PHENICINE. See INDIGO PURPLE.

PHOSGENE GAS. See CHLOROCARBONIC ACID.

PHOSPHATE. *Syn.* PHOSPHAS, L. A salt of phosphoric acid. See PHOSPHORIC ACID and the respective metals.

PHOSPHIDE. See PHOSPHURET.

PHOSPHITE. *Syn.* PHOSPHIS, L. A salt of phosphorous acid. See PHOSPHOROUS ACID.

PHOSPHORUS. P.

Prep. This is now only conducted on the large scale:—Bone-ash (in powder), 12 parts, and water 24 parts, are stirred together in a large tub until the mixture is reduced to a perfectly smooth 'pap'; oil of vitriol, 8 parts, is then added in a slender stream, active stirring being employed during the whole time, and afterwards until the combination appears complete; the next day the mass is thinned with cold water, and, if convenient, heated in a leaden pan or boiler until it has entirely lost its granular character; it is now transferred to one or a series of tall casks (according to the extent of the batch), and further diluted with a large quantity of water; after repose, the clear liquid is decanted, the sediment washed with water, and the 'washings' and 'decanted liquor' evaporated in a leaden or copper boiler until the white calcareous deposit (gypsum) becomes considerable; the whole is then allowed to cool, the clear portion decanted, and the sediment thoroughly drained on a filter; the liquid thus obtained is evaporated in an iron pot to the consistence of a thick syrup (say 4 parts), when dry charcoal (in powder), 1 part, is added, and the desiccation continued until the bottom of the pot becomes nearly red hot, after which it is covered over and allowed to cool; the dry mixture, when cold, is put into one or more earthen retorts well covered with 'lutings' and properly dried, and heat is applied (sideways rather than at the bottom) by means of a good air-furnace; after a short time the beak of the retort is connected with a copper tube, the other end of which is made to dip about one fourth of an inch beneath the surface of some lukewarm water placed in a trough or wide-mouthed bottle.

The distilled product is purified by squeezing it through chamois leather under warm water, and is then moulded for sale by melting it under water heated to about 145° Fahr., and sucking it up to any desired height in slightly tapering, but perfectly straight, glass tubes, previously warmed and wetted. The bottom of the tube being now closed with the finger,

it is withdrawn, and transferred to a pan of cold water to congeal the phosphorus, which will then commonly fall out, or may be easily expelled by pressure with a piece of wire.

Prop., &c. Phosphorus, in its normal condition, is a pale yellow, semi-transparent, and highly combustible solid; soft and flexible at common temperatures; it becomes waxy at about 75° Fahr.; melts at about 111° and boils at 550° Fahr.; it takes fire in the air at 165°, and oxidates at all temperatures above 32°. Exposed to the air below 60°, its surface is slowly converted into phosphorous acid. It is apparently insoluble in water, but it conveys its peculiar flavour and odour to that fluid when agitated with it; it is slightly soluble in ether, naphtha, and the fixed and volatile oils, and more freely so in bisulphide of carbon. It unites with oxygen, forming oxides, and with oxygen and hydrogen, forming acids, and with the metals, forming phosphides.

Phosphorus is remarkable for assuming several allotropic forms. In one of these forms (amorphous phosphorus) its properties are so altered that they might be those of a distinct element.

Uses. The principal consumption of phosphorus is in the manufacture of lucifer matches. When swallowed, it acts as a powerful corrosive poison; but small doses of its ethereal and oily solutions are occasionally administered in cases of chronic debility, extreme prostration of the nervous powers, impotency, &c. Its action is that of a powerful diffusible stimulant and diuretic; it is also aphrodisiac. Its use requires great caution, and the effects must be narrowly watched. The treatment of poisoning by phosphorus consists of the administration of a powerful emetic and the copious use of mucilaginous drinks.

Concluding remarks. From the great inflammability of phosphorus it can only be safely preserved under water. In commerce, it is always packed in tin cylinders filled with water, and soldered up air-tight. The leading points to be observed to ensure success in this manufacture are chiefly connected with the firing. The heat of the furnace should be most slowly raised at first, but afterwards equally maintained in a state of bright ignition. After 3 or 4 hours of steady firing, carbonic and sulphurous anhydride are evolved in considerable abundance, provided the materials had not been well dried in the iron pot; then sulphuretted hydrogen makes its appearance, and next phosphuretted hydrogen, which last should continue during the whole of the distillation. The firing should be regulated by the escape of this remarkable gas, which ought to be at the rate of about two bubbles per second. If the discharge comes to be intercepted, it is to be ascribed either to the temperature being too low, or to the retort getting cracked; and if, upon raising the heat sufficiently, no bubbles appear, it is a proof that the apparatus has become defective, and

that it is needless to continue the operation. We may infer that the process approaches its conclusion by the increasing slowness with which the gas is disengaged under a powerful heat; and when it ceases to come over we may cease firing, taking care to prevent reflux of water into the retort (and consequent explosion), from condensation of its gaseous contents, by admitting air into it through a recurved glass tube, or through the tube of the copper adapter. The usual period of the operation, upon the great scale, is from 24 to 30 hours.

Phosphorus, Amorphous. *Syn.* RED PHOSPHORUS, ALLOTROPIC PHOSPHORUS; PHOSPHORUS FUSCUS, P. RUBER. L. This is phosphorus in that peculiar condition to which Berzelius has applied the term "allotropic." The honour of its discovery is due to Dr. Shróetter, of Vienna.

Prep. The ordinary phosphorus of commerce, rendered as dry as possible, is placed in a shallow vessel of hard and well-annealed Bohemian glass, fitted with a safety tube just dipping beneath the surface of a little hot water contained in an adjacent vessel; heat is then applied by means of a metallic bath (a mixture of lead and tin), the temperature of which is gradually raised until it ranges between 464 and 482° Fahr., and bubbles of gas escape from the end of the safety tube and catch fire as they come in contact with the air; this temperature is maintained until the amorphous condition is produced, the length of the exposure being regulated by a miniature operation with tubes conducted in the same bath; as soon as this point is reached, the apparatus is allowed to cool, and the amorphous phosphorus, which still contains some unconverted phosphorus, detached from the glass; it is then reduced to powder by careful trituration under water, drained on a calico filter, and, whilst still moist, spread thinly on shallow trays of iron or lead; in this state it is exposed, with frequent stirring, to heat in a chloride of calcium bath, at first gentle, and then gradually increased to its highest limit, and the heat continued until no more luminous vapour escapes; the residuum on the trays is then cooled, washed with water until this last ceases to affect test paper, and is, lastly, drained and dried. To render it absolutely free from unaltered phosphorus, it may be washed with bisulphide of carbon.

On the small scale, common phosphorus may be converted into amorphous phosphorus by simply exposing it for 50 or 60 hours to a temperature of about 473° Fahr., in any suitable vessel from which the air is kept excluded by a stream of carbonic acid, or any other gas which is unable to act chemically on the phosphorus.

By keeping common phosphorus fused at a high temperature, under the above conditions, for fully 8 days, compact masses of amorphous phosphorus may be obtained.

Prop., &c. A reddish-brown, infusible, inodorous, solid substance, which is reconverted into ordinary phosphorus by simply exposing it to a heat a little above 500° Fahr. It is unaltered by atmospheric air; is insoluble in bisulphide of carbon, alcohol, ether, or naphtha; is non-luminous in the dark below about 390° Fahr.; and does not take fire at a lower temperature than that necessary for its reversion into the common or crystalline form. The sp. gr. ranges between 2.089 to 2.017, according to the method of preparing it. Its properties render it an admirable substitute for the common phosphorus in the composition for tipping matches, both as regards security from spontaneous ignition and the health of the manufacturers; but the anticipations that it would be thus generally applied, owing to its high price, have not yet been realised.

Phosphorus, Trichloride of. PCl_3 . *Syn.* PHOSPHOROUS TRICHLORIDE, PHOSPHOROUS CHLORIDE. By gently heating phosphorus, in excess, in dry chlorine gas; or by passing the vapour of phosphorus through a stratum of powdered mercuric chloride, strongly heated in a glass tube. It is limpid, colourless, highly fetid, fumes in the air, and is slowly resolved by water into phosphorous acid and hydrochloric acid. Sp. gr. 1.45.

Phosphorus, Pentachloride of. PCl_5 . *Syn.* PHOSPHORIC CHLORIDE, PERCHLORIDE OF PHOSPHORUS.

Prep. By the spontaneous combustion of phosphorus in an excess of dry chlorine; or by passing a stream of dry chlorine into the liquid trichloride. By the first method it is obtained as a white crystalline sublimate; by the second, as a solid crystalline mass. It is volatile; water resolves it in phosphoric acid and hydrochloric acid.

Phosphorus, Oxychloride of. PCl_3O . *Syn.* PHOSPHORIC OXYCHLORIDE, PHOSPHORIC MONOOXYCHLORIDE.

Prep. By heating pentachloride of phosphorus with a quantity of water insufficient to convert it into phosphoric acid. It is a colourless, fuming liquid, having the sp. gr. 1.7.

Phosphorus, Hydride of. PH_3 . *Syn.* PHOSPHORETTED HYDROGEN, PHOSPHURETTED HYDROGEN.

Prep. 1. Phosphorous acid is gently heated in a retort, and the first portion of the gas collected.

2. From phosphorus (in small lumps) boiled in a solution of hydrate of potassium or milk of lime, contained in a small retort, as before. Take a very small thin retort, capable of holding not more than 1 oz. or $1\frac{1}{4}$ oz. of water; place in this 3 or 4 fragments of the sticks of fused hydrate of potassium, each being about $\frac{1}{2}$ inch in length; add as much water as will barely cover them, and then drop in a small fragment of phosphorus, about the size of a horse-bean; apply a very gentle heat with the small flame of a spirit lamp, agitating the

the retort continually. A pale ^{br} and astrin- will first appear in the interior, boiled with a reaches the orifice, and burns in hydrochloric the retort should be placed on ^e sugar and its beak about an inch under must be taken not to withdraw ^s to salicin. the lamp. When the bubbles of the ^e Dose. to the surface they spontaneously inflame.

3. From phosphide of calcium and dilute hydrochloric acid, as above; or simply from the phosphide thrown into water.

Obs. The gas obtained by methods 2 and 3 is contaminated with the vapour of a liquid phosphide of hydrogen, PH_3 , which gives to it the property of spontaneous inflammability.

Prop., &c. Colourless; very fetid; slightly soluble in water; burns with a white flame; decomposed by light, heat, and strong acids; as commonly prepared, inflames on contact with air, at ordinary temperatures, but when pure, only at the heat of boiling water. Sp. gr. 1.24. It is rendered quite dry by standing over fused chloride of calcium.

Phosphorus, Suboxide of. P_2O . (Odling.) A reddish-brown powder, formed when a stream of oxygen is forced upon phosphorus, melted beneath the surface of hot water. To purify it from phosphoric acid and free phosphorus, it is washed on a filter with water, then dried by bibulous paper, and finally digested with bisulphide of carbon.

Hypophosphorous Acid. H_3PO_3 . By cautiously decomposing a solution of hypophosphite of barium with sulphuric acid, filtering from the precipitate (sulphate of baryta), and evaporating. Dissolve hypophosphite of calcium, 480 grs. in distilled water, 6 fl. oz.; dissolve crystallised oxalic acid, 350 grs., in another portion of distilled water, 3 fl. oz.; mix the solutions and filter the mixture through white filtering paper. Add distilled water carefully to the filtrate till it measures 10 fl. oz., and evaporate this to $8\frac{1}{2}$ fl. oz. The solution thus prepared contains about 10% of terhydrated hypophosphorous acid.

Prop. A viscid, uncrystallisable liquid having a strongly acid reaction. It is a powerful drying agent, and forms salts called hypophosphites.

Ammonium, Hypophosphite of. $(\text{NH}_4)_3\text{PO}_3$. *Prep.* Dissolve hypophosphite of calcium, 6 oz., in water, 4 pints; and dissolve translucent sesquicarbonate of ammonium, 7.23 oz. (barely $7\frac{1}{4}$), in water, 2 pints; mix the solutions; filter, washing out the solution retained by the carbonate of lime with water, q. s.; evaporate the filtrate to dryness with great care; dissolve it in alcohol, q. s.; filter, evaporate, and crystallise. Very soluble in both alcohol and water.

Barium, Hyperphosphite of. $\text{Ba}_2(\text{PO}_3)_4$. *Prep.* Boil phosphorus in a solution of hydrate of barium (baryta water) till all the phosphorus disappears and the vapours have no longer a garlic odour. Filter, evaporate, and set aside to crystallise.

Calcium, Hypophosphite of. $\text{Ca}_3(\text{PO}_2)_2$.

Prep. Slack recently burned lime, 4 lbs., with water, 1 gall., and mix it with water, 4 galls., just brought to the boiling temperature in a deep open boiler, stirring until a uniform milk of lime is formed; then add phosphorus, 1 lb., and keep up the boiling constantly, adding hot water from time to time, so as to preserve the measure as nearly as may be until all the phosphorus is oxidised and combined, and the strong odour of the gas has disappeared; then filter the solution through muslin, wash out that portion retained by the calcareous residue with water, and evaporate the filtrate till reduced to 6 pints; re-filter, to remove a portion of carbonate of calcium resulting from the action of the air upon the solution; evaporate again until a pellicle forms, and set aside to crystallise—or continue the heat with constant stirring until the salt granulates.

Obs. As spontaneously inflammable phosphorated hydrogen is given off during the boiling, the process must be conducted under a hood, with a strong draught or in the open air. Smaller proportions than those given may be used.

Prop. Hypophosphite of calcium is a white salt, with pearly lustre, crystallising in flattened prisms; soluble in 6 parts of cold water, and slightly soluble in dilute alcohol. It is the most important of these compounds, and when introduced into the stomach it is supposed to be converted into phosphate of calcium. It has been termed 'chemical food.' By decomposition it readily furnishes the other hypophosphites.

Ferric, Hypophosphite of. FePO_2 . *Prep.* By precipitating a solution of hypophosphite of sodium or ammonium, with solution of ferric sulphate, washing the gelatinous precipitate with care (it being somewhat soluble); and, finally, drying it into an amorphous white powder. This is freely soluble in hydrochloric and hypophosphorous acids.

Potassium, Hypophosphite of. K_3PO_2 . *Prep.* From hypophosphite of calcium, 6 oz., dissolved in water, 4 pints; and granulated carbonate of potassium, 5½ oz., dissolved in water, ½ pint. Mix, filter, and wash the precipitate till the filtrate measures 5 pints. Evaporate till a pellicle forms, then stir constantly, continuing the heat till the salt granulates. A white, opaque, deliquescent body, very soluble in water and alcohol.

Quinine, Hypophosphite of. Dissolve sulphate of quinine, 1 oz., in water, by the aid of diluted sulphuric acid; precipitate the alkalioid with ammonia; wash the precipitated quinine and digest it in hypophosphorous acid with heat (the quinine being in excess); after filtering the solution, allow it to evaporate spontaneously till the required salt crystallises. It forms elegant tufts of soft, feathery crystals, which are soluble in 60 parts water.

Sodium, Hypophosphite of. Na_3PO_2 . *Prep.*

From hypophosphite of calcium, 6 oz., dissolved in water, 4 pints; and crystallised carbonate of sodium, 10 oz., dissolved in water, 1½ pint. Proceed as in making hypophosphite of potassium, but allowing 6 pints as the measure of the filtrate. If required in crystals, the granulated salt may be dissolved in alcohol sp. gr. .835, evaporated till syrupy, and set by in a warm place. Crystallises in rectangular tables, with a pearly lustre; is very soluble in water and ordinary alcohol, and deliquesces when exposed to the air.

Phosphorus, Trioxide of. P_2O_3 . *Syn.* PHOSPHOROUS ANHYDRIDE; ANHYDROUS PHOSPHORIC ACID.

Prep. By burning phosphorus in a limited supply of air. White flaky powder, with an odour of garlic, and rapidly absorbing water to form phosphorous acid.

Phosphorous Acid. H_3PO_3 . *Syn.* HYDRATED PHOSPHOROUS ACID. Pure phosphorus is volatilised through a layer of powdered mercuric chloride, contained in a glass tube; terchloride of phosphorus comes over, which, on being mixed with water, is resolved into hydrochloric acid and phosphorous acid; by evaporating the mixed liquid to the consistence of a syrup, the first is expelled, and the residuum forms a crystalline mass of hydrated phosphorous acid on cooling.

Prop., &c. It is a powerful deoxidising agent. Heated in a closed vessel, it is resolved into hydrated phosphoric acid and pure phosphorated hydrogen gas. With the bases it forms salts, called phosphites, which possess little practical importance.

Phosphorous Pentoxide Acid. P_2O_5 . *Syn.* ANHYDROUS PHOSPHORIC ACID; PHOSPHOROUS ANHYDRIDE; PHOSPHORIC OXIDE. By the vivid combustion of phosphorus in a stream of dry atmospheric air, or under a bell-jar, copiously supplied with dry air. The product is pure anhydrous phosphoric acid under the form of snow-like flakes. It must be immediately collected and put into a warm, dry, well-stoppered bottle. In this state it exhibits an intense attraction for water, and when thrown into it combines with explosive violence; exposed to moist air for only a few seconds, it deliquesces to a syrupy-looking liquid.

Phosphoric Acid. There are three distinct acids usually grouped under this head, namely, METAPHOSPHORIC ACID, HPO_3 ; PYROPHOSPHORIC ACID, $\text{H}_4\text{P}_2\text{O}_7$; and PHOSPHORIC ACID, H_3PO_4 .

Metaphosphoric Acid. HPO_4 . *Syn.* MONOBASIC PHOSPHORIC ACID; GLACIAL PHOSPHORIC ACID.

Prep. Bones (calcined to whiteness and powdered), 3 parts, are digested for several days in oil of vitriol, 2 parts, previously diluted with water, 6 parts, the mixture being frequently stirred during the time; a large quantity of water is next added, the whole thrown in a strainer, and the residual matter washed with some hot water; the mixed liquors are

then precipitated with a solution of carbonate of ammonium, in slight excess, filtered from the insoluble, finally ignited in a platinum crucible.

By acting upon the anhydride with cold water.

When phosphoric acid is added to a strong solution of phosphate of zirconium, and the mixture, after concentration, is exposed to a low temperature, prismatic crystals are deposited. These, after being strongly heated to expel their basic water, are pure metaphosphoric acid of sodium. From the solution of this salt in cold water, a solution of pure metaphosphoric acid may be obtained, as above, by means of nitrate or acetate of lead and sulphuretted hydrogen.

Obs. This acid precipitates the salts of silver white, and is distinguished from the other modifications of phosphoric acid by the property which its solution possesses of coagulating albumen.

Pyrophosphoric Acid. $H_4P_2O_7$. *Syn.* **DIBASIC PHOSPHORIC ACID.** By strongly heating common or phosphate of sodium. The water of crystallisation only is at first expelled, and the salt becomes anhydrous; but as the temperature reaches that of redness the salt loses water and is decomposed. By solution of the altered salt in water, crystals of pyrophosphate of sodium may be obtained. A solution of this last compound, treated with nitrate of lead, and the resulting precipitate, suspended in cold water, and decomposed by sulphuretted hydrogen, yields a solution of pure pyrophosphoric acid.

Obs. Heat resolves this into a solution of the ordinary acid. Pyrophosphoric acid precipitates the salts of silver of a white colour. The salts of this acid are called pyrophosphates.

Phosphoric Acid. H_3PO_4 . *Syn.* **TRIHYDRIC PHOSPHATE, TRIBASIC PHOSPHORIC ACID, ORTHOPHOSPHORIC ACID.** Ordinary nitric acid is heated in a tubulated retort connected with a receiver, and small fragments of phosphorus are dropped into it, singly and at intervals; as soon as the oxygenation of the phosphorus is complete, the heat is increased, the undecomposed acid distilled off, and the residuum evaporated to the consistence of a syrup. In this state it forms the phosphoric acid of the shops. Commercial phosphate of sodium is dissolved in water and the solution precipitated with another of acetate of lead; an abundant white precipitate (phosphate of lead) falls; this is collected on a filter, well washed, and, whilst still moist, is suspended in distilled water, and sulphuretted hydrogen gas passed into it, in excess; a black insoluble precipitate forms, while pure tribasic phosphoric acid remains in solution, and is easily deprived of the residual sulphuretted hydrogen by a gentle heat. By concentration in vacuo over sulphuric acid, it may be obtained in thin crystalline plates.

The solution of this acid may be boiled without change, but when concentrated and heated to about 400° Fahr. it is converted

into pyrophosphoric acid, and at a red heat into metaphosphoric acid. Its salts are the ordinary phosphates, or nitrophosphates, and they give a yellow precipitate with nitrate of silver.

Tests. The following reactions characterise the ordinary or other phosphates:—1. Chloride of barium produces in aqueous solutions of the neutral and basic phosphates a white precipitate, which is insoluble in either hydrochloric or nitric acid, and with difficulty soluble in a solution of chloride of ammonium.—2. Solution of sulphate of calcium produces in neutral and alkaline solutions of the phosphates a white precipitate, freely soluble in acids, even the acetic.—3. Sulphate of magnesium produces in solutions of the phosphates, to which some chloride of ammonium and free ammonia has been added, a white, crystalline, and quickly subsiding precipitate of the phosphate of ammonium and magnesium, which is insoluble in a solution of either ammonia or chloride of ammonium, but readily soluble in acids, even the acetic.—4. Nitrate of silver, with neutral and basic alkaline phosphates, gives a light yellow precipitate. If the fluid in which the precipitate is suspended contained a basic phosphate, it does not affect test paper; if it contained a neutral phosphate, the reaction will be acid. If the phosphate examined has been heated to redness before solution, it then, as a metaphosphate, gives a white precipitate with nitrate of silver.—5. Hydrochloric acid is added to the solution to acid reaction, and afterwards 1 or 2 drops of a concentrated solution of ferric chloride; a solution of acetate of potassium is next added in excess, when a flocculent, gelatinous, white precipitate will be formed if phosphoric acid or any phosphate was present in any form or combination in the original liquor. This test is highly characteristic, and of general applicability.—*Obs.* The insoluble phosphates must be first treated with diluted hydrochloric or sulphuric acid, and the resulting solution filtered and neutralised with an alkali, before applying the reagents. When the substance under examination consists of a very small quantity of phosphoric acid or phosphate, with a large quantity of sesquioxide of iron, it should be fused with some carbonate of sodium, the residuum of the ignition exhausted with water, and the tests applied to the filtered solution. Arsenious acid, if present, should be removed by sulphuretted hydrogen before applying the tests. When phosphate of aluminum, the solution in hydrochloric acid is neutralised with carbonate of sodium; carbonate of barium is next added in excess, followed by the addition of hydrate potassium, also in excess, after which the whole is boiled. An insoluble phosphate of barium is formed, which may be decompose by sulphuric acid, as before. See **MOLYBDATE OF AMMONIUM**.
Estim. Pure solutions or phosphoric acid may be tested by the common methods of

acidimetry. When in a state of combination, it may be separated and weighed in either of the forms noticed under GUANO.

Uses, &c. This acid is the common form, and is the compound alluded to when 'phosphoric acid' is spoken of. It is extensively employed by the bleacher, dyer, calico-printer, and enameller. Unlike sulphuric acid and the other strong acids, it does not coagulate albumen nor injure vegetable fibre, and is not decomposed by contact with organic matter. In combination with alumina and a large boracic acid, it is said to be capable of producing a glaze for earthenware, of extreme beauty and durability, and perfectly innocuous. It is also used in medicine.

PHOSPHORUS, BALDWIN'S. Recently fused nitrate of calcium. For this purpose it must be broken into fragments whilst still warm, and at once placed in dry and well-stopped phials. After exposure for some time to the direct rays of the sun, it emits sufficient light in the dark to render visible the figures on the dial-plate of a watch.

PHOSPHORUS, BOLOGNIAN. *Syn.* KERCHEP'S PHOSPHORUS, BOLOGNIAN STONE. This substance was accidentally discovered by a shoemaker of Bologna, and excited much interest about the middle of the 17th century. The following is said to have been the formula employed by the Logani family, who were particularly successful in its preparation, and acquired wealth by its sale to the curious throughout Europe.

Prep. Reduce recently calcined native sulphate of barium to powder, make it into a paste with mucilage of gum tragacanth, and roll the mass into pieces about $\frac{1}{4}$ inch thick and 1 to 2 inches long; dry these slowly by a moderate heat, and then expose them to ignition in a wind furnace, by placing them loosely among the charcoal; lastly, allow them to cool slowly, and at once place the pieces in well-stopped phials. Like the preceding substance, it phosphoresces in the dark after exposure to the sun's rays.

PHOSPHORUS, CANTON'S. *Prep.* From calcined oyster shells, 3 parts; flowers of sulphur, 1 part; placed in alternate layers in a covered crucible, and exposed to a strong heat for about an hour. It is preserved and used like the above.

PHOSPHORUS, HOMBERG'S. Recently ignited chloride of calcium.

PHOSPHORUS BOTTLES. *Prep.* 1. Phosphorus, 12 grs.; olive oil, $\frac{1}{2}$ oz.; mix in an oz. phial, and place the latter, loosely corked, in a basin of hot water; as soon as the phosphorus is melted, remove the phial, cork it securely, and agitate it until nearly cold. On being uncorked, it emits sufficient light in the dark to see the time by a watch, and will retain this property for some years if not too frequently employed. These are frequently called 'luminous phials.'

2. (BRIQUETS PHOSPHORIQUES).—*a.* From

phosphorus, 3 parts; white wax, 1 part; cautiously melted together by the heat of hot water; as the mixture begins to cool, the bottles are turned round, so that it may adhere to the sides.

6. (Bendix.) Cork (rasped small, and dry) and yellow wax, of each, 1 part; phosphorus, 4 parts; petroleum, 8 parts; mixed, by fusion, as the last.

Used as instantaneous-light bottles. A sulphur match rubbed against the composition immediately inflames on exposure to the air. They should be only unstopped at the instant of introducing the match, and should be handled with caution.

PHOSPHORUS MATCHES. See MATCHES, and above.

PHOSPHORUS PASTE. *Syn.* ANTI-ARSENICAL RAT-POISON, PHOSPHOR-PASTE. *Prep.*

1. Phosphorus, 1 oz.; warm water, 1 pint; place them in a bottle, cork it, and agitate them well together, until the phosphorus is reduced to a minute state of division, adding towards the end moist sugar, $\frac{1}{2}$ lb.; next add of lard (melted by a gentle heat), 1 lb., and repeat the agitation until the whole is nearly cold; when cold, form it into a stiff dough with oatmeal or barley meal, and make this into small balls or cakes; lastly, dry these in the air, without artificial heat.

2. (Simon.) Phosphorus, 8 parts; water (lukewarm), 180 parts; mix in a mortar, and add of rye meal, 180 parts; when cold, further add of butter or lard, 180 parts; sugar, 125 parts; and mix the whole thoroughly together. This is the formula authorised by an ordonnance of the Prussian Government, dated April 27th, 1843.

Obs. Rats, mice, &c., eat the above composition with avidity, after which they soon die. It is said that the best method of using it is to place small pieces of it in and about the holes, with some water in a shallow vessel for them to drink. It has the advantage of retaining its efficacy for many years, and is less dangerous to human beings than compositions containing arsenic, whilst it is even more effective for the purpose for which it is employed. Some persons recommend the addition of a little oil of rhodium or oil of aniseed. See RATS, &c.

PHOSPHURET. *Syn.* PHOSPHIDE; PHOSPHURETUM, PHOSPHIDUM, L. A compound of phosphorus with a metal or other basic radical. See the respective METALS, &c.

PHOSPHURETTED HYDROGEN. *Syn.* PHOSPHORETTED HYDROGEN. See HYDROGEN.

PHOTOGRAPHY. *Syn.* HELIOGRAPHY. The art of producing images on prepared surfaces by means of the actinic or chemical rays of the sun's light. The principal photographic processes now in use are the positive, negative, and dry-collodion processes, in each of which a thin film or skin of iodised collodion forms the sensitive surface, a plate of glass being generally used as the foundation of the film

In a positive picture the 'lights' are silvery white by reflected light, and the 'shades' are produced by a 'backing' of black varnish or velvet, showing through the glass plate. In a negative picture the 'lights' are of a dirty yellow or brown by reflection, and being formed by opaque deposits, appear dense black by transmitted light. Negatives are used in the various paper-printing processes; they are placed upon-prepared paper and exposed to direct light, which darkens those parts of the paper not protected by the opaque 'lights,' and thus produces positive prints with natural lights and shades. In this way the portrait 'cartes de visite' and other paper photographs are formed. The advantages of the 'dry-collodion process' are, that the plates, when 'sensitised,' will keep for any length of time, and may be 'developed' several days after taking the picture. The principal paper processes are the Talbotype, or calotype, invented in 1839 by Mr. Fox Talbot; the ordinary albumen process, in which pure white of egg is used to give a glossy surface to the paper; and the waxed paper process, in which the paper is waxed before being sensitised. The Daguerreotype process, discovered by M. Daguerre in 1839, has been almost entirely superseded by the easier, healthier, and less expensive collodion process. It consists in submitting a plate of silver or silvered copper to the vapour of iodine and bromine in the dark. A sensitive film of iodide and bromide of silver is thus formed on the plate, which is immediately exposed to the image of an object in the camera obscura. The latent image impressed on the plate is brought out or developed by exposing the plate to the action of the vapour of mercury.

The art of photography cannot be adequately expounded in a work like the present, and we must refer our readers for practical directions to one of the many special treatises on the subject which have been written. The work which contains the greatest amount of information within a moderate compass is Jabez Hughes's 'Principles and Practice of Photography' (Simpkin, Marshall, and Co.), of which no fewer than nine editions have been issued. Besides this excellent little guide to manipulation, the 'Year Book of Photography,' edited for many years past by Geo. Wharton Simpson, M.A. (Piper and Carter), takes cognisance of all the latest improvements introduced into the practice of the art, and furnishes details in the form of an annual report. See CAMERA OBSCURA, COLLODION, &c.

PHOTOMETRY. The art of determining the relative intensities of different lights. Various methods have been adopted, at different times, for this purpose, among which, however, a few only are sufficiently simple for general application. The principle adopted by Bouguer and Lambert depends on the fact that, though the eye cannot judge correctly of

the proportional force of different lights, it can, generally, distinguish with great precision when two similar surfaces or objects presented together are equally illuminated, or when the shadows of an opaque object produced by different lights are equally dark. Now, as light travels in straight lines, and is equally diffused, it is evident that its intensity will progressively lessen as the distance of its source increases. This diminution is found to be in the duplicate ratio of the distance. To apply this principle to candles, lamps, gas-lights, &c., we have only to arrange two of them so that the light or shadow resulting from both shall be of equal intensity, after which we must carefully measure the distance of each of them from the surface on which the light or shadow falls. The squares of these distances give their relative intensity. In general, some known light, as that from a wax candle (4 to the lb.), is taken as the standard of comparison.

Dr. Ritchie's 'photometer' consists of a rectangular box, about 2 inches square, open at both ends, and blackened inside to absorb extraneous light. In this, inclined at angles of 45° to its axis, are placed two precisely similar rectangular plates of plain silvered glass, and fastened so as to meet at the top, in the middle of a narrow slit about an inch long and the eighth of an inch broad, and which is covered with a strip of tissue or oiled paper. In employing this instrument, "lights must be placed at such a distance as each other, and from the instrument being them, that the light from each shall fall on the reflector next it, and be reflected to the corresponding portion of the oiled paper. The photometer is then to be moved nearer to the one or the other, until the two portions of the oiled paper corresponding to the two mirrors are equally illuminated, of which the eye can judge with considerable accuracy."

In Prof. Wheatstone's 'PHOTOMETEE' the relative intensity of the two lights is determined by the relative brightness of the opposite sides of a revolving silvered ball illuminated by them.

In the method of photometry usually, but erroneously, ascribed to Count Rumford, the shadows of an opaque object formed by different lights, and allowed to fall on a white wall or paper screen, are contrasted. A wire about $\frac{1}{8}$ ths of an inch thick, and about a foot in length, with the one end bent so as to form a handle, is commonly used to form the shadows. The method of proceeding is similar to that first above noticed.

It is generally supposed that the equality of two shadows can be appreciated with greater certainty than that of two lights.

PHTHISIS. A popular name for difficulty of breathing, from its supposed resemblance to phthisis. See BRONCHITIS, and below.

PHYSIC BALLS. See VETERINARY MEDICINES.

PICA. Depraved appetite. (See page 128.)

PIC'AMAR. One of the peculiar principles discovered by Reichenbach in beech-tar, and described by him as a viscid, colourless, oily liquid, only feebly odorous, but intensely bitter; insoluble in water; freely soluble in alcohol, ether, and oils; boiling-point 520° Fahr.; sp. gr. 1.095. See KREASOTE.

PICCALIL'LI. See PICKLES.

PICK'LE. The liquor in which substances used as food are preserved. That for flesh is commonly brine; that for vegetables, vinegar; both of which are commonly flavoured with spices, &c.

Prep. 1. (FOR MEAT.)—*a.* From bay salt, 3 lbs.; saltpetre, 2½ oz.; moist sugar, 1 lb.; allspice and black pepper, of each (bruised), 1 oz.; water, 9 pints; simmer them together in a clean covered iron or enamelled vessel for 7 or 8 minutes; when the whole has cooled, remove the scum, and pour it over the articles to be preserved. Used for hams, tongues, beef, &c., to which it imparts a fine red colour and a superior flavour.

b. From bay salt and common salt, of each, 2 lbs.; moist sugar, 1 lb.; saltpetre, ¼ lb.; allspice (bruised), ½ oz.; water, 1 gal.; as before. Used chiefly for pork and hams. Common salt may be substituted for bay salt, but it is less powerfully antiseptic, and the flavour is less grateful.

2. (FOR VEGETABLES.)—*a.* Strong distilled vinegar, to each quart of which 1½ oz. of good salt has been added.

b. Good distilled vinegar, 4 pints; common salt, 2½ oz.; black pepper, ½ oz.; unbleached Jamaica ginger, 2½ oz.; (the last two bruised, but not dusty;) mace (shredded), ¼ oz.; simmer in an enamelled iron or stoneware vessel, as above, and strain through flannel. Sometimes a little capsicum is added. Used either hot or cold, according to the vegetable it is intended to preserve.

Pickle, Lemon. See SAUCES.

PICKLES. These well-known articles are easily prepared of the finest quality. The vegetables and fruit, selected of the proper quality and at the proper season, after being well cleansed with cold spring water, are steeped for some time in strong brine; they are then drained and dried, and transferred to bottles or jars; the spice (if any) is then added, the bottles filled up with hot, strong, pickling vinegar, and at once securely corked down and tied over with bladder. As soon as the bottles are cold, the corks are dipped into melted wax, the more surely to preserve them air-tight. Good wood or distilled vinegar is commonly used for this purpose; but the best malt or white wine vinegar of the strength known as No. 22 or 24 is exclusively employed for the finer pickles which are not spiced. In those for early use the 'steep' may be made in hot or boiling brine, by which the product will be ready for the table in a much shorter

period; but with substances of a succulent and flabby nature, as cabbage, cauliflower, some fruit, &c., or in which crispness is esteemed a mark of excellence, this is inadmissible. To such articles the vinegar should also be added cold, or, at furthest, should be only slightly warmed. As a general rule, the softer and more delicate articles do not require so long soaking in brine as the harder and coarser kinds; and they may be often advantageously pickled by simply pouring very strong pickling vinegar over them, without applying heat. It must also be observed that beetroot, and other like substances which are sliced, as well as certain delicate fruits, must not be steeped at all. The spice is commonly added whole to the bottles; but a more economical plan is to steep it (bruised) for some time, or to simmer it in the vinegar before using the latter, as in the forms given under PICKLE (*above*).

The spices and flavouring ingredients employed for pickles are—allspice, black and white pepper, capsicums or red pods, cloves, garlic, ginger, horseradish, lemon peel, mace, mustard, shallots, and turmeric. These are chosen with reference to the particular variety of the pickle, or the taste of the consumer.

In the preparation of pickles it is highly necessary to avoid the use of metallic vessels, as both vinegar and brine rapidly corrode brass, copper, lead, &c., and thus become poisonous (see page 367). These liquids may be best heated or boiled in a stoneware jar by the heat of a water bath or a stove. Common glazed earthenware should be avoided, either for making or keeping the pickles in, as the glazing usually contains lead. Pickles should also be kept from the air as much as possible, and should only be touched with wooden or bone spoons. They are also better prepared in small jars, or bottles, than in large ones, as the more frequent opening of the latter exposes them too much. Copper or verdigris is frequently added to pickles to impart a green colour, or the vinegar is boiled in a copper vessel until sufficiently 'greened' before pouring it on the vegetables. This poisonous addition may be readily detected by any of the tests mentioned at page 367. If a green colour be desired, it may be imparted to the vinegar, and ultimately to the pickles, by steeping vine leaves, or the leaves of parsley or spinach, in it. A teaspoonful of olive oil may be advantageously added to each bottle, to keep the pickles white, and to promote their preservation.

. The following list includes the leading pickles of the shops, and some others:—

Barbarries. From the ripe fruit, without heat.

Beans. From the young green pods of the scarlet bean, and the French or kidney bean, with heat.

Beetroot. From the sliced root, without steeping in brine, and with cold spiced vinegar.

When wanted for immediate use, the vinegar may be used boiling hot,

Brocoli. As CAULIFLOWERS.

Cabbage. This, either red or white, is cut into thin slices, and steeped in strong brine or sprinkled with common salt, and allowed to lie for 1 or 2 days; after which it is drained for 10 or 12 hours in a warm room, and then put into jars or bottles, with or without a little mace and white peppercorns, and at once covered with cold, strong, white vinegar.—Another plan is to steep the sliced cabbage in alum water for 10 or 12 hours, and, after draining and drying it, to pour the vinegar upon it as before. The product of the last formula eats very fresh and crisp, but takes longer to mature than that of the other. Some persons add a little salt with the vinegar; and others mix slices of red beet with the cabbage.

Capsicums. As GHERKINS.

Cauliflowers. As CABBAGE (nearly). Or, they may be steeped in hot brine for 1 or 2 hours before pouring the vinegar over them.

Cherries. From the scarcely ripe fruit, bottled, and covered with strong and colourless pickling vinegar.

Codlins. As BEANS.

Cucumbers. As GHERKINS.

Elderflowers. From the clusters, just before they open, as RED CABBAGE. A beautiful pickle.

English Bamboo. From the young shoots of elder, denuded of the outer skin, pickled in brine for 12 or 14 hours; then bottled with a little white pepper, ginger, mace, and allspice, and pickled with boiling vinegar. Excellent with boiled mutton.

Eschalots. With boiling spiced vinegar, or spices added to each bottle.

French Beans. See *above*.

Garlic. As ESCHALOTS.

Gherkins. From small cucumbers (not too young), steeped for a week in very strong brine; this last is then poured off, heated to the boiling-point, and again poured on the fruit; the next day the gherkins are drained on a sieve, wiped dry, put into bottles or jars with some spice (ginger, pepper, or cayenne), and at once covered with strong pickling vinegar, boiling hot. Several other pickles may be prepared in the same way.

Gooseberries. From the green fruit, as either CABBAGE or CAULIFLOWERS.

Indian Mango. From green peaches. (See *below*.)

Indian Pickle. *Syn.* PICCALILLI. This is a mixed pickle which is characterised by being highly flavoured with curry-powder, or turmeric, mustard, and garlic. The following form is commonly used:—Take 1 hard white cabbage (sliced), 2 cauliflowers (pulled to pieces, some French beans, 1 stick of horseradish (sliced), about 2 dozen small white onions, and 1 dozen gherkins; cover them with boiling brine; the next day drain the whole

on a sieve, put into a jar, and add, of curry-powder or turmeric, 2 oz.; garlic, ginger, and mustard seed, of each, 1 oz.; capsicums, $\frac{1}{2}$ oz.; fill up the vessel with hot pickling vinegar, bung it up close, and let it stand for a month, with occasional agitation. See MIXED PICKLES (*below*).

Lemons. From the fruit, slit half way down into quarters, and cored, put into a dish, and sprinkled with a little salt; in about a week, the whole is placed in jars or bottles with a little turmeric and capsicums, and covered with hot vinegar.

Limes. As the last.

Mangoes. As LEMONS, adding mustard-seed and a little garlic, with spices at will. ENGLISH MANGOES are made from cucumbers or small melons, split and deprived of their seeds.

Melons. As LEMONS (nearly).

Mixed Pickles. From white cabbage, cauliflowers, French beans, cucumbers, onions, or any other of the ordinary pickling vegetables, at will (except red cabbage or walnuts) treated as GHERKINS; with raw ginger, capsicum, mustard seed, and long pepper, for spice, added to each bottle. A little coarsely bruised turmeric improves both the colour and flavour.

Mushrooms. From the small button mushrooms, cleansed with cold spring water, and gently wiped dry with a towel, then placed in bottles, with a blade or two of mace, and covered with the strongest white pickling vinegar, boiling hot.

Myrobalans. The yellow myrobalan preserved in strong brine. Gently aperient.

Nasturtiums. From the unripe or scarcely ripe fruit, simply covered with cold strong vinegar; or, as CABBAGE or GHERKINS.

Onions. From the small button or filbert onion, deprived of the outer coloured skin, and either at once put into bottles and covered with strong white pickling vinegar, or previously steeped for a day or two in strong brine or alum water. When required for early use, the vinegar should be poured on boiling hot.

Peaches. From the scarcely ripe fruit, as GHERKINS.

Peas. As BEANS or CAULIFLOWERS.

Piccalilli. See INDIAN PICKLE.

Radish Pods. As BEANS or GHERKINS.

Sapphire. From the perennial sapphire (*Erythrum maritimum*), covered with strong vinegar, to each pint of which $\frac{1}{2}$ oz. of salt has been added, and poured on boiling hot. Said to excite the appetite.

Tomatoes. From the common tomato or love apple, as GHERKINS.

Walnuts. From the young fruit of *Juglans regia*, or common walnut:—1. Steep them in strong brine for a week, then bottle them, add spice, and pour on the vinegar boiling hot.

2. On each pint of the nuts, spread on a dish, sprinkle 1 oz. of common salt; expose them to the sun or a full light for 10 or 12

days, frequently basting them with their own liquor; lastly, bottle them, and pour on the vinegar, boiling hot.

3. (Dr. Kitchener.) Gently simmer the fruit in brine, then expose it on a cloth for a day or two, or until it turns black; next put it into bottles or jars, pour hot spiced vinegar over it, and cork down immediately. In this way the pickle becomes sufficiently mature for the table in half the time required for that prepared by the common method. Dr. Kitchener also recommends this parboiling process for several other pickles. Some persons pierce the fruit with an awl or stocking-needle, in several places, in order to induce early maturation. The spices usually employed are mustard-seed, allspice, and ginger, with a little mace and garlic.

PICOLINE. An oily substance, discovered by Dr. Anderson, associated with aniline, chinoline, and some other volatile bases, in certain varieties of coal-tar naphtha.

PICRIC ACID. $\text{HC}_6\text{H}_3(\text{NO}_2)_3\text{O}$. *Syn.* CARBAZOTIC ACID, NITROPHENISIC ACID, TRINITROPHENISIC ACID. A peculiar compound formed by the action of strong nitric acid on indigo, aloes, wool, and several other substances.

Prep. 1. Add, cautiously and gradually, 1 part of powdered indigo to 10 or 12 parts of hot nitric acid of the sp. gr. 1.43; when the reaction has moderated and the scum has fallen, add an additional quantity of nitric acid, and boil the whole until red fumes are no longer evolved; redissolve the crystals of impure picric acid deposited in boiling distilled water, and remove any oily matter found floating on the surface of the solution by means of bibulous paper; a second time redissolve in boiling water the crystals which form as the liquid cools, saturate the new solution with carbonate of potassa, and set it aside to crystallise; the crystals of picrate of potassium thus obtained must be purified by several re-solutions and re-crystallisations, and next decomposed by nitric acid; the crystals deposited as the liquid cools yield pure picric acid by again dissolving them in boiling water, and re-crystallisation.

2. Dissolve the yellow resin of *Xanthorrhoea hastilis* (Botany Bay Gum) in a sufficiency of strong nitric acid. Red vapours are evolved, accompanied by violent frothing, and a deep red solution is produced, which turns yellow after boiling. Evaporate this solution over a water bath. A yellow crystalline mass is deposited, which consists of picric acid with small quantities of oxalic and nitrobenzoic acids. The picric acid is purified by neutralising the yellow mass with potassa, and crystallising twice out of water. The pure picrate of potassium thus obtained is decomposed by hydrochloric acid, and the liberated picric acid is purified by two crystallisations. This process, devised by Stenhouse, is one of the best, and yields a quantity of the acid amounting to 50% of the resin employed.

Prop., &c. Brilliant yellow scales, scarcely soluble in cold water, but very soluble in boiling water, and in alcohol and ether; fusible; volatile; taste, insupportably bitter, and very permanent. It forms salts with the bases (picrates, carbazotates), mostly possessing a yellow colour, and exploding when heated. The picrate of lead has been proposed as a fulminating powder for percussion caps. The picrate of potassium has been given with advantage in intermittent fevers. A solution of picric acid in alcohol is an excellent test for potassa, if there be not too much water present, as it throws down a yellow crystalline precipitate with that alkali, but forms a very soluble salt with soda. Most of the picrates may be made by the direct solution of the carbonate, hydrate, or oxide of the metal, in a solution of the acid in hot water. The picrate of silver forms beautiful starry groups of acicular crystals, having the colour and lustre of gold.

The principal use of crude picric acid is for dyeing yellow. It is said to be largely employed for the adulteration of beer. It is, however, highly poisonous. According to Prof. Rapp, it acts deleteriously both when swallowed and applied to the unsound skin. Five grains seriously affected a large dog, and killed it within 24 hours. It induces vomiting, feebleness, and general loss of nervous tone. The tissues of animals poisoned by it (even the white of the eye) were tinged of a yellow colour. See PORTER, &c.

PICROTOXIN. $\text{C}_{12}\text{H}_{14}\text{O}_5$. *Syn.* PICROTOXINE, PICTROTOXIA, PICROTOXINA. A poisonous principle discovered by Boullay in the fruit of *Anamirta paniculata*, or *Cocculus Indicus*.

Prep. 1. Precipitate a decoction of *cocculus Indicus* with a solution of acetate of lead, gently evaporate to dryness, redissolve the residuum in alcohol of 817, and crystallise by evaporation; repeat the solution and crystallisation a second and a third time. Any adhering colour may be removed by agitating it with a very little water; or by animal charcoal, in the usual manner.

2. (Kane.) Alcoholic extract of *cocculus Indicus* is exhausted with the smallest possible quantity of water, and the mixed liquors filtered; to the filtrate hydrochloric acid is added, and the whole set aside to crystallise. The product may be purified as before.

Prop., &c. It forms small, colourless, stellated needles; soluble in alcohol, ether, and acetic acid, and feebly so in water; boiling water dissolves it freely; taste of solutions, inexpressibly bitter; reaction, neutral. It does not combine with acids, as formerly asserted, but it forms feeble combinations with some of the bases. It is a powerful intoxicant and narcotico-acrid poison. It acts powerfully on the spinal cord and nervous system generally, occasioning an increase of the animal temperature, and peculiar movements, similar to

those described by Flourens as resulting from sections of the cerebellum. It is frequently present in malt liquors, owing to their common adulteration with *cocculus Indicus*.

PIERRE DIVINE. *Syn.* CUPRUM ALUMINATUM. See LAPIS DIVINUS.

PIES. Alexis Soyer gives the following instructions for making pies:—

To make a pie to perfection,—when your paste (half-puff or short) is carefully made, and your dish or form properly full, throw a little flour on your paste-board, take about a $\frac{1}{4}$ lb. of your paste, which roll with your hand until (say) an inch in circumference; then moisten the rim of your pie-dish, and fix the paste equally on it with your thumb. When you have rolled your paste for the covering, or upper crust, of an equal thickness throughout, and in proportion to the contents of your pie ($\frac{1}{2}$ inch is about the average), fold the cover in two, lay it over one half of your pie, and turn the other half over the remaining part; next press it slightly with your thumb round the rim, cut neatly the rim of the paste, form rather a thick edge, and mark this with a knife about every quarter of an inch apart; observing to hold your knife in a slanting direction, which gives it a neat appearance; lastly, make two small holes on the top, and egg-over the whole with a paste-brush, or else use a little milk or water. Any small portion of paste remaining may be shaped to fanciful designs, and placed as ornaments on the top.

“For meat pies, observe that, if your paste is either too thick or too thin, the covering too narrow or too short, and requires pulling one way or the other, to make it fit, your pie is sure to be imperfect, the covering no longer protecting the contents. It is the same with fruit; and if the paste happens to be rather rich, it pulls the rim of the pie to the dish, soddens the paste, makes it heavy, and, therefore, indigestible as well as unpalatable.”

Meat pies require the addition of either cayenne, or black pepper, or allspice; and fruit pies, of enough sugar to sweeten, with mace, ginger, cloves, or lemon peel, according to taste and the substance operated on. See PASTRY, &c.

PIG. The pig or hog (*Sus Scrofa*—Linn.), one of the common pachydermata, is now domesticated in all the temperate climates of the world. Its flesh constitutes pork, bacon, ham, &c.; its fat (lard) is official in the Pharmacopæias. The skin, bristles, and even the blood and intestines of this animal, are either eaten as food or turned to some useful purpose in the arts. See PORK, LEATHER, &c.

PIGMENTS. These are noticed under the respective colours.

PIKE. The *Esox Lucius* (Linn.), a freshwater fish. It is remarkable for its voracity, but is highly esteemed by epicures. Various parts of it were formerly used in medicine. The fat (*OLEUM LUCII PISCIS*) was one of the

simples of the Ph. L. of 1618, and was esteemed as a friction in catarrhs. It is even now used in some parts of Europe to disperse opacities of the cornea.

PIL/CHARD. The *Clupea Pilchardus*, a fish closely resembling the common herring, than which, however, it is smaller, but thicker and rounder and more oily. It abounds on the coasts of Devon and Cornwall, where it is not only consumed as food, but pressed for its oil.

PILES. *Syn.* HEMORRHOIDS; HEMORRHOIDES, L. A painful disease occasioned by the morbid dilatations of the veins at the lower part of the rectum and surrounding the anus.

Piles are principally occasioned by costiveness and cold; and, occasionally, by the use of acrid food. They have been distinguished into—BLIND PILES, or a varicose state of the veins without bleeding,—MUCOUS PILES, when the tumours are excoriated, and mucus or pus is discharged,—BLEEDING PILES, when accompanied with loss of blood, and—EXCRESCENTIAL PILES, when there are loose fleshy excrescences about the verge of the anus and within the rectum.

The treatment of piles consists in the administration of mild aperients, as castor oil, or an electuary of sulphur and cream of tartar. When there is much inflammation or bleeding, cold and astringent lotions, as those of sulphate of zinc or alum, should be applied; and when the pain is considerable, fomentations of decoction of poppy heads may be used with advantage. To arrest the bleeding, ice is also frequently applied, but continued pressure is more certain. When the tumours are large and flaccid, the compound ointment of galls is an excellent application; and if there is a tendency to inflammation, a little liquor of diacetate of lead may be added. In confirmed piles, the internal use of copaiba, or, still better, of the confection of black pepper, should be persevered in for some time, together with local applications. In severe cases the protruded tumours are removed by surgeons, by the knife or ligature. See OINTMENTS, ELECTUARIES, &c.

PILL COCHIA. See COMPOUND COLOCYNTH PILLS (*below*).

PILL RUFI. See PILLS OF ALOES WITH MYRRH (*below*).

PILLS. *Syn.* PILULE (Ph. E. & D.), PILULA (Ph. L.), L.; PILULES, SACCHAROLÆ SOLIDES, Fr. Pills are little balls, of a semi-solid consistence, composed of various medicinal substances, and intended to be taken whole. The facility with which they are made and administered, their comparatively little taste, their power of preserving their properties for a considerable length of time, and, lastly, their portability and inexpensiveness, have long rendered them the most frequently employed and the most popular form of medicine.

The rapid and skilful preparation of pills,

from all the numerous substances of which they are composed, is justly considered to demand the highest qualifications in the practical dispenser. The medicinals employed must be made into a consistent and moderately firm mass, sufficiently plastic to be rolled or moulded into any shape, without adhering to the fingers, knife, or slab, and yet sufficiently solid to retain the globular form when divided into pills. A few substances, as certain extracts, &c., are already in this condition; but the others require the use of an excipient to give them the requisite bulk or consistence. As a general rule, all the constituents of a pill which can be pulverised should be reduced to fine powder, before mixing them with the soft ingredients which enter into its composition; and these last, or the excipient, should next be gradually added, and the mixture triturated and beaten until the whole forms a perfectly homogeneous mass. It is then ready to be divided into pills. This is effected by rolling it on a slab, with a pill or bolus knife, into small pipes or cylinders, then dividing these into pieces of the requisite weight; and, lastly, rolling them between the thumb and finger to give them a globular form. A little powdered liquorice-root or starch is commonly employed to prevent the pills adhering to the fingers, or to each other, after they are made. Magnesia, so frequently used for this purpose, is unsuited for pills containing metallic salts or the alkaloïds, or other remedies, which are exhibited in very small doses.

Instead of forming the mass into pills by hand, in the manner just referred to, a convenient and simple instrument, called a 'pill-machine,' is now generally used by the druggists for the purpose. This consists of two pieces. The first (see fig. 1) is divided into three compartments:—*c* is a vacant space to receive the divided mass, which is to be rolled into pills:—*b* is a grooved brass plate, which assists in dividing the mass into pills; and —*a* is a box for containing the powder for covering the pills, and to receive them as they are formed. The second (see fig. 2) consists of a brass plate (*a*), grooved to match the plate *b* in fig. 1, and bounded at both ends by movable projecting plates (*b b*), containing each two wheels under the ledge of the plate (*b*); and a wooden back (*c*), with two handles, (*d d*), to which this plate is affixed. In using this machine, the pill-mass is rolled into a cylindrical form on the front part of it, by means of fig. 2 inverted; the small roll is then laid on the cutting part of the instrument (*1, b*), and divided by passing fig. 2 over it, the little wheels enabling the latter to run easily on the brass plate which forms the margin of the bed of the machine. The pills, thus formed, are then drawn forward on to the smooth bed on which the mass was first rolled, and receiving a finishing turn or two with the smooth side of the "cutter," by which they are rendered more nearly spherical. They

are, lastly, thrown over into 1, *c*, ready to be transferred to the pill-box.

Fig. 1.

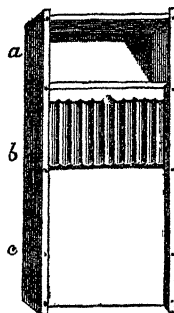

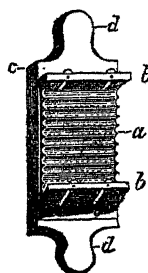

Fig. 2.

The nature of the excipient should be suited to that of the active ingredients in pills, as well as in all other forms of medicine. Soft extracts, and other substances of a like character, may be rendered more consistent by the addition of any simple powder, as that of liquorice or sugar. Vegetable powders are generally beaten up with syrup or treacle, and heavy powders with conserve of roses or extract of liquorice. Castile soap (made of olive oil and soda) and medicinal soft soap (made of olive oil and potash) are commonly employed for fatty and resinous matters, as well as for many others which are not decomposed by alkalies. When the chief ingredient of the mass is resin, rectified spirit is frequently used to soften it, either with or without the addition of soap to increase its solubility in the stomach. For many substances no excipient is required. Thus, most of the gum-resins and stiff extracts may be at once made into pills, or, at all events, after being slightly softened by heat. Mucilage, formerly so much used in the preparation of pills, is now only employed for those which are to be taken within a day or two after being made; as pills containing it become so hard and insoluble when kept for some time, as to resist the action of the stomach, and frequently to pass through the bowels without even losing their form.

It may be further remarked, that no deliquescent salt should enter into the composition of pills not intended for immediate use; and that when efflorescent salts are so employed, they should be first freed from their water of crystallisation.

When the mixed ingredients are made into a mass (pill-mass), which it is not intended at once to divide into pills, it should be preserved in a piece of bladder or gut-skin placed in a covered stoneware or earthenware pot. In this state it may be occasionally moistened with a little weak spirit to prevent its getting hard.

The weight (size) of pills varies from $\frac{1}{4}$ gr. to 6 grs. If heavier than this, they are called 'boluses.' Formerly, as a general rule, they were made of 5 grs. each; but [pills of this weight are, in general, so large, that some persons find a difficulty in swallowing them. Another disadvantage of large pills is the trouble of nicely apportioning the dose,—one pill being, perhaps, too small a quantity, and two pills the reverse. Hence, 2 to 3-gr. pills are now the favourite size with both pill-takers and dispensers, notwithstanding that 5-gr. pills are still ordered in one of the authorised Pharmacopœias.

Pills are occasionally coated with gold, silver, and other substances, to render them more agreeable to the eye, or to prevent the taste of nauseous ingredients affecting the palate during deglutition. They are gilded and silvered by placing them, in the moist state, on a leaf or two of the metal in a small gallipot, and covering them in a similar manner with another leaf of metal; over the mouth of the gallipot is laid a piece of smooth writing paper, and on this the palm of the hand; a sudden and rapid circular motion is then given to the whole. If the pills are not sufficiently moist or sticky, they should be rendered so by rolling them between the fingers very slightly moistened with mucilage, before proceeding to silver them. Another method is to shake them in a similar manner with a little gold or silver dust.

When pills are to be covered with gelatin, each pill, being stuck on the point of a very thin wire four or five inches in length, is dipped into a solution of gelatin, so as to coat it completely, and the wire is then inserted into a pinchion, or a vessel containing fine sand, and left until the gelatin is firm, which occurs in about a quarter of an hour; the pins may then be easily removed by simply warming them, by placing the centre of each wire for a second or two in the flame of a spirit lamp or candle. 'Sugar-coated pills' are prepared in nearly the same way, but substituting hot and highly concentrated syrup, to which a little gelatin has been added, for a simple solution of gelatin.

M. Durden covers pills with collodion. Others have recommended for this purpose a solution of gutta percha in either chloroform or bisulphide of carbon. The ready solubility in the stomach of pills thus covered has, with justice, been questioned. Gelatin, or, still better, gelatin mixed with a little sugar, is unexceptionable in this respect; whilst it undoubtedly excludes the taste of nauseous medicines more effectually than any other substance. Mr. Furley employs a thin coating of albumen to render pills tasteless.

As pill-masses are likely to get hard and brittle by keeping, an excellent plan is to keep the dry ingredients powdered and mixed together in well-corked bottles or jars, when a portion may at any time be beaten up with

syrup, conserve, soap, &c.; according to the formula, and as wanted for use. The mixed ingredients in this state are technically known as 'species' or 'powder for' the respective pills.

"It is generally said that pills should be taken on an empty stomach, and at a considerable distance from a meal; but for ourselves, we think that it is nearly always better to take them during a meal; first, because the stomach does not then find itself immediately under the influence of substances which, if not always dangerous, seldom fail to act more or less disagreeably; secondly, because its absorbent action is more certain; and, lastly, because they are then taken more easily." (Trousseau and Revel). The meal here referred to should be a light one, from which acidulous and other substances likely to interfere with the action of the remedy should be excluded. The dose should also be increased.

In the London Pharmacopœia the singular number ('pilula') is now very properly employed to express the names of the official pill-masses; but in the other Pharmacopœias the names are given in the plural form. As the latter is almost universally adopted in speaking of magistral formulæ and nostrums, we have used it in all cases, for the sake of uniformity and for ease of reference. See **BOLUS**, **EXTRACT**, **PRESCRIBING**, and *below*.

Pills, Abernethy's. See **ABERNETHY MEDICINES** (page 4).

Pills of Acetate of Lead. *Syn.* **PILULÆ PLUMBI ACETATIS**, L. *Prep.* 1. Acetate of lead, 20 grs.; powdered camphor, 15 grs.; conserve of roses, q. s.; mix and divide into 12 pills.

2. (Radix.) Acetate of lead and powdered mallow or liquorice root, of each, $\frac{1}{2}$ dr.; simple syrup, q. s.; divide into 18 pills.—*Dose.* 1 to 5 daily, washed down with water soured with vinegar; as a powerful astringent in hæmorrhages, diarrhœa, the night-sweats in phthisis, &c. See **OPIATED LEAD PILLS**.

Pills of Acetate of Mercury. *Syn.* **PILULÆ HYDRARGYRI ACETATIS**, L. *Prep.* 1. Sub-acetate of mercury, 18 grs.; sugar of milk (or manna), 1 dr.; mucilage, q. s.; divide into 24 pills.—*Dose.* As an alterative, 1 daily; as a sialogogue, 1 every 4 or 5 hours, or oftener; in syphilis, &c. See **KEYSER'S PILLS**.

3. (Opated—Carmichael.) Acetate of mercury, camphor, and opium, of each, 30 grs.; syrup of poppies to mix. For 30 pills. Less apt to affect the stomach and bowels than the last.

Pills of Acetate of Morphia. *Syn.* **PILULÆ MORPHIÆ ACETATIS**, L. *Prep.* 1. Acetate of morphia, 2 grs.; sugar of milk, 15 grs.; conserve of roses, 20 grs.; for 12 pills. Anodyne, sedative, and soporific.—*Dose.* One, as required.

2. (Dr. A. T. Thomson.) Acetate of mer-

phia, 1 gr.; powdered foxglove, 6 grs.; powdered camphor, 10 grs.; powdered gum arabic, 8 grs.; syrup of tolu, q. s.; to be divided into 6 pills. Sedative and antispasmodic.—*Dose*. One, every 3 or 4 hours; in phthisis, palpitations, spasms, &c. The hydrochlorate of morphia may be used instead of the acetate, with advantage.

Pills of Ac'omite. *Syn.* PILULÆ ACONITI, P. EXTRACTI A., L. *Prep.* (Dr. Turnbull). Alcoholic extract of aconite, 1 gr.; liquorice powder, 12 grs.; simple syrup, q. s.; mix, and divide the mass into 6 pills.—*Dose*. One pill, every 3 or 4 hours; as a powerful anodyne and sedative in excessive action of the heart, acute rheumatism, gout, neuralgia, &c. The utmost care should be taken both in their preparation and administration.

Pills, Alibert's. See APERIENT PILLS.

Pills of Aloës. *Syn.* PILULA ALOËS SOCOTRINÆ (B. P.), PILULÆ ALOETICÆ, PILULÆ ALOËS (Ph. E.), L. *Prep.* 1. (Ph. E.) Socotrine aloes (in powder) and Castile soap, equal parts; conserve of red roses, q. s. to form a pill-mass.

2. (Ph. U. S.) Powdered aloes and Castile soap, equal parts, beat into a mass, and divided into 4-gr. pills.

Obs. "This pill may be also correctly made with the finer qualities of East Indian aloes, as the (true) Socotrine variety is very scarce; and many, not without reason, prefer (pure) Barbadoes aloes." (Ph. E.) The *dose*, as a laxative, is 5 to 10 grs.; as a purgative, 12 to 20 grs., or more. See PILLS OF ALOËS WITH SOAP.

Pills of Aloes and Assafœtida. *Syn.* PILULA ALOËS ET ASSAFÆTIDA (B. P.), *Prep.* Socotrine aloes, in powder, 1; assafœtida, 1; powdered hard soap, 1; confection of roses, 1 ($\frac{1}{2}$ confection sufficient.—*Squire*). Mix. Cathartic and antispasmodic.—*Dose*. 5 to 10 grs.

Pills of Aloes (Compound). *Syn.* PILULÆ ALOETICÆ COMPOSITÆ, PILULA ALOËS COMPOSITA (Ph. L.), PILULÆ A. COMPOSITÆ (Ph. D.), L. *Prep.* 1. (Ph. L.) Socotrine aloes (in powder), 1 oz.; extract of gentian, $\frac{1}{2}$ oz.; oil of caraway, 40 drops; treacle, q. s.; the whole to be beaten together until they form a mass proper for making pills.

2. (Ph. D.) Hepatic aloes (in powder), 2 oz.; extract of gentian and treacle, of each, 1 oz.; oil of caraway, $\frac{1}{2}$ fl. dr.; as the last.

Obs. The above is a very valuable purgative in habitual costiveness and indigestion, in all cases in which the use of aloes is not contra-indicated. The *dose* is from 5 to 15 grs., or more.

Pills of Aloes (Diluted). *Syn.* PILULÆ ALOËS DILUTÆ, L. *Prep.* 1. (Dr. Marshall Hall.) Barbadoes aloes, Castile soap, extract of liquorice, and treacle, equal parts; water, q. s.; dissolve, with heat, strain, and evaporate to the consistence of a pill-mass. Resembles the PILULA ALOËS CUM SAPONE—Ph. L.

Pills of Aloes and Assafœtida. *Syn.* PILULÆ

ALOËS ET ASSAFÆTIDA (Ph. E.), L. *Prep.* (Ph. E.) Aloes (Socotrine or East Indian, powdered), assafœtida, and Castile soap, equal parts; beat them with conserve of red roses to a proper pill-mass.—*Dose*. 5 to 10 grs., once or twice daily, as a stomachic tonic and laxative, in dyspepsia, flatulence, &c.; and 12 to 20 grs., as a purgative in similar cases. It is extremely useful in costiveness, with flatulency, occurring in hysterical and hypochondriacal subjects. The B. P. preparation is the same as this, except that hard soap is used instead of Castile soap.

Pills of Aloes and Gin'ger. *Syn.* PILULÆ ALOËS ET ZINGIBERIS, L. *Prep.* (Ph. D. 1826.) Aloes, 1 oz.; Castile soap, $\frac{1}{2}$ oz.; ginger, 1 dr.; oil of peppermint, $\frac{1}{2}$ dr.; beaten to a mass. A useful laxative in cold habits.—*Dose*. As the last.

Pills of Aloes and Ipecac'uanha. *Syn.* DR. BAILLIE'S DINNER PILLS; PILULÆ ALOËS ET IPECACUANHÆ, L. *Prep.* (Dr. Baillie.) Powdered aloes, 30 grs.; powdered ginger (finest), 45 grs.; ipecacuanha, 12 grs.; syrup of orange peel, q. s. to mix. For 24 pills.—*Dose*. One, about an hour before dinner.

Pills of Aloes and Iron. *Syn.* PILULÆ ALOËS ET FERRI (Ph. E.), L. *Prep.* 1. (B. P.) Barbadoes aloes, 2; sulphate of iron, $1\frac{1}{2}$; compound powder of cinnamon, 3; confection of roses, 4; mix (6 of confection required. *Squire*).—*Dose*. 5 to 10 grs.

2. (Ph. E.) Sulphate of iron, 3 parts; Barbadoes aloes, 2 parts; aromatic powder, 6 parts; conserve of red roses, 8 parts; powder the aloes and sulphate of iron separately, beat the whole to a mass, and divide this into 5-gr. pills. An excellent medicine in chlorosis, hysteria, and atonic amenorrhœa.—*Dose*. 1 to 3 pills daily.

Pills of Aloes and Mas'tic. See DINNER PILLS.

Pills of Aloes and Mer'cury. *Syn.* PILULÆ ALOËS CUM HYDARGYRO, L. See APERIENT PILLS (8).

Pills of Aloes and Myrrh. *Syn.* RUFUS'S PILLS; PILULA ALOËS CUM MYRRHÆ (Ph. L. & D.), PILULÆ RUHI OR COMMUNES (Ph. L. 1720), P. ALOËS ET MYRRHÆ (B. P., Ph. E.), L. *Prep.* 1. (Ph. L.) Socotrine or hepatic aloes (in powder, $\frac{1}{2}$ oz.; saffron, myrrh (powdered), and soft soap (Ph. L.), of each, 2 drs.; treacle, q. s. to form a pill-mass.

2. (Ph. D.) Hepatic aloes, 2 oz.; myrrh, 1 oz.; dried saffron, $\frac{1}{2}$ oz.; all in powder; treacle, 2 $\frac{1}{2}$ oz.

3. (Ph. E.) Aloes (Socotrine or East Indian), 4 parts; myrrh, 2 parts; saffron, 1 part; beat them to a pill-mass with conserve of red roses, q. s.

4. (Ph. L. 1836 and Ph. D. 1826). Aloes (in powder), 2 oz.; saffron and powdered myrrh, of each, 1 oz.; syrup, q. s. to form a pill-mass.

5. (B. P.) Socotrine aloes, 2; myrrh, 1; dried saffron, $\frac{1}{2}$; confection of roses, 2 $\frac{1}{2}$ (3 are

required.—*Squire*. Mix. Stimulant and cathartic. *Dose*. 5 to 10 grs.

Obs. This compound is a most excellent stomachic purgative and emmenagogue, when there are no febrile symptoms present. It is said to have been employed ever since the time of Rhazes, and is still in extensive use.—*Dose*. 10 to 20 grs.

Pills of Aloes and Rhubarb. *Syn.* PILULE ALOËS ET RHEI, P. R. CUM RHEO, L. *Prep.* Powdered Socotrine or hepatic aloes, powdered rhubarb, and soft soap (Ph. L.), of each, $\frac{1}{2}$ dr.; oil of chamomile, 10 drops; for 30 pills.—*Dose*. 1 to 5, either as a stomach tonic or laxative; especially in dyspepsia, with loss of appetite.

Pills of Aloes and Rose-juice. *Syn.* PILULE ALOËS ROSATÆ, L.; PILULES ANGLIQUES, GRAINS DE SANTÉ, Fr. *Prep.* Take aloes and rose juice, of each, 4 oz.; juice of borage and chicory, of each, 2 oz.; dissolve with heat, evaporate to an extract; add, of rhubarb, 2 drs.; agaric, 1 dr.; and divide the mass into $1\frac{1}{2}$ -gr. pills.—*Dose*. 4 to 12, as a purge.

Pills of Aloes with Soap. *Syn.* PILULA ALOËS CUM SAPONE (Ph. L.), L. *Prep.* (Ph. L.) Powdered extract of Barbadoes aloes, soft soap, and extract of liquorice, equal parts; treacle, q. s. to form a pill-mass.—*Dose*. 10 to 20 grs.; in the usual cases in which aloes is administered. It is more readily soluble in the juices of the primæ viæ, and is milder than most of the aloetic pills without soap. See PILLS OF ALOES (Diluted).

Pills, Alterative. *Syn.* PILULE ALTERANTES, L. See CALOMEL, MERCURIAL, and PLUMMER'S PILLS, &c.

Pills of Alum. *Syn.* PILULE ALUMINIS, P. A. COMPOSITÆ, L. *Prep.* 1. (Augustin.) Alum, 20 grs.; benzoic acid, 6 grs.; powdered gum and white sugar, of each, 10 grs.; water, q. s. to form a mass. For 36 pills. In phthisis and atonic mucous discharges. The whole to be taken in the course of 2 or 3 days.

2. (Capuron.) Catechu, 1 dr.; alum, $\frac{1}{2}$ dr.; opium, 10 grs.; syrup of red roses, q. s.; divide into 5-gr. pills.—*Dose*. 1 to 3; in chronic diarrhoea and leucorrhœa.

3. (Radius.) Alum and catechu, equal parts; extract of gentian, q. s. to mix; divide into 2 or 3-gr. pills.—*Dose*. 2 to 4, every four hours; in passive hæmorrhages, mucous discharges, and chronic diarrhoea.

Pills of Ammoniacum. *Syn.* PILULE AMMONIACI, L. *Prep.* 1. Gum ammoniacum, 1 dr.; powdered sugar, $\frac{1}{2}$ dr.; conserve of hips, q. s. In old coughs and hysterical affections.

2. (Compound.)—a. (Ainslie.) Ammoniacum, 1 dr.; mercurial pill, 15 grs.; powdered squills, 6 or 8 grs.; simple syrup, q. s. For 16 pills. In asthmatic coughs, with deranged action of the liver.—*Dose*. One, 2 or 3 times a day.

b. (W. Cooley.) Ammoniacum and sagapenum, of each, 1 dr.; dried sulphate of iron, $\frac{1}{2}$ dr.; conserve of hips, q. s. In obstructed

menstruation, and in the chronic diarrhoea of hysterical subjects.

Pills of Ammoniated Cop'per. *Syn.* PILULE CUPRI AMMONIATI (Ph. E.), P. C. AMMONIURETI, L. *Prep.* (Ph. E.) Ammoniated copper (in fine powder), 1 part; bread-crumbs, 6 parts; solution of carbonate of ammonia, q. s. to make a mass, which is to be divided so that each pill may contain $\frac{1}{2}$ gr. of ammoniated copper. In epilepsy, and in some other spasmodic diseases.—*Dose*. 1 pill, night and morning, gradually increased to 5 or 6.

Pills of Ammoniated Iron. *Syn.* PILULE FERRI AMMONIATI, P. F. AMMONIO-CHLORIDI, L. *Prep.* 1. (Dr. Copland.) Ammoniated iron, 1 dr.; aloes and extract of gentian, of each, $\frac{1}{2}$ dr.; for 30 pills. In scrofula, chlorosis, amenorrhœa, &c.

2. (Radius.) Ammoniated iron and galbanum, of each, 1 dr.; assafoetida, 2 drs.; castor, 20 grs.; tincture of valerian, q. s. For 3-gr. pills.—*Dose*. 2 pills, night and morning; in atonic nervous disorders, epilepsy, &c.

Pills of Ammonio-citrate of Iron. *Syn.* PILULE FERRI AMMONIO-CITRATIS, L. *Prep.* (Beral.) Ammonio-citrate of iron, 1 dr.; white sugar, 3 drs.; mucilage, q. s. to mix. For 3-gr. pills.—*Dose*. 1 to 3, or more; as a mild chalybeate tonic.

Pills, Analeptic. See JAMES'S PILLS, &c.

Pills, Anderson's Scot's. Various formulae for these pills are extant, the products of which differ widely from the genuine article. Dr. Paris, some years since, declared that they consisted of Barbadoes aloes, jalap, and oil of aniseed. "A careful examination of the proprietary article, with other facts that have come to our knowledge, leads us to believe that the first of the following formulae is the one now employed in the preparation of the 'Grana Angelica,' or 'Anderson's True Scot's Pills,' of the present day." (Cooley.)

Prep. 1. From Barbadoes aloes, 7 lbs.; jalap (in fine powder), 2½ lbs.; treacle, $\frac{1}{2}$ lb.; soap, 6 oz.; melted together by the heat of a water bath, and, when partly cold, aromatised by stirring in of oil of aniseed, 1 oz. The mass is divided into about 3½-gr. pills, of which 26 or 27 are placed in each 1s.-1½d. box. A mild and useful aperient.—*Dose*. 5 to 15 grs., or more.

2. (Original formula.) Socotrine aloes, 1 oz.; best myrrh, $\frac{1}{2}$ oz.; saffron, 1 dr.; separately pounded very fine; mix them, in an earthen pipkin, with a spoonful each of water and sweet oil, by the heat of a slow fire, and form the mass into "common-sized pills." From a copy of the original document in the Chapel of the Rolls.

3. (P. Cod.) Aloes and gamboge, of each, 6 drs.; oil of aniseed, 1 dr.; syrup, q. s.; mix, and divide into 4-gr. pills. Much more powerful than the preceding, and closely resembling Morison's 'No. 2 pills.'

4. (Phil. Coll. of Pharm.) Barbadoes aloes (in powder), 3 lbs.; Castile soap, $\frac{1}{2}$ lb.; colo-

cynth and gamboge (both in fine powder), 2 oz.; oil of aniseed, 1 oz.; beat to a mass with water, q. s., and divide it into 3-gr. pills. Less active than the last, but more so than the 'True Scot's Pills.'

Pills, Anodyne. *Syn.* PILULÆ ANODYNÆ, L. *Prep.* 1. (Hosp. F.) Opium (in powder), 6 grs.; camphor, 15 grs.; conserve of roses, q. s.; divide into 12 pills.—*Dose.* 1 to 3, as required.

2. (A. T. Thomson.) Calomel, potassio-tartrate of antimony, and opium, equal parts; syrup of saffron, q. s.; divided in 3½-gr. pills. In acute rheumatism and neuralgia.—*Dose.* 1 pill, at bedtime.

Pills, Antibilious. All the ordinary aperient and stomachic pills may be classed under this head. See the names of their proprietors or reputed inventors, or those of their leading ingredients.

Pills, Antichlorotic. *Syn.* PILULÆ ANTICHLOROTICÆ, L. *Prep.* 1. (Radius.) Aloes and carbonate of iron, of each, ½ dr.; gum ammoniacum, 1 dr.; extract of taraxacum, q. s. For 3-gr. pills.—*Dose.* 2 to 6, night and morning; in chlorosis, amenorrhœa, &c.

2. (Trousseau & Reveil.) Porphyrised iron filings, 1 dr.; extract of wormwood, q. s. For 36 pills.—*Dose.* 3 or 4; as the last.

Pills, Antimo'nial (Compound). *Syn.* PILULÆ ANTIMONIALIS COMPOSITÆ, P. ANTIMONII CO., L. *Prep.* 1. Antimonial powder, ½ dr.; calomel, camphor, and powdered opium, of each, 6 grs.; conserve of roses, q. s.; divide into 4-gr. pills.—*Dose.* 2, at night; in acute rheumatism, neuralgia, chronic coughs, &c.

2. (St. B. Hosp.) Tartar emetic, 1 gr.; guaiacum and pill of aloes and myrrh, of each, ½ dr.; treacle, to mix. For 16 pills. As the last.

Pills, Antispasmodic. *Syn.* PILULÆ ANTISPASMODICÆ, L. *Prep.* (Dr. A. T. Thomson.) Opium, 1 gr.; Russian castor, 13 grs.; powdered digitalis, 2 grs.; syrup, to mix; divide into 4 pills.—*Dose.* 1 or 2, two or three times a day; in spasmodic asthma, difficulty of breathing, &c. Several other formulæ for antispasmodic pills will be found both above and below.

2. (Trousseau & Reveil.) Musk, 15 grs.; extract of valerian, ½ dr.; liquorice powder, q. s. For 20 pills.—*Dose.* 1 every two hours, until there is a marked improvement in the symptoms; in pneumonia, accompanied by delirium, especially in drunkards; in spasms of the uterus, and in various other spasmodic affections.

Pills, Aperient. *Syn.* PILULÆ APERIENTES, L. *Prep.* 1. Hepatic aloes, 2 drs.; rhubarb and Castile soap, of each, 1 dr.; scammony, ½ dr.; (all in powder;) essential oil (at will), 10 or 12 drops; beaten to a smooth mass, and divided into pills.

2. Compound extract of colocynth (Ph. L. 1836), 1½ dr.; extract of gentian, ½ dr.; powdered ipecacuanha, 20 grs.; oil of cloves, cara-

way, or cassia, a few drops. In dyspepsia, loss of appetite, &c.

3. (Abernethy's.) See page 4.

4. (Alibert's.) From calomel, resin of jalap, and Castile soap, of each, 1 dr.; oil of orange peel or citron, 6 or 8 drops. For 60 pills. As an occasional mild purgative, especially in bilious habits and worms.

5. (Sir B. Brodie.) Compound extract of colocynth and mercurial pill, of each, ½ dr.; scammony and Castile soap, of each, 15 grs.; oil of caraway, 6 or 7 drops. For 24 pills. As the last.

6. (W. Cooley.) Aloes, 1½ dr.; jalap and Castile soap, of each, 1 dr.; rhubarb and cardamoms, of each, ½ dr.; (all in powder;) oil of juniper, 12 drops. For 3-gr. pills. A useful mild aperient, for either frequent or occasional use.

7. (Dr. Copland.) Compound extract of colocynth (Ph. L. 1836), 40 grs.; extract of henbane, 30 grs.; Castile soap, 12 grs.; ipecacuanha, 6 or 7 grs. For two dozen pills.—*Dose.* 2, on retiring to rest. As an aperient in nervous affections and irritable habits.

8. (Harvey.) Mercurial pill and powdered aloes, of each, ½ dr.; ginger, 20 grs. For 24 pills. In constipation, attended with a deficiency of bile.

9. (Dr. Neligan.) Compound colocynth pill and soap of jalap, equal parts; either with or without a few drops of some aromatic essential oil. For 4 or 5-gr. pills. As an aperient for general use.

10. (Sir C. Scudamore.) Compound extract of colocynth, 40 grs.; extract of rhubarb, ½ dr.; scammony and soap, of each, 12 grs.; oil of caraway, 5 or 6 drops. For 20 or 24 pills.

11. (Stahl's; PILULÆ APERIENTES STAHLII, —Ph. Hannov.) Powdered aloes, 1 oz.; compound extract of colocynth, ½ oz.; iron filings, 2 drs.; mucilage, q. s. In amenorrhœa, low habits, and worms.

12. (Vance.) Compound extract of colocynth, 80 grs.; extract of rhubarb, 12 grs.; Castile soap, 6 or 8 grs.; oil of cinnamon, 4 or 5 drops.

Obs. The products of the above formulæ may be divided into pills of any size deemed most agreeable to the patient, and they may be aromatised by the addition of any essential oil at will. The dose varies, according to circumstances, from 5 to 10 or 12 grs., or more. Those containing aloes or mercurials are best taken at bedtime. For other formulæ, see the various official and other pills containing aloes, colocynth, gamboge, rhubarb, scammony, &c.

Pills, Aromatic. *Syn.* PILULÆ AROMATICÆ, L. *Prep.* (Ph. L. 1746.) Compound powder of aloes, 8 oz.; balsam of Peru, ½ oz.; syrup of orange peel, q. s. Aperient, sudorific, and nervine.—*Dose.* 10 to 20 grs.

Pills of Arseniate of Iron. *Syn.* PILULÆ FERRI ARSENIIATIS, L. *Prep.* (Biett.) Arseniate of iron, 3 grs.; extract of hops, 2 drs.;

powdered mallow-root, $\frac{1}{2}$ dr.; syrup, q. s. For 48 pills.—*Dose.* 1 to 2, daily; in cancerous, scrofulous, and herpetic affections. See ARSENICAL PILLS.

Pills of Arseniate of So'da. *Syn.* PILULÆ SODÆ ARSENIATIS, L. *Prep.* (Erasmus Wilson.) Arseniate of soda, 2 grs.; distilled water, the smallest possible quantity to dissolve it; powdered gum guaiacum, $\frac{1}{2}$ dr.; oxysulphuret of antimony, 20 grs.; mucilage, q. s. For 24 pills.—*Dose.* 1 pill, as the last; in herpes, &c. See ARSENICAL PILLS.

Pills, Arsenical. *Syn.* ASIATIC PILLS, CARNATIC P., EAST INDIAN P., TANJORE P.; PILULÆ ARSENICI, P. ARSENICALIS, P. ASIATICÆ, P. ACIDI ARSENIOSI, L. *Prep.* (P. Cod.) Arsenious acid, 1 gr.; black pepper (in fine powder), 12 grs.; rub them together for some (considerable) time in an iron mortar, then add, of powdered gum, 2 grs.; water, q. s. to make a mass; which is to be accurately divided into 12 pills. Each pill contains $\frac{1}{12}$ gr. of white arsenic.

Obs. This compound is commonly employed in the East Indies in syphilis, elephantiasis, intermittents, the bites of venomous snakes, &c.; and as a preventive to hydrophobia. The common practice in England is to employ 16 grs. of pepper to 1 gr. of arsenious acid, and to divide the mass into 16 instead of 12 pills. The *dose* is one or two pills daily, taken *after* a meal. The use of all compounds containing arsenic demands great caution.

Pills, Arsenical (Opiated). *Syn.* PILULÆ ARSENICI CUM OPIO, L. *Prep.* (A. T. Thomson.) Arsenious acid, 2 grs.; powdered opium, 8 grs.; Castile soap, 20 grs.; simple syrup, q. s. For 24 pills.—*Dose.* As the last; in intermittents, herpes, lepra, psoriasis, periodical headaches, neuralgia, &c. See *above*.

Pills, Asiatic. See ARSENICAL PILLS.

Pills of Assafetida. *Syn.* PILULÆ ASSAFETIDÆ (Ph. E. & U. S.), L. *Prep.* 1. (Ph. E.) Assafetida, galbanum, and myrrh, of each 3 parts; conserve of red roses, 4 parts, or q. s.; mix, and beat them to a proper pill-mass.

2. (Ph. U. S.) Assafetida, $1\frac{1}{2}$ oz.; Castile soap, $\frac{1}{2}$ oz.; water, q. s.; divide into 240 pills.

Obs. The above (particularly the last) are stimulant and antispasmodic.—*Dose.* 5 to 10 grs., twice or thrice daily; in hysterical affections, &c. See *below*.

Pills of Assafetida (Compound). *Syn.* PILULÆ ASSAFETIDÆ COMPOSITÆ (B. P., Ph. D.) *Prep.* 1. (Ph. D.) Assafetida, 2 oz.; galbanum, myrrh, and treacle, of each, 1 oz.; mix in a capsule, by the heat of steam or a water bath, and stir until it becomes a uniform mass.—*Dose, &c.* As the last. The B. P. directs the quantity of galbanum to be double the above.

2. (Hosp. F.) Assafetida, 1 dr.; soft soap (Ph. L.), 20 grs.; ipecacuanha and squills, of each (in powder), 12 grs.; syrup, q. s.—*Dose.* 5 to 10 grs.; in chronic asthmas, coughs, &c.

Pills of Assafetida with Iron. *Syn.* PILULÆ ASSAFETIDÆ CUM FERRO, L. *Prep.* (W. Cooley.) Assafetida, 1 dr.; extract of chamomile, $\frac{1}{2}$ dr.; mix with a slight heat; add, of dried protosulphate of iron, 15 grs.; oil of caput, 10 drops; and divide into 36 pills. In hypochondriasis, hysteria, amenorrhœa, chlorosis, &c., after an aperient.

Pills, Asthma. *Syn.* PILULÆ ANTASTHMATICÆ, L. *Prep.* 1. (Expectorant.) From compound squill pill, 20 grs.; calomel, 5 grs.; powdered opium, 3 grs.; made into 6 pills.—*Dose.* 1 or 2, at bedtime. Expectorant, and sometimes laxative.

2. (Tonic.) From compound iron pill, 2 drs.; extract of gentian, 1 dr.; mix, and divide into 60 pills.—*Dose.* 2, night and morning, with an occasional dose of laxative medicine.

Pills, Astringent. *Syn.* PILULÆ ASTRINGENTES, L. See PILLS OF ACETATE OF LEAD, ALUM, GALLIC ACID, NITRATE OF SILVER, SULPHATE OF IRON, TANNIN, &c.

Pills, Bacher's Tonic. *Syn.* PILULÆ TONICÆ BACHERI, L. *Prep.* 1. (Dr. Paris.) Extract of black hellebore and powdered myrrh, of each, 1 oz.; powdered blessed thistle, 3 drs.; mix, and divide into 1-dr. pills.—*Dose.* 2 to 6, three times a day.

2. (P. Cod.) Alkaline extract of hellebore and extract of myrrh, of each, 2 drs.; powdered blessed thistle, 1 dr. For 4-gr. pills.—*Dose.* 1 or 2, as the last. An alternative tonic, hydragogue, and emmenagogue; in debility, dropsy, amenorrhœa, &c. A favourite remedy in some parts of Europe.

Pills, Dr. Baillie's. *Prep.* (Cooley.) Aqueous extract of aloes and compound extract of colocynth, of each, 3 drs.; Castile soap, 1 dr.; oil of cloves, 15 drops. For 4-gr. pills. A good occasional aperient.—*Dose.* 1 to 3, at bedtime, or early in the morning. See DINNER PILLS.

Pills, Barbarossa's. These are supposed to have been the first mercurial preparation employed in medicine. They consisted of quick-silver, rhubarb, musk, and amber.

Pills, Rev. D. Barclay's. *Prep.* (Cooley.) Resinous extract of jalap, 1 dr.; almond or Castile soap, $1\frac{1}{2}$ dr.; extract of colocynth, 2 drs. (or powdered colocynth, 3 drs.); gum guaiacum, 3 drs.; potassio-tartrate of antimony, 10 grs.; oil of juniper, 8 or 10 drops; oils of caraway and rosemary, of each, 4 drops; make a mass with syrup of buckthorn (the smallest possible quantity), and divide into 4-gr. pills. A diaphoretic aperient.—*Dose.* 1 to 3, at bedtime.

Pills, Dr. Baron's. *Prep.* From compound rhubarb pill, 30 grs.; compound extract of colocynth, 20 grs.; powdered ipecacuanha, 6 grs. For 3-gr. pills. An excellent stomachic aperient.—*Dose.* 1 to 3 pills, at bedtime; in dyspepsia, loss of appetite, &c.

Pills, Barthéz's. *Prep.* From myrrh, 1 dr.; aloes, $\frac{1}{2}$ dr.; musk, 15 grs.; camphor, 12 grs.; balsam of Peru, q. s. to form a mass. For 3-gr. pills.—*Dose.* 2, thrice daily; in hysteria, amenorrhœa, chlorosis, &c.

Pills, Bath Digestive. *Prep.* (Cooley.) Rhu-
barb, 2 oz.; ipecacuanha and Castile soap, of
each, $\frac{1}{2}$ oz.; capsicum, ginger, and gamboge, of
each, $\frac{1}{4}$ oz.; (all in powder;) syrup of buck-
thorn, q. s. For 4-gr. pills.—*Dose.* 1, as a din-
ner pill; 2 or 3 as an aperient.

Pills of Be'beerine. *Syn.* PILULÆ BEBERE-
INÆ, L. *Prep.* From sulphate of bebeerine, $\frac{1}{2}$
dr.; aromatic confection, q. s.; oil of cajeput,
5 or 6 drops. For 18 pills.—*Dose.* 1 to 3,
every four hours; as an antiperiodic, instead
of bark or quinine.

Pills, Be'chic. PILULÆ BECHICÆ, L. *Prep.*
(Trousseau and Reveil.) Extract of digitalis,
15 grs.; white oxide of antimony, 30 grs.; ex-
tract of liquorice, 40 grs.; mix carefully, and
divide into 40 pills. Expectorant and seda-
tive.—*Dose.* 2 to 12, or more; in cases of irri-
tating coughs, catarrh of the pulmonary capil-
laries or bronchia, &c. See COUGH PILLS.

Pills, Beddoe's. *Prep.* From dried (efflo-
resced) carbonate of soda, 1 dr.; soap, $1\frac{1}{2}$ dr.;
oil of juniper, 12 drops; syrup of ginger, q. s.;
divide into 30 pills. In gravel, stone, &c.
—*Dose.* 2 to 5.

Pills of Belladon'na (Compound). *Syn.* PILU-
LÆ BELLADONNÆ COMPOSITÆ, L. *Prep.* 1.
(Ainslie.) Extract of belladonna, mercurial
pill, and powdered ipecacuanha, equal parts.
For 3-gr. pills.—*Dose.* 1, night and morning,
in cancerous and glandular affections.

2. (Debreynne.) Camphor and assafetida, of
each, 1 dr.; extract of belladonna, 20 grs.; ex-
tract of opium, 5 grs.; syrup, q. s. For 48
pills.—*Dose.* 1 pill, gradually increased to 6,
daily. In hysteria, amenorrhœa, &c.

Pills, Belloste's. See MERCURIAL PILLS.

Pills, Bennet's. See FULLER'S PILLS.

Pills of Bichlo'ride of Mercury†. Pills of
corrosive sublimate.

Pills of Bichlo'ride of Platinum. *Syn.*
PILULÆ PLATINI BICHLORIDI, L. *Prep.* (Dr.
Hoefer.) Bichloride of platinum, $7\frac{1}{2}$ grs.; ex-
tract of guaiacum, 1 dr.; liquorice powder, q. s.
For 24 pills.—*Dose.* 1 pill, twice or thrice
daily; as an alternative, in syphilis, &c.

Pills, Bicker's. *Prep.* From rust (carbonate)
of iron, 2 drs.; aloes, myrrh, and sulphur, of
each, 1 dr.; ox-gall, q. s. to mix. For 4-gr.
pills.—*Dose.* 1 to 6, morning and evening; in
debility, chlorosis, &c.

Pills of Bit'tersweet. *Syn.* PILULÆ DUL-
CAMARÆ, L. *Prep.* (Radius.) Extract of
bittersweet (dulcamara), 1 dr.; crude antimony
and bittersweet (in powder), of each, $\frac{1}{2}$ dr.
For 3-gr. pills.—*Dose.* 6 to 12, twice or thrice
a day; in obstinate skin diseases.

Pills, Bland's. *Syn.* PILULÆ ANTICHLORO-
TICÆ, L. *Prep.* (Trousseau and Reveil.) Sul-
phate of protoxide of iron, 2 parts; reduce it
to powder, and dry it in a stove at 104° Fahr.;
add to this dry carbonate of potassa, 2 parts;
honey, 1 part; and form the mass into 50
pills. Tonic and emmenagogue.—*Dose.* 1 to
10, daily; in debility, chlorosis, &c.

Pills, Blue. See MERCURIAL PILLS.

Pills, Bontius's. *Syn.* PILULÆ HYDROGOGÆ,
P. H. BONTII, L. *Prep.* (B. Cod.) Socotrine
aloes, gamboge, and gum ammoniacum; of each,
1 dr.; white-wine vinegar, 6 drs.; dissolve by
heat, at twice, press out the liquor, evaporate
to a pilular consistence, and divide into 4-gr.
pills.—*Dose.* 1 to 3; as a strong cathartic, in
dropsy.

Pills, Brigg's Gout and Rheumatic. This
nostrum closely resembles in appearance, odour,
and properties, the PLUMMER'S PILL of the
Pharmacopœia; the two are probably iden-
tical. (Cooley.)

Pill of Bro'mide of Iron. *Syn.* PILULÆ
FERRI BROMIDI, L. *Prep.* (Magendie.) Bro-
mide of iron and powdered gum arabic, of each,
12 grs.; conserve of roses, 20 grs.; mix, and
divide into 20 pills. They should be kept in
a dry, corked phial. Tonic and alterative.—
Dose. 1 to 2, night and morning; in debility,
especially that of scrofulous habits, in chloro-
sis, &c.

Pills of Bru'cine. *Syn.* PILULÆ BRUCINÆ,
L. *Prep.* (Magendie.) Brucine, 12 grs.; con-
fection of roses, $\frac{1}{2}$ dr.; carefully mixed and
divided into 24 pills, which are recommended
to be silvered. The quantity of the confection
may be advantageously doubled.—*Dose.* 1 pill,
night and morning; in the same affections as
those for which strychnine is administered.
The acetate, hydrochlorate, or sulphate of bru-
cine may be substituted for the alkaloid in the
above formula, in a slightly larger quantity.

Pills of Cal'omel. *Syn.* PILULÆ CALOMELA-
NOS, P. E. CALOMELANE, P. HYDRARGYRI SUB-
CHLORIDI, P. H. CLORIDI†, P. H. C. MITIS
(Ph. U. S.), L. *Prep.* 1. Calomel, 4 drs.;
powdered gum arabic, 1 dr.; simple syrup, q. s.;
mix, and divide into 240 pills. Each pill con-
tains 1 gr. of calomel. A convenient form of
exhibiting this drug when uncombined with
other remedies.—*Dose.* 1 to 5 pills, according
to the indication.

2. (U. C. Hosp.) Calomel, 2 drs.; rhubarb,
 $1\frac{1}{2}$ dr.; confection of senna, q. s. For 4 dozen
pills. An excellent alternative aperient, espe-
cially in hepatic affections.

Pills of Calomel (Compound). *Syn.* PLUM-
MER'S PILLS, RED ?; PILULA HYDRARGYRI
SUBCHLORIDI COMPOSITA, PILULÆ CALOME-
LANOS COMPOSITÆ (Ph. E. & D.), PILULÆ
PLUMMERI, PILULA HYDRARGYRI CHLORIDI
COMPOSITA (Ph. L.). *Prep.* 1. (Ph. L.), L.
Chloride of mercury (calomel) and oxysulphide
of antimony, of each, 2 drs.; rub them together,
add of guaiacum (in powder) and treacle, of
each, 4 drs., and form the whole into a pill-
mass.

2. (Ph. E.) Calomel and golden sulphide of
antimony, of each, 1 part; guaiacum (in powder)
and treacle, of each, 2 parts; beat the
whole to a pill-mass, and divide it into 6-gr.
pills.

3. (Ph. D.) Calomel and precipitated sul-
phide of antimony, of each 1 dr.; triturate
them together, then add, of guaiacum resin (in

powder), 2 drs.; castor oil, 1 fl. dr.; and beat the whole to a uniform mass.

4. (B. P.) Calomel, 1; sulphurated antimony, 1; guaiac resin (in powder), 2; castor oil, 1; mix.—*Dose.* 5 to 10 grs.

Obs. An excellent alternative pill; very useful in lepra, in secondary syphilis affecting the skin, and in various other chronic cutaneous diseases; also in dyspepsia and liver complaints.—*Dose.* 3 to 10 grs., night and morning.

Pills of Calomel and Opium. *Syn.* PILULÆ CALOMELANOS ET OPII (Ph. E.), L. *Prep.* (Ph. E.) Calomel, 3 parts; opium, 1 part; conserve of red roses, q. s.; divide the mass so that each pill may contain 2 grs. of calomel.—*Dose.* 1 or 2 pills, in rheumatism, facial neuralgia, and various inflammatory affections. They offer a convenient form for gradually introducing mercury into the system, and, if continued, induce salivation.

Pills of Camphor. *Syn.* PILULÆ CAMPHORÆ, P. CAMPHORATÆ, L. *Prep.* Camphor and sugar, of each (in powder), 2 parts; conserve of hips, 1 part. For 3-gr. pills. Anaphrodisiac, sedative, diaphoretic, and nervine.—*Dose.* 1 to 5, twice or thrice a day.

Pills of Camphor (Compound). *Syn.* PILULÆ CAMPHORÆ COMPOSITÆ, P. CAMPHORATÆ C., L. *Prep.* 1. (Dupuytren.) Camphor, 24 grs.; pure musk, 8 grs.; opium, 2 grs.; syrup, q. s.; divide into 12 pills.—*Dose.* 1 to 4, three or four times daily; in putrescent sores, hospital gangrene, &c.

2. (Fr. Hosp.) Gum ammoniacum, 40 grs.; camphor, 30 grs.; musk, 10 grs.; opium, 5 grs.; tincture of valerian, q. s.; divide into 4-gr. pills.—*Dose.* 2 to 6 pills daily; in nervous and hysterical affections, &c.

3. (Ricord.) Camphor and lactucarium (or extract of lettuce), equal parts; divide into 4-gr. pills.—*Dose.* 3 to 6 pills daily; as an anaphrodisiac.

4. (U. C. Hosp.) Camphor, 20 grs.; assafoetida, 1 dr.; extract of valerian, 2 drs. For 30 pills. As No. 2.

Pills of Cantharides. *Syn.* PILULÆ CANTHARIDIS, P. C. COMPOSITÆ, L. *Prep.* 1. Cantharides (in very fine powder), 8 grs.; extract of gentian, $\frac{1}{2}$ dr.; liquorice powder, 10 grs. For 12 pills.—*Dose.* 1 to 4 daily; as a diuretic, emmenagogue, &c.

2. (Ellis.) Cantharides (in very fine powder), 18 grs.; opium and camphor, 36 grs.; mix, and divide into 36 pills.—*Dose.* 1 pill, at bedtime; as an aphrodisiac, in parties labouring under general debility. They should be used with extreme caution, and but seldom.

Pills of Caoutchouc. *Syn.* PILULÆ GUMMI ELASTICI, L. *Prep.* (Bonis.) India rubber, cut into small squares or spheres, then moistened with syrup of tolu, and, lastly, shaken in a box with a mixture of powdered gum and sugar. In phthisis.—*Dose.* 1 pill, three or four times a day. They pass through the primæ viæ unaltered, and may therefore fairly be presumed to be inert.

Pills of Cap'sicum. *Syn.* CAYENNE PEPPER PILLS; PILULÆ CAPSICI, L. *Prep.* 1. (Guy's Hosp.) Capsicum, 1 part; rhubarb, 2 parts; (both in powder;) treacle, q. s.; mix, and divide into 3½-gr. pills.—*Dose.* 1 to 3, an hour before dinner; to create an appetite and promote digestion.

2. (Radius.) Powdered capsicum, 20 grs.; extract of gentian, 1 dr.; powdered gentian, q. s. to form a mass. For 60 pills.—*Dose.* 2 to 4 pills, thrice daily; in chronic dyspepsia, especially in the loss of tone of the stomach arising from intemperance.

Pills of Car'bonate of Iron. *Syn.* VALLET'S PILLS; PILULÆ FERRI CARBONATIS (Ph. E.), L. *Prep.* (B. P., Ph. E.) Saccharated carbonate of iron, 4 parts; conserve of red roses, 1 part; mix, and divide the mass into 5-gr. pills.—*Dose.* 1 to 3, or more; as a mild chalybeate and antichlorotic. 5 to 20 grs., B. P. For another formula, see BLAUD'S PILLS (above).

Pills, Catarrh'. *Syn.* PILULÆ ANTICATARRHALES, L. *Prep.* 1. (Trousseau and Reveil.) Turpentine, 4 drs.; ammoniacum, 1 dr.; balsam of tolu, $\frac{1}{2}$ dr.; aqueous extract of opium, 6 grs.; liquorice powder, q. s.; mix, and divide into 80 pills.—*Dose.* 5 or 6 pills; in chronic catarrh of the bronchi and bladder.

2. (Trousseau & Reveil.) Alcoholic extract of aconite, 30 grs.; sulphuret of calcium, 16 grs.; powdered sugar, q. s. For 24 pills.—*Dose.* 1 pill, three or four times daily; in chronic pulmonary catarrh.

Pills, Cathartic. *Syn.* PILULÆ CATHARTICÆ, L. *Prep.* 1. (Dr. Collier.) Calomel, 10 grs.; powdered jalap and prepared chalk, of each, $\frac{1}{2}$ dr.; oil of caraway, 10 drops; syrup of buckthorn, to mix; divide into 5-gr. pills.—*Dose.* 1 to 4.

2. (Dr. A. T. Thomson.) Scammony, 4 grs.; extract of taraxacum, 16 grs.; divide into 6 pills.—*Dose.* 3 pills, twice daily; in hypochondriasis and chronic inflammation of the liver.

3. (A. T. Thomson.) Calomel, 15 grs.; powdered jalap, 45 grs.; mucilage, q. s. to mix. For 18 pills.—*Dose.* 1 to 3, at night, to empty the bowels, in bilious affections. Other formulæ for cathartic pills will be found both above and below.

Pills, Cathartic (Compound). *Syn.* PILULÆ CATHARTICÆ COMPOSITÆ, L. *Prep.* (Ph. U. S.) Compound extract of colocynth, 4 drs.; powdered extract of jalap and calomel, of each, 3 drs.; powdered gamboge, 40 grs.; water, q. s.; mix, and divide into 180 pills. An excellent purgative, especially in bilious affections, dyspepsia, &c.—*Dose.* 1 to 3 pills.

Pills, Chamberlain's Restorative. A nostrum composed of cinnabar and milk of sulphur, equal parts; beaten up with conserve of hips.

Pills of Cham'omile. *Syn.* PILULÆ ANTHEMIDIS, P. FLOREM CHAMÆMELI, L. *Prep.* Extract of gentian, 1 dr.; powdered aloes, $\frac{1}{2}$ dr.; powdered rhubarb, 20 grs.; oil of cha-

momile, 10 drops. A tonic and stomachic aperient.—*Dose.* 5 to 15 grs. This forms the 'chamomile pills' of the shops. They should be kept in a corked phial. See *below*.

Pills of Chamomile (Compound). *Syn.* PILULÆ ANTHEMIDIS COMPOSITÆ, L. *Prep.* 1. (Ainslie.) Extract of chamomile, 1 dr.; assa-fœtida, $\frac{1}{2}$ dr.; powdered rhubarb, 20 grs.; divided into 30 or, better, 36 pills.—*Dose.* 1, as a dinner pill; or 2 to 3, twice a day, in flatulent dyspepsia.

2. (Beasley.) Aqueous extract of aloes, 12 grs.; extract of chamomile, 36 grs.; oil of chamomile, 3 drops. For 12 pills.—*Dose.* 2, at night, or twice a day; in dyspepsia, loss of appetite, &c. See NORTON'S PILLS.

Pills, Chapman's. *Prep.* Mastic, 12 grs.; aloes, 16 grs.; rhubarb, 24 grs. For 12 pills. An excellent stomachic aperient.—*Dose.* 2 to 4.

Pills of Chiray'ta. *Syn.* DR. REECE'S PILLS; PILULÆ CHIRAYTÆ, L. *Prep.* From chirayta, 2 drs.; dried carbonate of soda, 20 grs.; powdered ginger (best), 15 grs.; divided into 36 pills.—*Dose.* 2, twice a day. In acidity, flatulence, and dyspepsia, especially when complicated with gout or debility.

Pills of Chloride of Barium. *Syn.* PILULÆ BARIÏ CHLORIDI, L. *Prep.* 1. (Pierquin.) Chloride of barium, 1 dr.; resin of guaiacum, 4 drs.; conserve of fumitory, q. s.; divided into 188 pills.—*Dose.* 1 pill, morning and evening, afterwards increased to 2; in tapeworm, and in the rheumatism of scrofulous subjects.

2. (Walsh.) Chloride of barium, 15 grs.; powdered marsh-mallow or liquorice root and mucilage of tragacanth, of each, q. s. to make 200 pills.—*Dose.* 3, gradually increased to 10 or 12, daily; in cancer, scrofula, goitre, syphilis, &c.

Obs. The above are very poisonous, and their exhibition demands great caution.

Pills of Chloride of Calcium. *Syn.* PILULÆ CALCII CHLORIDI, L. *Prep.* 1. As the last.

2. (Gräfe.) Chloride of calcium, 1 dr.; extract of opium, 10 grs.; mucilage, q. s. For 54 pills.—*Dose.* 1, every two or three hours, gradually increased until 10, or even 12, are taken every hour; in gonorrhœa, more especially when occurring in scrofulous subjects.

Pills of Chloride of Gold. *Syn.* PILULÆ AURI CHLORIDI, L. *Prep.* From tetrachloride of gold, 3 grs.; powdered liquorice, 1 dr.; syrup, q. s. For 48 pills.—*Dose.* 1 pill, twice or thrice daily. (See page 581.)

Pills of Chloride of Gold and Sodium. *Syn.* PILULÆ AURI ET SODII CHLORIDI, P. A. SODIO-CHLORIDI, L. *Prep.* (Magendie.) Soda-chloride of gold, 1 gr.; extract of mezereon, 2 drs.; divide into 60 pills. (See page 581.)

Pills of Chloride of Lime. *Syn.* PILLS OF CHLORINATED LIME; PILULÆ CALCIS HYPOCHLORITIS, L. *Prep.* 1. Chloride of lime, 12 grs.; starch powder, 24 grs.; conserve of hips, q. s.; divide into 36 pills.

2. (Dr. Copland.) Chloride of lime, 15 grs.; compound powder of tragacanth, 90 grs.; syrup, q. s. For 24 pills.—*Dose.* 1 to 3, twice or thrice daily; in various putrid affections, fevers, &c.

Pills of Chloride of Mercury†. Pills of calomel.

Pills, Chol'era. *Syn.* PILULÆ ANTICHOLE-RIÆ, L. *Prep.* Powdered camphor, 15 grs.; powdered capsicum (pure), $\frac{1}{2}$ dr.; bicarbonate of soda, 1 dr.; conserve of roses, q. s. For 36 pills.—*Dose.* 2 to 4, every 15 minutes, washed down with a wine-glassful of cold water containing half a teaspoonful of ether; repeated every 15 or 20 minutes, until reaction ensues. They should be freshly made.

Pills of Citrate of Iron and Quinine. *Syn.* PILULÆ FERRI CITRATIS CUM QUINÆ, L. *Prep.* From citrate of iron and quinine, 1 dr.; powdered citric acid, 20 grs.; conserve of hips, q. s. For 36 pills. An excellent tonic in debility, chlorosis, &c.—*Dose.* 1 to 3, twice or thrice daily.

Pills, Dr. Clark's. See DINNER PILLS.

Pills, Coindet's. See PILLS OF IODIDE OF MERCURY.

Pills of Col'chicum. See GOUT PILLS.

Pills of Colocynth. *Syn.* PILULÆ DIOBUS, P. EX COLOCYNTHIDIS SIMPLICIORIS, L. *Prep.* (Ph. L. 1746.) Colocynth and scammony, of each, 2 oz.; oil of cloves, 2 drs.; syrup of buckthorn, q. s. An active hydragogue cathartic.—*Dose.* 3 to 12 grs.

Pills of Colocynth (Compound). *Syn.* PILL OF COCHIA; PILULÆ COCCLE, P. COCCLE, PILULA COLOCYNTHIDIS COMPOSITA (B. P.), P. COLOCYNTHIDIS COMPOSITÆ (Ph. L. & D.), P. COLOCYNTHIDIS (Ph. E.), L. *Prep.* 1. (Ph. L.) Extract of colocynth (simple), 1 dr.; powdered extract of aloes, 6 drs.; powdered scammony, 2 drs.; powdered cardamoms, $\frac{1}{2}$ dr.; soft soap (Ph. L.), 1½ dr.; mix, and beat them altogether, so that a mass may be formed. This is intended as a substitute for the compound extract of colocynth of the Ph. L. 1836.

2. (Ph. E.) Socotrine or East Indian aloes and scammony, of each, 8 parts; sulphate of potassa, 1 part; beat them together; add of colocynth, in fine powder, 4 parts; next add of oil of cloves, 1 part; and, with the aid of a little rectified spirit, beat the whole to a mass, and divide this into 5-gr. pills.

3. (Ph. D.) Colocynth pulp, scammony, and Castile soap, of each (in powder), 1 oz.; hepatic aloes, 2 oz.; treacle, 10 drs.; oil of cloves, 1 fl. dr.; mix, and beat them into a mass of uniform consistence.

4. (Ph. L. 1746.) Socotrine aloes and scammony, of each, 2 oz.; pulp of colocynth, 1 oz.; oil of cloves, 2 drs.; syrup of buckthorn, q. s. to form a pill-mass. This is the original formula published by Galen for 'pilula cochiæ minores,' and, under various slight modifications, it has continued in use ever since.

5. Aloes, 1½ lb.; colocynth, $\frac{1}{2}$ lb.; jalap, 6

oz.; (all in powder;) oil of cloves, $1\frac{1}{2}$ oz.; syrup or treacle, q. s. to mix. *Prod.* About $4\frac{1}{2}$ lbs. This forms the common 'pil. coeliæ' of the druggists. A few, more conscientious than the rest, add to the above, scammony, 6 oz. It is greatly inferior to the Ph. pill.

6. (B. P.) Colocynth, in powder, 1; Barbadoes aloes, in powder, 2; scammony, in powder, 2; sulphate of potash, in powder, $\frac{1}{4}$; oil of cloves, $\frac{1}{4}$; distilled water, a sufficiency (about $\frac{1}{4}$); mix. Dr. Gregory's favourite pill.—*Dose.* 5 to 10 grs.

Obs. Compound colocynth pill is a cheap and excellent cathartic, more powerful than the other official aloetic pills, and well adapted to cases of habitual costiveness. It has long been extensively used by the poorer classes, and in domestic medicine generally.—*Dose.* 5 to 15 grs.

Pills of Colocynth and Henbane. *Syn.* PILULÆ COLOCYNTHIDIS ET HYOSCYAMI (B. P., Ph. E.), L. *Prep.* 1. (Ph. E.) Colocynth pill-mass, 2 parts; extract of henbane, 1 part; beat them up with a few drops of rectified spirit (if necessary), and divide them into 5-gr. pills.—*Dose.* 1 to 3 pills; as an anodyne purgative, in irritable bowels.

2. (B. P.) Colocynth, in powder, 1; Barbadoes aloes, in powder, 2; scammony, in powder, 2; sulphate of potash, in powder, $\frac{1}{4}$; oil of cloves, $\frac{1}{4}$; extract of hyoscyamus, 3; distilled water, a sufficiency: mix.—*Dose.* 5 to 10 grains.

Pills of Copai'ba. *Syn.* PILULÆ COPAIBÆ, L. *Prep.* (Ph. U. S.) Pure balsam of copai'ba, 2 oz.; recently prepared calcined magnesia, 1 dr.; mix thoroughly, then set the mixture aside until it acquires a pillular consistence, and, lastly, divide it into 200 pills.

Obs. Unless the magnesia has been very recently calcined, the copai'ba hardens very slowly or not at all. It is said that "lime produces the effect more completely and uniformly than magnesia," and that "specimens of copai'ba which are old and contain the most resin" harden quickest. (Redwood.) For present use, the quantity of magnesia may be at least doubled. Dr. Pereira orders copai'ba, 1 oz.; magnesia, 5 or 6 drs.—*Dose.* 10 to 30 grs., frequently; in diseases of the mucous membranes of the urinary organs. Cubebs are often added.

Pills, Dr. Copland's. See APERIENT AND PECTORAL PILLS.

Pills of Corrosive Sublimate. *Syn.* PILLS OF CHLORIDE OF MERCURY; P. OF BICHLORIDE OF M.†, HOFFMANN'S P.; PILULÆ SUBLIMATIS CORROSIVI, P. HYDRARGYRI BICHLORIDI†, P. MAJORES HOFFMANNI, L. *Prep.* 1. Corrosive sublimate, 3 grs.; white sugar, $\frac{1}{2}$ dr.; triturate together in a glass mortar for some time, then add of powdered gum arabic, 20 grs., and beat the whole to a mass with dilute hydrochloric acid, q. s. For 36 pills, each containing $\frac{1}{2}$ gr. of corrosive sublimate.

2. (Brera.) Corrosive sublimate, 3 grs.;

rectified spirit, the smallest possible quantity to dissolve it; bread-crum, q. s. to form a mass. For 24 pills, each containing $\frac{1}{2}$ gr. of the corrosive sublimate.

3. (Dr. Paris.) Corrosive sublimate and sal ammoniac, of each, 5 grs.; water, $\frac{1}{2}$ fl. dr.; triturate together until solution is complete, then add, of honey, $\frac{1}{2}$ dr., liquorice powder, 1 dr. (or, q. s.), and divide into 40 pills. Each pill contains $\frac{1}{2}$ gr. of corrosive sublimate.

4. (Ph. Hannov.) Corrosive sublimate, 15 grs.; distilled water, $\frac{1}{2}$ fl. dr.; crum of bread, q. s. to form a mass. For 120 pills, each containing $\frac{1}{8}$ gr.

Obs. The above formulæ are among those most usually employed. Other authorities order pills containing $\frac{1}{10}$ th of a gr. Dzondi orders $\frac{1}{10}$ gr., and Hüfeland only $\frac{1}{10}$ gr., in each pill. The commencing dose should not exceed 1 pill containing the $\frac{1}{10}$ of a grain, twice or thrice a day. It may afterwards be safely kept at $\frac{1}{8}$ th of a grain. They are chiefly employed in syphilis, but are also occasionally exhibited with great advantage in glandular indurations and enlargements, and in cancer; due caution being observed.

Pills, Cough. See PECTORAL PILLS, EXPECTORANT P., &c.

Pills of Creasote. *Syn.* PILULÆ CREASOTI, L. *Prep.* 1. (Pitschaft.) Creasote, 6 grs.; powdered henbane, 24 grs.; conserve of hips, q. s. For 24 pills.—*Dose.* 1, three times daily; in sea-sickness, the vomiting during pregnancy, &c.

2. (Rieche.) Creasote, 1 dr.; extract of liquorice and gum galbanum, of each, $\frac{1}{2}$ dr.; powdered mallow-root, 2 drs.; to be divided into 2-gr. pills.—*Dose.* 3 to 6, four times a day; in acute rheumatism, bronchitis, neuralgia, phthisis, &c.

Pills, Crespigny's. See DINNER PILLS.

Pills of Croton Oil. *Syn.* PILULÆ CROTONIS, P. TIGLI, L. *Prep.* 1. Croton oil, 3 drops; oil of cloves, 4 drops; bread-crum, q. s. For 3 pills, one of which is a dose.

2. (Dr. Copland.) Croton oil, 6 drops; pill of aloes and myrrh, $1\frac{1}{2}$ dr.; soap, 20 grs.; liquorice powder, q. s. For 30 pills.—*Dose.* 2 to 4.

3. (Dr. Reece.) Croton oil, 6 drops; Castile soap, $\frac{1}{2}$ dr.; oil of caraway, 8 drops; liquorice powder, q. s. For 12 pills.—*Dose.* 1 to 3. In dropsy, visceral obstructions, &c. See CROTON OIL.

4. (With MERCURY—Dr. Neligan.) Croton-oil soap, 3 grs.; extract of henbane and mercurial pill, of each, 24 grs.; oil of pimento, 12 drops; divide into 12 pills.—*Dose.* 2 at bedtime. (See above.)

Pills of Cy'anide of Mer'cury. *Syn.* PILULÆ HYDRARGYRI CYANIDI, P. H. CYANURETI, L. *Prep.* (Guibourt.) Cyanide of mercury, 6 grs.; opium, 12 grs.; bread-crum, 60 grs.; honey or syrup, q. s. For 96 pills.—*Dose.* 1, night and morning; in syphilis, chronic inflammation of the viscera, &c.

Pills of Cyanide of Potassium. *Syn.* PILULE POTASSII CYANIDI, L. *Prep.* (Golding Bird.) Cyanide of potassium, 2 grs.; arrow-root, 20 grs.; simple syrup, q. s. For 18 pills.—*Dose.* 1, twice or thrice a day; as a sedative, in hysteria, gastrodynia, extreme nervous excitability, &c. See DRAUGHT and MIXTURE.

Pills of Dandelion. See PILLS OF TARAXACUM.

Pills, De Haen's. *Prep.* (St. Marie.) Gum ammoniacum and pill aloes with myrrh, of each, 1 dr.; extract of hemlock and Castile soap, of each, 1½ dr. For 2-gr. pills.—*Dose.* 3 to 6 daily; in painful or obstructed menstruation, chlorosis, &c.

Pills of Delphinine. *Syn.* PILULE DELPHINIE, L. *Prep.* (Dr. Turnbull.) Delphinine, 1 gr.; extracts of henbane and liquorice, of each, 12 grs. For 12 pills.—*Dose.* 1 to 3, twice a day; in dropsy, gout, rheumatism, &c., instead of veratrine.

Pills, Diaphoretic. *Syn.* PILULE DIAPHORETICÆ, L. *Prep.* 1. Antimonial powder, ½ dr.; opium, 10 grs.; calomel, 5 grs.; confection of opium, q. s. to mix; divide into 10 pills.—*Dose.* 1, at bedtime; in coughs and bronchial irritability, after an aperient.

2. Guaiacum, 10 grs.; emetic tartar and opium, of each, 1 gr.; simple syrup, q. s. to mix; divide into 3 pills.—*Dose.* 1 to 2, in acute rheumatism, &c.

3. Camphor and antimonial powder, of each, ½ dr.; opium, 10 grs.; aromatic confection, q. s. to mix. For 12 pills. In fevers, and in some spasmodic diseases.—*Dose.* 1 pill.

4. Powdered guaiacum, 10 grs.; compound powder of ipecacuanha, 5 grs.; confection of roses, q. s. to mix; for a dose. As a diaphoretic, in inflammatory affections and rheumatism.

Pills, Diarrhoea. *Syn.* PILULE ANTIDIARRHEALES, L. *Prep.* (Trousseau & Reveil.) Soft extract of opium, 1½ gr.; calomel and powdered ipecacuanha, of each, 3 grs.; conserve of hips, q. s.; divide into 10 pills.—*Dose.* 1, two or three times daily; in chronic and choleraic diarrhoea.

Pills, Digestive. Under this head are generally classed all the stomachic and milder aperient pills. See BATH PILLS, DINNER PILLS, &c.

Pills of Digitaline. *Syn.* PILULE DIGITALINÆ, L. *Prep.* 1. Digitaline, 1 gr.; powdered sugar, ½ dr.; thick mucilage, q. s. For 24 pills.—*Dose.* 1 to 4 daily, watching the effects; as a sedative to reduce the force of the circulation, in phthisis, enlargement of the heart, &c. See FOXGLOVE PILLS.

Pills, Dinner. *Syn.* PILULE DICTÆ ANTECIBUM, L.; GRAINS DE SANTÉ, Fr. *Prep.* 1. Aloes, 1 dr.; rhubarb and extract of gentian, of each, ½ dr.; ipecacuanha and capsicum, of each, 12 grs.; syrup of ginger, q. s. to mix. For 3½-gr. pills.

2. (Dr. Baillie's.) See page 922.

3. (BATH DIGESTIVE PILLS.) See page 923.

4. (PILLS OF ALOES AND MASTIC; LADY CRESPIGNY'S PILLS, LADY HESKETH'S P., LADY WEBSTER'S P., DIGESTIVE P., STOMACH P., PILULE ALOËS ET MASTICES, P. A. CUM MASTICHE, P. STOMACHICÆ MESUES; GRAINS DE VIE, GRAINS DE MESUE.) From aloes (powdered), 6 drs.; powdered mastic and petals of red roses, of each, 2 drs.; syrup of wormwood, q. s. to form a pill-mass. For 3-gr. pills. In small doses, they excite the appetite; in larger ones, they produce a bulky and copious evacuation. This is the formula of the old Paris Codex. Rhubarb is now frequently substituted for the rose petals.

5. (Sir C. Bell's.) From sulphate of quinine, 4 grs.; mastic, 6 grs.; rhubarb, 50 grs.; syrup of orange peel, q. s. to mix. For 12 or, preferably, 18 pills.

6. (Sir Chas. Clarke's.) From extract of chamomile, ½ dr.; myrrh and rhubarb (in powder), of each, 20 grs.; powdered Socotrine aloes, 10 grs.; oil of chamomile, 8 drops; mucilage, q. s. to form 20 pills. "These pills, which were originally prescribed by Sir Chas. Clarke, are much used in London." (Redwood.)

7. (Frank's.) From aloes and jalap, of each, 4 parts; rhubarb, 1 part; syrup of wormwood, q. s. For 3-gr. pills.

8. (P. Cod.) Aloes, 6 drs.; extract of cinchona bark, 3 drs.; cinnamon, 1 dr.; syrup of wormwood, q. s.

The dose of the above is 3 to 5 grs., about an hour before dinner, to promote the appetite; or, as a purgative, 10 to 15 grs.

Pills, Diuretic. *Syn.* PILULE DIURETICÆ, L. *Prep.* 1. From powdered foxglove, 12 grs.; calomel, powdered squills, and opium, of each, 4 grs.; conserve of hips, q. s. For 12 pills.

2. (Dr. A. T. Thomson.) Mercurial pill, 1 dr.; powdered squills, 20 grs.; confection of roses, q. s.; divided into 20 pills. The dose of either of the above is 1 pill, twice or thrice daily; in dropsy, &c.

Pills, Dixon's. According to Dr. Paris, these pills consist of aloes, scammony, rhubarb, and a little tartar emetic, beaten up with syrup. "The following formula produces a pill precisely similar to this nostrum:—Take of compound extract of colocynth (Ph. L. 1836), 4 drs.; powdered rhubarb, 2 drs.; potassium-tartrate of antimony, 8 grs.; syrup of buckthorn, q. s.; mix, and divide into 120 pills. Aperient and diaphoretic.—*Dose.* 2 or 3, at bedtime." (Cooley.) Although a nostrum, it is really an excellent medicine, adapted for numerous cases.

Pills, Duchesne's. *Prep.* From aloes and gum ammoniacum, of each, 30 grs.; mastic and myrrh, 10 grs.; carbonate of potassa and saffron, of each, 3 grs.; syrup, q. s. In the dyspepsia of hysterical patients, in engorgements of the abdominal viscera, following intermittent fevers, &c.

Pills, Dys'entery. *Syn.* PILULÆ DYSENTERICÆ, L. *Prep.* Pure alumina and tannic acid, of each, 20 grs.; antimonial powder, 15 grs.; castor oil, $\frac{1}{2}$ dr.—*Dose.* 5 to 10 grs.; frequently.

Pills of Elaterium. *Syn.* PILULÆ ELATERII, L. *Prep.* (Radius.) Elaterium, 6 grs.; extract of gentian and Castile soap, of each, 9 grs.; mix, and divide into 12 pills.—*Dose.* 1 to 4; in obstinate constipation, and as a purge in dropsy, &c.

Pills, Emetic. *Syn.* PILULÆ EMETICÆ, P. CUPRI SULPHATIS COMPOSITÆ, L. *Prep.* (Swediaur.) Sulphate of copper and ipecacuanha, equal parts; syrup or conserve of roses, q. s. For 5-gr. pills.—*Dose.* 1 pill, repeated every 15 minutes, until vomiting comes on. See Emetics.

Pills, Epilepsy. *Syn.* PILULÆ ANTEREPILEPTICÆ, P. AD EPILEPSIAM, L. *Prep.* 1. (Griffith.) Powdered indigo, 75 grs.; assa-fœtida, 15 grs.; Russian castor, 7 grs.; mix, and divide the mass into 20 pills.—*Dose.* 1, every hour.

2. (Récamier.) Oxide of iron, 9 grs.; camphor and extract of belladonna, of each, 6 grs. For 12 pills.—*Dose.* 1 to 3, every 3 or 4 hours.

Pills of Ergot of Eye. *Syn.* PILULÆ ERGOTÆ, P. SECALIS CORNU, L. *Prep.* 1. (Dewees.) Powdered ergot, $\frac{1}{2}$ dr.; extract of gentian, 1 dr.; divide into 15 pills. In obstructed and painful menstruation, hæmorrhages, &c.—*Dose.* 1 pill, thrice daily.

2. (Lallemande.) Aloes, ergot, and rue, of each, 8 grs.; for 12 pills. As the last.

Pills of Ergotine. *Syn.* PILULÆ ERGOTINÆ, L. *Prep.* (Bonjean.) Ergotine (Bonjean's), 24 grs.; liquorice powder, 40 grs.; syrup, q. s. For 24 pills.—*Dose.* 3 to 6, daily; as an internal hæmostatic, &c.

Pills, Everlasting. *Syn.* PERPETUAL PILLS; PILULÆ ÆTERNÆ, P. PERPETUÆ, L. Small spheres of metallic antimony. They possess the property of purging as often as swallowed, but have now long fallen into disuse.

Pills, Expectoant. *Syn.* PILULÆ EXPECTORANTES, L. *Prep.* 1. Myrrh, $\frac{1}{2}$ dr.; powdered squills, $\frac{1}{2}$ dr.; extract of henbane, 2 drs.; syrup, q. s.; divide into 30 pills.—*Dose.* 2, night and morning.

2. (A. T. Thomson.) Powdered squills and extract of hemlock, of each, $\frac{1}{2}$ dr.; ammoniacum, $\frac{1}{2}$ dr.; divide into 30 pills. *Dose.* 2, twice or thrice a day. In chronic coughs, asthma, &c., after an aperient. See PECTORAL PILLS, &c.

Pills, Family Antibilious. *Syn.* ALOE PILLS; ALOES ROSATA, PILULÆ ALOES ROSATÆ, L. *Prep.* Socotrine or hepatic aloes, 3 oz.; juice of roses, 1 pint; dissolve by heat, strain through a piece of coarse flannel, evaporate to a proper consistence, and form it into pills. Purgative, in doses of 5 to 15 grs.

Pills, Fe'ber. *Syn.* PILULÆ FEBRIFUGÆ, L. Of these, the principal are those containing

antimonials, bark, quinine, and salicine (which see).

Pills, Fordyce's. An active purgative, closely resembling in composition the compound gamboge pill of the Ph. L.

Pills, Dr. Fothergill's. *Prep.* (Cooley.) Aloes, 4 drs.; extract of colocynth and scammony, of each, 1 dr.; diaphoretic antimony, 30 grs.; syrup, q. s. For 3½-gr. pills. A diaphoretic aperient.—*Dose.* 1 to 4 pills, at bedtime.

Pills of Foxglove and Henbane. *Syn.* PILULÆ DIGITALIS ET HYOSCYAMI, L. *Prep.* (Dr. A. T. Thomson.) Powdered foxglove, 4 grs.; powdered camphor, 12 grs.; extract of henbane, 18 grs. For 6 pills.—*Dose.* 1 or 2, at bedtime; as a sedative in maniacal and spasmodic affections, &c.

Pills of Foxglove and Squills. *Syn.* PILULÆ DIGITALIS ET SCILLÆ (Ph. E.), L. *Prep.* (Ph. E.) Powdered foxglove and squills, of each, 1 part; aromatic electuary (Ph. E.), 2 parts; conserve of red roses, q. s.; divide into 4-gr. pills. A valuable diuretic in dropsies. *Dose.* 1 to 2 pills.

Pills, Frank's. See DINNER PILLS.
Pills, Frankfurt. These are the Pilules Angeliqes noticed among PATENT MEDICINES, formed into 2-gr. pills, and silvered.

Pills of Fuligokali. *Syn.* PILULÆ FULIGOKALI, L. *Prep.* (Deschamps.) Fuligokali, 5 dr.; starch, 2½ dr.; powdered tragacanth, 10 grs.; syrup, q. s. For 100 pills, which must be covered with 2 or 3 coats of gum, and preserved from the air. The pills of sulphuretted fuligokal (Pilulæ Fuligokali Sulphurati) are prepared in a similar manner.

Pills, Fuller's. *Syn.* BENNETT PILLS; PILULÆ BENEDICTÆ, L. *Prep.* (Cooley.) Aloes and sulphate of iron, of each, $\frac{1}{2}$ dr.; myrrh and senna, of each, 20 grs.; assa-fœtida and galbanum, of each, 10 grs.; mace and saffron, of each, 6 grs.; syrup, q. s.; mix and divide into 4-gr. pills. Antispasmodic, emmenagogue, and tonic, and slightly aperient.—*Dose.* 1 to 4, according to the object in view.

Pills, Gairthorn's Mild Provis'ional. *Prep.* (Cooley.) Compound gamboge pill, 60 grs.; aqueous extract of aloes, 40 grs.; sulphate of potassa and extract of senna, 30 grs.; compound scammony powder, 15 grs.; balsam of Peru, 6 or 8 grs.; emetic tartar, 3 grs.; mix, and divide into 36 pills. Purgative.—*Dose.* 1, 2, or more, when required.

Pills of Galbanum (Compound). *Syn.* PILULÆ GALBANI COMPOSITÆ (Ph. L.), PILULÆ G. COMPOSITÆ, L. *Prep.* 1. (Ph. L.) Myrrh and prepared sagapenum, of each, 3 drs.; prepared galbanum and soft soap, of each, 2 drs.; prepared assa-fœtida, 1 dr.; treacle, q. s. to form a pill-mass.

2. (Ph. L. 1836.) As the last, omitting the soap.

3. (Ph. D. 1826.) As the Ph. L., except that treacle is substituted for syrup.

Obs. These pills are stimulant, expectorant

antispasmodic, and emmenagogue.—*Dose.* 10 to 20 grs.; in hysteria, chronic coughs, chlorosis, amenorrhœa, &c.

Pills of Galbanum with Iron. *Syn.* PILULÆ GALBANI CUM FERRO, L. *Prep.* (Guy's Hosp.) Compound galbanum pill, 2 parts; precipitated sesquioxide of iron, 1 part; water, q. s. to form a mass. For 4½-gr. pills. An excellent tonic emmenagogue.—*Dose.* 10 to 20 grs.; in chlorosis, amenorrhœa, &c., when chalybeates are not contra-indicated.

Pills of Gamboge (Compound). *Syn.* GAMBOGE PILLS, FORDYCE'S P.; PILULÆ GAMBOGLE COMPOSITA (Ph. L.), P. CAMBOGLE (Ph. E.), L. *Prep.* 1. (Ph. L.) Powdered Socotrine or hepatic aloes, 3 drs.; powdered gamboge, 2 drs.; powdered ginger, 1 dr.; soft soap (Ph. L.), 4 drs.; mix, and beat them to a pill-mass. The formulae of the Ph. L. 1836 and Ph. D. 1826 are precisely similar.

2. (Ph. E.) Gamboge, East Indian or Barbadoes aloes, and aromatic powder, of each (in powder), 1 part; Castile soap, 2 parts; syrup, q. s.

Obs. Both the above are active cathartics.—*Dose.* 5 to 15 grs., at bedtime; in obstinate constipation, &c.

Pills of Gen'tian (Compound). *Syn.* PILULÆ GENTIANÆ COMPOSITÆ, L. *Prep.* (W. Cooley.) Extract of gentian, 1 dr.; powdered rhubarb and cardamoms, of each, ½ dr.; ipecacuanha, 12 grs. For 3-gr. pills. Stomachic.—*Dose.* 2 or 3, twice or thrice daily, to improve the appetite and digestion.

Pills, Gout. *Syn.* PILULÆ ANTARTHRITICÆ, L. *Prep.* 1. (Bouchardat.) Extract of colchicum and compound extract of colocynth, of each, 1 dr.; aqueous extract of opium, 3 grs.; mix, and divide into 3-gr. pills.—*Dose.* 1 or 2, according to their purgative action, as required.

2. (Sir H. Halford's.) From acetic extract of colchicum, ½ dr.; Dover's powder and compound extract of colocynth, of each, 18 grs. For 12 pills.—*Dose.* 1 pill.

3. (Lartigue's.) From compound extract of colocynth, 20 grs.; alcoholic extract of colchicum seeds and alcoholic extract of digitalis, of each, 1 gr. For 2-gr. pills.—*Dose.* 4 or 5. As the last.

4. (St. George's Hosp.) Acetic extract of colchicum, 12 grs.; Dover's powder, 30 grs. For 12 pills.—*Dose.* 2 pills.

5. (Sir C. Scudamore's.) From acetic extract of colchicum, 1 dr.; powdered marsh-mallow root, q. s. to form a mass. For 40 pills.—*Dose.* 1 to 3, or more, with caution, as required.

6. (Trousseau & Réveil.) Powdered colchicum seeds, ½ dr.; powdered digitalis and sulphate of quinine, of each, 15 grs.; calomel and extract of colocynth, of each, 8 grs.; syrup, q. s. For 20 pills.—*Dose.* 1 to 4, during the day, at the commencement of an attack of gout. Other formulae for gout pills will be found under the respective names.

Pills, Dr. Griffith's. Powdered rhubarb, 1½ dr.; sulphate of iron, ½ dr.; Castile soap, 40 grs.; water, q. s. to form a mass, For 48 pills. An excellent remedy in costiveness, with loss of tone of the bowels.—*Dose.* 2 to 4, at bedtime.

Pills of Guaiacum (Compound). *Syn.* PILULÆ GUALACI COMPOSITÆ, L. *Prep.* 1. Powdered resin of guaiacum, 1 dr.; oxysulphide of antimony, 40 grs.; oil of cajuput, 12 drops; extract of gentian, q. s. to form a mass. For 4-gr. pills.—*Dose.* 3 to 6, thrice daily; in gout, rheumatism, secondary syphilis, various obstinate cutaneous affections, &c.

2. (St. B. Hosp.) Guaiacum, 30 grs.; ipecacuanha and opium, of each, 3 grs.; syrup, q. s. For 12 pills.—*Dose.* 1 to 3. As the last.

Pills, Halford's. See GOUT PILLS.

Pills, Dr. Hamilton's. The same as the colocynth and henbane pill of the Ph. E. The compound pills of gamboge, now vended under the title of 'MORISON'S NO. 2 PILLS,' were long known in Scotland as Dr. Hamilton's Pills.

Pills, Head'ache. *Syn.* CEPHALIC PILLS; PILULÆ CEPHALICÆ, P. ANTICEPHALALGICÆ, L. *Prep.* 1. Caffeine, 15 grs.; aloes, 20 grs.; conserve of hips, q. s. For 12 pills.—*Dose.* 1, occasionally; when only one side of the head is affected.

2. (Broussais.) Extract of opium, 6 grs.; extracts of belladonna and henbane, of each, 15 grs.; extract of lettuce 30 grs.; butter of cacao, 4 drs. For 120 pills.—*Dose.* 1, twice or thrice daily; in headache, accompanying spasmodic affections, &c.

3. (Dr. Wilson Philip.) Powdered nutmeg and rhubarb, of each, 20 grs.; extract of chamomile, 20 grs.; oil of peppermint, 10 or 12 drops. For 30 pills.—*Dose.* 1 to 3, thrice daily; in nervous headaches.

Pills, Helvetius's. *Syn.* PILULÆ ALUMINIS HELVETII, L. *Prep.* Alum, 2 drs.; dragon's blood, 1 dr.; honey of roses, to mix. For 48 pills. Astringent.

Pills of Hemlock (Compound). *Syn.* PILULA CONII COMPOSITA (B. P., Ph. L.), L. *Prep.* (Ph. L.) Extract of hemlock, 5 drs.; powdered ipecacuanha, 1 dr.; treacle, q. s. Antispasmodic, expectorant, and narcotic.—*Dose.* 4 to 8 grs. (B. P. 5 to 10 grs.), twice or thrice daily; in whooping-cough, bronchitis, incipient phthisis, &c.

Pills of Henbane (Compound). *Syn.* PILULÆ HYOSCYAMI ET ZINCI, L.; PILULES DE MEGLIN, Fr. *Prep.* (P. Cod.) Extracts of henbane and valerian, and oxide of zinc, equal parts. For 3-gr. pills.—*Dose.* 1 to 10; as an anodyne or sedative in neuralgia, nervous attacks, &c.

Pills, Lady Hesketh's. See DINNER PILLS.

Pills, Hoffmann's. See PILLS OF CORROSIVE SUBLIMATE.

Pills, Holloway's. See PATENT MEDICINES.

Pills, Hooper's Female. *Prep.* 1. (Gray.) Sulphate of iron and water, of each, 8 oz.;

dissolve, add, Barbadoes aloes, $2\frac{1}{2}$ lbs.; white canella, 6 oz.; myrrh, 2 oz.; opopanax, 1 oz.

2. (Phil. Coll. of Pharm.) Barbadoes aloes, 8 oz.; dried sulphate of iron, $2\frac{1}{2}$ oz.; myrrh, extract of black hellebore, and Castile soap, of each, 2 oz.; canella and ginger, of each, 1 oz.; water, q. s.; divide the mass into $2\frac{1}{2}$ - or 3-gr. pills, and put 40 into each box. Cathartic and emmenagogue. —*Dose*. 2, or more. "If we omit the soap, lessen the quantity of extract of hellebore, and increase that of the aloes, we think the form will be nearer that of the original." (Cooley.)

Pills, Humphrey's. See PECTORAL PILLS.

Pills, Hunter's. See RENAL PILLS.

Pills, Hydragogue. See BONTIUS'S PILLS, &c.

Pills, Hydrophobia. *Syn.* PILULÆ AD RABIEŒM, L. *Prep.* (Werlhoff.) Cantharides (in very fine powder), 2 grs.; belladonna and calomel, of each, 4 grs.; camphor, 8 grs.; mucilage, q. s. For 12 pills. —*Dose*. 2 to 3, twice daily.

Pills of Indian Hemp. *Syn.* PILULÆ CANNABIS INDICÆ, L. *Prep.* From alcoholic extract of Indian hemp, $\frac{1}{2}$ dr.; sugar of milk, 1 dr.; mucilage, q. s. For 48 pills. An excellent pill for soothing pain and quieting the system, acting without causing headache or constipation of the bowels. —*Dose*. 1 pill, increased to 2 or more, as necessary. (See page 602.)

Pills of Indigo. See EPILEPSY PILLS.

Pills of Iodide of Arsenic. *Syn.* PILULÆ ARSENICI IODIDI, L. *Prep.* 1. (Dr. Neligan.) Iodide of arsenic, 2 grs.; menna, 40 grs.; mucilage, q. s.; mix, and divide into 20 pills.

2. (Gardiner.) Iodide of arsenic, 1 gr.; extract of hemlock, 20 grs. For 12 pills. —*Dose*. 1 pill, twice or thrice daily; in lepra, psoriasis, and some other scaly skin diseases.

Pills of Iodide of Iron. *Syn.* PILULÆ FERRI IODIDI, L. *Prep.* 1. Unoxidized iron filings (recently levigated), 20 grs.; iodine, 40 grs.; distilled water, $\frac{1}{2}$ dr.; mix in a cold wedge-wood-ware mortar, and triturate them together until the red colour of the mixture has entirely disappeared; then add, of powdered gum, 20 grs.; powdered sugar, 1 dr.; liquorice powder, q. s. to form a mass, and divide it into 48 pills. Each pill contains 1 gr. of dry iodide of iron. —*Dose*. 1 to 6 pills, twice or thrice a day.

2. (Ph. U. S.) Protosulphate of iron, 60 grs.; iodide of potassium, 80 grs.; (both in fine powder;) mix, add of powdered tragacanth, 10 grs.; powdered sugar, 30 grs.; and form the whole into a mass with syrup, q. s. For 40 pills. Each pill contains nearly 2 grs. of the dry iodide, or about $2\frac{1}{2}$ grs. of the common hydrated iodide of the shops. —*Dose*. 1 to 3, as the last.

Obs. The above pills are reputed alterative, tonic, and emmenagogue, and are found peculiarly useful in indurations, scrofula, chlorosis, leucorrhœa, &c., when the administration of chalybeates is not contraindicated.

Pills of Iodide of Lead. *Syn.* PILULÆ PLUMBI IODIDI, L. *Prep.* From iodide of lead, 15 grs.; powdered sugar, $1\frac{1}{2}$ dr.; mucilage, q. s. For 60 pills. —*Dose*. 1 pill, gradually increased to 3, or more, twice a day; in scrofula, scirrhus, &c. (See page 684.)

Pills of Iodide of Mercury. *Syn.* PILULÆ HYDRARGYRI IODIDI, L. *Prep.* 1. (Ph. L. 1836.) Green iodide of mercury and powdered ginger, of each, 1 dr.; conserve of hips, 3 drs. —*Dose*. 2 to 5 grs., twice or thrice daily, as an alterative in scrofula and scrofulous syphilis, &c.

2. (COINDET'S PILLS.) From green iodide of mercury, 1 gr.; extract of liquorice, 20 grs.; mix, and divide into 8 pills. —*Dose*. 2 to 4, as the last. Pills of red iodide of mercury are made in the same way, but, owing to its greater activity, only one fourth of the above quantity of iodide must enter into their composition.

Pills of Iodide of Potassium. *Syn.* PILULÆ POTASSII IODIDI, L. *Prep.* 1. Iodide of potassium and powdered starch, of each, $\frac{1}{2}$ dr.; conserve of hips, q. s. For 36 pills. —*Dose*. 1 to 6, thrice daily; in glandular indurations and enlargements, goitre, scrofula, &c.

2. (Voght.) Iodide of potassium, 15 grs.; burnt sponge and extract of dulcamara, of each, 5 drs.; water, q. s. For 180 pills. —*Dose*. 4 to 6, twice a day; as the last.

Pills of Iodine. *Syn.* PILULÆ IODINI, L. *Prep.* (Radius.) Iodine, 6 grs.; extract of gentian, 1 dr.; powdered gum, q. s. For 24 pills. —*Dose*. 1 to 3; in scrofula, &c.; also, in mercurial and scorbutic salivation.

Pills of Iodoform. *Syn.* PILULÆ IODOFORMI, L. *Prep.* (Bouchardat.) Iodoform, $\frac{1}{2}$ dr.; extract of wormwood (or gentian), 1 dr.; mix, and divide into 36 pills. —*Dose*. 1, twice or thrice daily; in scrofula, &c.

Pills of Ipecacuanha (Compound). *Syn.* PILULÆ OF IPECACUANHA WITH SQUILLS, P. OF I. AND OPIUM; PILULA IPECACUANHÆ CUM SCILLÆ (Ph. L.), P. IPECACUANHÆ ET OPII (Ph. E.), L. *Prep.* 1. (Ph. L.) Compound powder of ipecacuanha (Dover's powder), 3 drs.; powdered ammoniacum and squills (freshly powdered), of each, 1 dr.; treacle, q. s. to form a pill-mass. Anodyne, sudorific, and expectorant. —*Dose*. 5 to 16 grs.; in chronic coughs and asthma, &c.

2. (Ph. E.) Dover's powder, 3 parts; conserve of red roses, 1 part; mix, and divide into 4-gr. pills. Resembles Dover's powder in its effects. It is hence regarded by many as a useless preparation.

Pills of Iron (Compound). *Syn.* PILULA FERRI COMPOSITA (Ph. L.), P. F. CUM MYRRHÆ, L. *Prep.* (Ph. L.) Myrrh (in powder), 2 drs.; carbonate of soda, 1 dr.; rub them together in a warm mortar, then add of sulphate of iron, 1 dr., and again triturate; lastly, add of treacle, 1 dr., and beat all together, to form a pill-mass. An excellent mild chalybeate tonic and emmenagogue, similar in its properties to

'Griffith's Mixture.'—*Dose.* 5 to 15 grs., two or three times a day.

Pills, Italian Black. *Syn.* *PILULÆ ITALICÆ NIGRÆ*, P. ALOETICÆ FERRATÆ, L. *Prep.* (Ph. Bor.) Powdered aloes and dried sulphate of iron, equal parts; beaten up with rectified spirit, q. s., and divided into 2- or 2½-gr. pills. See PILLS OF ALOES AND IRON.

Pills of Jalap. *Syn.* *PILULÆ JALAPÆ*, L. *Prep.* 1. (Ph. E. 1783.) Extract of jalap, 2 drs.; aromatic powder, 1 dr.; syrup, q. s.

2. (Ph. Bor.) Soap of jalap, 3 parts; powdered jalap, 1 part; beat them to a pill-mass.—*Dose.* (Of either) 10 to 15 grs.

Pills, James's Analeptic. *Prep.* 1. Antimonial powder, guaiacum, and pill of aloes with myrrh, equal parts; syrup, q. s.

2. (Cooley.) Antimonial powder (James's), pill aloes with myrrh, and compound aloes powder, of each, 2 parts; powdered ammoniacum, 1 part; beaten up with tincture of castor, q. s., and divided into 3½-gr. pills. A diaphoretic purge.—*Dose.* 2 to 4 pills.

Pills, Dr. J. Johnson's. *Prep.* From compound extract of colocynth, 2 drs.; calomel, ½ dr.; potassia-tartrate of antimony, 2 grs.; oil of cassia, 12 drops. For 4 dozen pills. An excellent alternative and diaphoretic aperient.—*Dose.* 1 to 3 pills.

Pills, Kaye's. See WORDSWORTH'S PILLS.

Pills, Keyser's. *Prep.* (Guilbort.) Red oxide of mercury, 1½ oz.; distilled vinegar (dilute acetic acid), 1 pint; dissolve, add to the resulting solution, manna, 2 lbs., and triturate for a long time before the fire, until a proper consistence is attained; lastly, divide the mass into pills of 1½ gr. each.

Obs. Keyser's pills were once celebrated throughout Europe as a remedy possessing extraordinary virtues, and so highly were they prized that the method of preparing them was purchased by the French government for the benefit of the nation. Richard, who first published a full account of them, concludes by observing that he considers this compound to be, without exception, the most effectual remedy for syphilis hitherto discovered. In this country, however, it has long sunk into comparative disuse with the faculty; probably from pills of acetate of suboxide of mercury being erroneously employed under the name, whereas according to Robiquet, acetate of protoxide of mercury (called by him the 'peroxide') forms the basis of the original preparation. The *dose* is 1 to 2, night and morning, as an alternative; and 2 to 6, twice a day, as a sialogogue. (See page 753.)

Pills, King's. See PATENT MEDICINES.

Pills, Kitchener's. *Syn.* DR. KITCHENER'S PERISTALTIC PERSUADERS; *PILULÆ RHÆI ET CÆUI*, L. *Prep.* From powdered Turkey rhubarb, 2 drs.; simple syrup, 1 dr.; oil of caraway, 10 or 12 drops. For 40 pills. An admirable stomachic, dinner, or laxative pill, according to the quantity taken.—*Dose.* 2 to 6. "From 2 to 4 will generally produce one addi-

tional motion within 12 hours. The best time to take them is early in the morning."

Pills, Klein's. *Prep.* From ammoniacum and extract of centaury, of each, ½ dr.; Castile soap, 1 dr.; oil of amber, 3 drops. For 2-gr. pills. Stomachic, emmenagogue, and pectoral.—*Dose.* 2 to 6 pills.

Pills of Lactate of Iron. *Syn.* *PILULÆ FERRI LACTATIS*, L. *Prep.* (Cap.) Lactate of protoxide of iron and powdered marsh-mallow root, equal parts; clarified honey, q. s. For 3-gr. pills. One of the most valuable of the chalybeates.—*Dose.* 1 to 2, three or four times a day.

Pills of Lactuca'rium. *Syn.* *PILULÆ LACTUCARIÆ*, L. *Prep.* 1. (Berca.) Lactucarium, 18 grs.; conserve of elder-berries and extract of liquorice, of each, q. s. For 12 pills.—*Dose.* 1 to 2 pills, every three or four hours; in dry asthma, obstinate coughs without expectoration, &c.

2. (Dr. Duncan.) Lactucarium, 12 grs.; liquorice powder, 20 grs.; simple syrup, q. s. For 12 pills.—*Dose.* 1 to 2 pills, every hour, as an anodyne, or to induce sleep.

Pills, Lartigue's. See GOVT PILLS.

Pills of Lead. *Prep.* 1. See PILLS OF ACETATE OF LEAD.

2. (Opiated; *PILULÆ PLUMBI OPIATÆ*—Ph. E.; *PILULÆ PLUMBI CUM OPIO*—B. P.) Acetate of lead, 6 parts; opium, 1 part; conserve of red roses, about 1 part; beat them to a proper mass, and divide this into 4-gr. pills. "This pill may also be made with twice the quantity of opium." In hæmorrhages, obstinate diarrhoea, dysentery, spitting of blood, and other cases demanding the use of a powerful astringent. It has also been highly extolled in cholera.—*Dose.* 1 to, 3 pills, twice or thrice daily, washed down with water soured with pure vinegar.

Pills, Lee's Antibilious. *Prep.* ('Amer. Journ. of Pharm.') Aloes, 12 oz.; scammony, 6 oz.; calomel, 5 oz.; gamboge, 4 oz.; jalap, 3 oz.; Castile soap and syrup of buckthorn, of each, 1 oz.; mucilage, 7 oz.; beat them together, and divide the mass into 5-gr. pills. A powerful cathartic, and, from containing mercury, not adapted for frequent use. See WYNDEHAM'S PILLS.

Pills, Lewis's Alterative and Liver. These "for the most part resemble SCOTT'S BILIOUS AND LIVER PILLS. They are, however, of a more drastic and powerful character, and frequently operate with considerable violence."

Pills, Lockstadt's. (Phæbus.) Sulphate of quinine, 3 grs.; aromatic powder, 10 grs.; essential oil of almonds, 1 drop; extract of gentian, q. s. For 10 pills.—*Dose.* 1 to 2, thrice daily, as a stomachic tonic; or the whole at once, before an expected attack of an ague or intermittent.

Pills, Lockyer's. *Prep.* From panacea of antimony, 6 grs.; powdered white sugar, 4 drs.; mucilage, q. s. For 48 pills. Cathartic and emetic.—*Dose.* 1 to 4 pills.

Pills, Dr. Lynn's. *Prep.* From pill of aloes with myrrh and compound extract of colocynth, of each, 1 dr.; calomel, $\frac{1}{2}$ dr. For 4 dozen pills. Aperient and antibilious.—*Dose.* 1 to 3; in costiveness, biliousness, &c.

Pills of Man'ganeſe. These are chiefly prepared from the recently precipitated carbonate (PILULE MANGANESEI CARBONATIS), the iodide (P. M. IODIDI), the chloride (P. M. CHLORIDI), the phosphate (P. M. PHOSPHATIS), the sulphate (P. M. SULPHATIS), and the double sulphate of manganese and iron (P. M. ET FERRI SULPHATIS). The best excipients are conserve of roses or of hips and liquorice powder. See MANGANESE and its salts.

Pills, Mar'tial. *Syn.* PILLS OF IRON AND WORMWOOD; PILULE FERRI CUM ABSINTHIO, P. MARTIALES, L. *Prep.* (Sydenham.) Levigated iron-filings, 1 dr.; extract of wormwood, q. s. Tonic and hæmatinic.—*Dose.* 5 to 10 grs., twice a day.

Pills, Matthew's. *Syn.* PILULE MATTHEI, P. PACIFICÆ, L. *Prep.* 1. (Dr. Paris.) Black hellebore, Castile soap, liquorice, opium, saffron, and turmeric, equal parts; made into pills with oil of turpentine.

2. (Ph. E. 1744.) Opium and saffron, of each, 1 dr.; castor, 2 drs.; soap of turpentine, 3 drs.; balsam of copaiba (or oil of turpentine), q. s. to form a mass. Alternative and anodyne.—*Dose.* 3 to 10 grs.

Pills, McKinsey's. See MCKINSEY'S KATAPOTIA, among PATENT MEDICINES.

Pills, Meglin's. *Syn.* PILULES DE MEGLIN, Fr. See PILLS OF HENBANE (Compound).

Pills, Mercu'rial. *Syn.* BLUE PILL; PILULA HYDRARGYRI (B. P.), PILULE HYDRARGYRI (Ph. L.), PILULÆ H. (Ph. E. & D.), P. MERCURIALES, L.; PILULE MERCURIELLES, Fr. *Prep.* 1. (Ph. L.) Mercury, 4 drs.; confection of roses, 6 drs.; rub them together until globules can no longer be seen; then add of liquorice, powder, 2 drs., and beat the whole together, so that a proper mass may be formed.

2. (Ph. E.) As the last; afterwards dividing the mass into 5-gr. pills.

3. (Ph. D.) As the Ph. L. formula, but taking four times the quantity of the respective ingredients.

4. (B. P.) Mercury, 2; confection of roses, 3; decorticated liquorice root, in fine powder, 1; rub the mercury with the confection of roses until metallic globules are no longer visible, then add the liquorice, and mix the whole well together.—*Dose.* 3 to 6 grs. as an alternative, 10 grs. as a purgative.

Obs. The remarks under 'MERCURIAL OINTMENT' (page 850), for the most part, also apply here. This pill, when properly prepared, presents no globules of mercury when moderately rubbed on a piece of white paper, and immediately communicates a white stain to a piece of bright gold or copper. It possesses considerable density, and has a dark blue or slate

colour. It contains 1-3rd of its weight of mercury, which may be ascertained from its sp. gr.; or, more exactly, by an assay for the metal. It is the mildest and the most extensively used of all the mercurial preparations.—*Dose.* As an alterative, 1 to 3 grs.; as a purgative, 10 to 15 grs.; and as a sialogogue, 5 or 6 grs., or more, twice or thrice daily. To prevent it affecting the bowels, it is commonly combined with either rhubarb or opium. A blue pill taken over-night, and a black draught in the morning, is a popular remedy in bilious complaints. See ABERNETHY MEDICINES.

4. (Collier.) Mercury, 2 drs.; sesquioxide of iron, 1 dr.; confection of red roses, 3 drs.; triturated, as before, until the globules disappear. An excellent extemporaneous substitute for the common mercurial pill. The addition of only a few grs. of the sesquioxide of iron to 1 oz. of conserve, renders the latter capable of rapidly killing a large quantity of quicksilver.

5. (Tyson.) Gray oxide of mercury (prepared by decomposing calomel with liquor of potassa to which a little liquor of ammonia has been added), 2 drs.; confection of roses, 6 drs.; powdered chamomiles, 1 dr.; mix. As a substitute for the College pill.

6. ('Pharm. Journ.') Stearin, 1 dr.; rub it in a warm mortar till it assumes the consistency of thick cream, then add of mercury, 4 drs., and again triturate until the globules disappear; next further add, of confection of roses and wheaten flour, of each, 3 drs., powdered gum, 1 dr., and form the whole into a pill-mass. As a substitute for the College pill.

7. (PILULE HYDRARGYROSE—P. Cod.) Mercury and honey, of each, 6 drs.; triturate till the globules are extinguished, then add of aloes, 6 drs.; rhubarb, 3 drs.; scammony, 2 drs.; black pepper, 1 dr.; and make a pill-mass as before. Contains 1-4th part of quicksilver. Alternative and aperient.—*Dose.* 5 to 10 grs. BELLOSTE'S, BARBAROSSA'S, SÉDILLOT'S, and MORELOT'S PILLS, are nearly similar compounds. See PILLS OF CALOMEL and CORROSIVE SUBLIMATE, &c.

Pills, Mercurial (Arabic). *Syn.* PILULE MERCURIALES ARABICÆ, L. *Prep.* Take of quicksilver and corrosive sublimate, of each, $\frac{1}{2}$ dr.; triturate them patiently together until the globules disappear; then add, of agaric, pellitory, and senna, of each, 1 dr.; honey, q. s. to make a pill-mass. For $3\frac{1}{2}$ -gr. pills.—*Dose.* 2 a day. Employed in the 'traitement arabique' for the cure of obstinate cutaneous diseases.

Pills, Mitchell's. *Prep.* Aloes, $\frac{1}{2}$ dr.; rhubarb, 1 dr.; calomel, 6 grs.; emetic tartar, 2 grs. For 36 pills. An alterative aperient.—*Dose.* 2 to 4 pills.

Pills, Moat's. Similar to MORISON'S PILLS. **Pills, Morison's.** *Prep.*—a. (No. 1 Pills.) From aloes and cream of tartar, equal parts,

made into a mass with either syrup or mucilage. A mild aperient.

b. (No. 2 pills.) From colocynth, 1 part; gamboge, 2 parts; aloes, 3 parts; and cream of tartar, 4 parts; made into a mass with syrup, as the last. An active purgative, often acting with great violence. Both No. 1 and No. 2 are divided into 3-gr. pills, of which 4 dozen are put into each thirteen-penny-half-penny box. The proper dose of either is 1 to 3 or 4 pills; but they are often given by the Morisons in doses of 12, 20, 30, or even more, daily. For the history of these pills and their proprietors, see 'Anat. of Quackery,' or 'Med. Circ.,' ii, 9-27.

Pills of Morphia. *Syn.* PILULÆ MORPHIÆ, L. *Prep.* (Magendic.) Morphine, 1 gr.; conserve of roses (stiff), q. s. For 6 (or, better, 8) pills.—*Dose.* 1 pill; as an anodyne or soporific.

Pills, Moseley's. *Prep.* Finest Turkey rhubarb, 60 grs.; Jamaica ginger, 30 grs.; sugar, 20 grs.; (all in powder;) tincture of rhubarb, q. s. to form a mass. For 4-gr. pills. A mild and excellent medicine, closely resembling KITCHENER'S PERISTALTIC PERSUADERS.

Pills of Musk. *Syn.* PILULÆ MOSCHI, L. *Prep.* (Dupuytren.) Opium, 2 grs.; musk (genuine), 8 grs.; camphor (in powder), 24 grs.; syrup, q. s. For 8 pills. Antispasmodic and stimulant.—*Dose.* 1 to 3, thrice daily, in low nervous affections; or the whole during the day, in hospital gangrene, &c.

Pills of Myrrh. See PILLS OF ALOES AND MYRRH.

Pills, Napier's Neurotonic. Of these, like MORISON'S PILLS, there are No. 1 and No. 2. The first is a simple stomachic aperient; the other, a stimulant tonic. They both owe their sale and reputed virtues to extensive advertising. ('Anat. of Quackery.')

Pills, Napoleon's. See PECTORAL PILLS.

Pills, Neuralgia. *Syn.* PILULÆ ANTINEURALGICÆ, L. *Prep.* 1. (Marchal De Calvi.) Aqueous extract of opium, 4 grs.; sulphate of quinine, 16 grs.; powdered cinnamon, powdered orange leaves, and extract of valerian, of each, 20 grs.; syrup of belladonna, q. s. For 3 dozen pills.—*Dose.* 1, hourly.

2. (Trousseau & Reveil.) Extracts of opium and stramonium, of each, 8 grs.; oxide of zinc, 2 drs.; syrup, q. s. For 40 pills.—*Dose.* 1, every two or three hours, gradually increased in frequency until there is some considerable disorder of vision, &c. Both of the above should be used with care. See MEGLIN'S PILLS, &c.

Pills of Nitrate of Bismuth. *Syn.* PILULÆ BISMUTHI TRISNITRATIS, L. *Prep.* From trisnitate of bismuth and powdered rhubarb, equal parts; syrup of orange peel, q. s. to form a mass. For 3-gr. pills.—*Dose.* 1 to 2, every two hours; as a tonic, stomachic, and antispasmodic, in dyspepsia, debility, spasms, &c.

Pills of Nitrate of Silver. *Syn.* PILULÆ ARGENTI NITRATIS, L. *Prep.* 1. (St. B.

Hosp.) Nitrate of silver (crystallised), 12 grs.; liquorice powder, 24 grs.; treacle, q. s. For 12 pills.—*Dose.* 1 pill, twice or thrice a day; in chronic epilepsy and some other spasmodic disorders.

2. (Dr. A. T. Thomson.) Nitrate of silver, 6 grs.; crum of bread, q. s. (say $\frac{1}{2}$ dr.); mix, and divide into 12 pills.—*Dose.* 1, every six hours.

Obs. To prevent the blue or slate coloured tinge of the skin, so often produced by the continued use of the salts of silver, 8 drops of diluted nitric acid in 1 fl. oz. of water should be taken after each pill.

Pills, Norton's Chamomile. *Prep.* From aqueous extract of aloes, 1 dr.; extract of gentian, 3 drs.; mix, and drive off the excess of moisture by the heat of a water bath; then add of essential oil of chamomiles, 20 drops, and divide the mass into 60 pills. To preserve their aromatic properties, they should be kept in a dry glass bottle or a well-covered earthenware pot.—*Dose.* 1, as a dinner pill; or 2, night and morning, as a stomachic tonic. ('Anat. of Quackery.')

Pills of Nux Vomica. *Syn.* PILULÆ NUCIS VOMICÆ, L. *Prep.* 1. Nux vomica and aloes (both in powder), equal parts; syrup, q. s. For 8-gr. pills.—*Dose.* 1 to 3, twice or thrice daily, carefully watching the effects; in nervous derangement, general debility, impotence, paralysis, &c.

2. Alcoholic extract of nux vomica, 1 part; powdered sugar, 2 parts; beaten up with rectified spirit, q. s. For $2\frac{1}{2}$ -gr. pills.—*Dose.* 1 to 2; as the last.

3. (Mondière.) Alcoholic extract, 6 grs.; levigated black oxide of iron, 1 dr.; syrup, q. s. In atonic incontinence of urine, amenorrhœa, &c.

Pills, Odontalgic. *Syn.* PILULÆ ODONTALGICÆ, L. *Prep.* (Ph. Bor.) Powdered opium and extracts of belladonna and henbane, of each, 10 grs.; oil of cloves, 20 drops; powdered pellitory of Spain, $\frac{1}{2}$ dr.; beat them to a mass, and divide it into 1-gr. pills; keep these in a corked phial.

Pills, Opiated Lead. See PILLS OF LEAD.

Pills of Opium. *Syn.* ANODYNE PILLS, NIGHT P., THEBAIC P.; PILULÆ OPII (Ph. U. S.), P. O. or THEBAICÆ (Ph. E.), L. *Prep.* 1. (Ph. E.) Opium and conserve of red roses, of each, 1 part; sulphate of potash, 3 parts; rub them together to a proper mass, and divide into 5-gr. pills.—*Dose.* 1 to 2 pills, as an anodyne or soporific. Each pill contains 1 gr. of opium, or double the quantity in the same pill of the previous edition of the Ph. E.

2. (Ph. U. S.) Powdered opium, 1 dr.; Castile soap, 12 grs.; water, q. s. For 60 pills. As the last.

Pills of Ox-Gall. *Syn.* BILE PILLS; PILULÆ FELLIS BOVINÆ, P. BILIS, L. *Prep.* 1. From inspissated ox-gall formed into pills by the addition of any simple powder; or the harder extract beaten up with a little proof spirit.

Powdered rhubarb is frequently used for the purpose. For 3-gr. pills.—*Dose.* 1 to 6; in constipation, flatulence, &c., arising from a deficiency of bile.

2. (Compound.) From inspissated ox-gall, 1 dr.; powdered rhubarb, $\frac{1}{2}$ dr.; powdered ipecacuanha and capsicum, of each, 15 grs.; oil of caraway, 12 drops. For 48 pills.—*Dose.* 1 to 4; in loss of appetite and dyspepsia, with torpor of the bowels, &c. See CONSTIPATION, GALL, &c.

Pills of Oxide of Gold. *Syn.* PILULÆ AURI OXYDI, L. *Prep.* (Magendie.) Teroxide of gold, 5 grs.; extract of mezereon, 2 drs.; mix, and divide into 60 pills. Each pill contains $\frac{1}{12}$ gr. of teroxide.—*Dose.* 1 to 3; in scrofula, syphilis, malignant fevers, &c.

Pills of Oxide of Mercury. See MERCURIAL PILLS.

Pills of Oxide of Silver. *Syn.* PILULÆ ARGENTI OXYDI, L. *Prep.* From oxide of silver, 6 grs.; powdered rhubarb and extract of gentian, of each, 12 grs. For 1 dozen pills.—*Dose.* 1 pill, twice or thrice daily; in gastralgia, hæmorrhages, nervous affections, &c. Milder than the pills of nitrate of silver.

Pills of Oxide of Zinc. *Syn.* PILULÆ ZINCI OXYDI, L. *Prep.* From oxide of zinc, powdered cascarella, and conserve of hips, equal parts. For 3 $\frac{1}{2}$ -gr. pills. Tonic and antispasmodic.—*Dose.* 1 to 3, thrice daily; in dyspepsia, gastric or spasmodic coughs, epilepsy, chorea, &c.

Pills, Parr's Life. *Prep.* Aloes, 7 lbs.; rhubarb and jalap, of each, 5 lbs.; (all in powder); extract of gentian, 3 $\frac{1}{2}$ lbs.; soft soap, $\frac{1}{2}$ lb.; liquorice powder, treacle, and moist sugar, of each, 4 $\frac{1}{2}$ lbs.; oil of cloves, 10 oz.; oil of caraway, 3 $\frac{1}{2}$ oz.; mix, and beat the whole to a proper mass with syrup bottoms, q. s., and divide it into 33-gr. pills. "There are about 4 dozen in each ls. 1½d. box, weighing (dry) barely 3 grs. each." A good stomachic and aperient pill, but possessing none of the extraordinary virtues ascribed to it by its proprietors. ('Med. Circ,' ii, 146, 167, &c.)

Pills of Paullinia. *Syn.* GUARANA PILLS; PILULÆ GUARANÆ, P. PAULLINIE, L. *Prep.* 1. Paullinia mixed up with syrup of orange peel, and the mass divided into 2 $\frac{1}{2}$ -gr. pills.—*Dose.* 2 to 8.

2. (Dr. Garrelle.) Extract of guarana, 1 dr.; liquorice powder, q. s. For 40 pills.—*Dose.* 3 to 6, daily.

Obs. These pills are highly esteemed on the Continent as a tonic and astringent, in diseases of the bowels and bladder, in chlorosis, debility, &c.

Pectoral Pills. *Syn.* BREATH PILLS; PILULÆ PECTORALES, L. *Prep.* 1. Compound squill pill, 1 dr.; gum benzoin, $\frac{1}{2}$ dr.; powdered ipecacuanha and extract of henbane, of each, 15 grs.; syrup, q. s. For 3-gr. pills.—*Dose.* 2 to 4, three or four times a day; in asthma, chronic bronchial affections, coughs, &c.

2. (Dr. Copland.) Camphor (in powder),

10 grs.; ipecacuanha, 15 grs.; extract of hemlock, 1 dr.—*Dose.* 3 to 6 grs.; in irritating and spasmodic coughs, &c.

3. (Haggart.) Powdered ipecacuanha and squills, of each, $\frac{1}{2}$ dr.; acetate of morphia, 6 grs.; Castile soap, 3 drs.; mix, and divide into 72 pills. A most excellent medicine, at once soothing and expectorant.—*Dose.* 1 to 2, thrice a day, or oftener.

4. (HUMPHRIES' COUGH PILLS.) From powdered ipecacuanha, 15 grs.; compound squill-pill, 1 dr.; compound extract of colocynth, $\frac{1}{2}$ dr. For 3 $\frac{1}{2}$ -gr. pills.—*Dose.* 2 pills, night and morning.

5. (Dr. Latham.) Compound powder of ipecacuanha, 1 dr.; fresh squill and gum ammoniacum, of each, 20 grs.; calomel, 4 grs. For 20 pills. A most valuable pectoral and expectorant.—*Dose.* 1 pill, thrice daily; in bronchitis, coughs, &c., after the more active inflammatory symptoms have subsided.

6. (Napoleon's.) From ipecacuanha, 30 grs.; squills and ammoniacum, of each, 40 grs.; (all in powder;) mucilage, q. s. to mix. For 24 pills. It is said that this was a favourite remedy with the Emperor Napoleon I for difficulty of breathing, bronchitis, and various affections of the organs of respiration.—*Dose.* 2 pills, night and morning.

7. (Dr. Paris.) Powdered squills, $\frac{1}{2}$ dr.; powdered myrrh, 1 $\frac{1}{2}$ dr.; extract of henbane, 40 grs.; water (or simple syrup), q. s. to mix. For 4-gr. pills.—*Dose.* 2 pills, night and morning. As No. 2.

8. (Ph. L. 1746.) Gum ammoniacum, 4 drs.; gum benzoin, 3 drs.; gum myrrh, 2 drs.; saffron, 1 dr.; anisated balsam of sulphur, $\frac{1}{2}$ dr.; syrup of tolu, q. s. to mix.—*Dose.* 5 to 15 grs.

9. (Richter.) Assafœtida and valerian, of each, $\frac{1}{2}$ dr.; castor, 15 grs.; powdered squills and sesquicarbonate of ammonia, of each, 8 grs.; extract of aconite (alcoholic), 3 grs. For 4-gr. pills.—*Dose.* 1 to 3 pills, night and morning; in spasmodic affections of the respiratory organs.

Pills, Perpetual. See EVERLASTING PILLS.

Pills, Peter's. *Prep.* (Cooley.) Aloes, 3 drs.; gamboge, jalap, and scammony, of each, 2 drs.; (all in powder;) calomel, 1 dr.; beaten up with rectified spirit, q. s. A powerful cathartic.—*Dose.* 1 to 3 pills.

Pills of Piperine. *Syn.* PILULÆ PIPERINÆ, L. *Prep.* From piperine, $\frac{1}{2}$ dr.; extract of cinchona, q. s. For 30 pills.—*Dose.* 1 pill, every two hours, during the intermission of an ague; also as an aphrodisiac and a remedy in piles.

Pills of Pitch. *Syn.* PILULÆ PICIS NIGRÆ, L. *Prep.* From black pitch and powdered black pepper, equal parts; beaten together in a warm mortar, and divided into 4-gr. pills.—*Dose.* 2 pills, night and morning; in piles, &c.

Pitschaft's Eecoprotic Pills. *Prep.* From strained aloes and disulphate of quinine, equal

parts; made into 2-gr. pills. A tonic and stomachic aperient.—*Dose.* 2 to 4, at bedtime; in torpor of the large intestines, the dyspepsia of the debilitated, &c.

Plummer's Pills. See PILLS OF CALOMEL (Compound).

Pills, Purgative. *Syn.* PILULÆ PURGANTES, L. *Prep.* 1. (Dr. Robinson.) Aqueous extract of aloes, 1 dr.; powdered scammony, $\frac{1}{2}$ dr.; balsam of Peru, 10 or 12 grs.; oil of caraway, 9 or 10 drops; mix, and divide into 30 pills. A warm, stimulating aperient, highly recommended to excite the peristaltic action of the bowels of the aged, sedentary, and debilitated.—*Dose.* 1 to 4 pills, as required.

2. (Trousseau & Reveil.) Resin of jalap, 1 dr.; scammony, $\frac{1}{2}$ dr.; extract of colocynth, 6 grs.; excipient, as required. For 20 (or, better, 24) pills.—*Dose.* 1, "every two hours, in the morning, fasting, until they operate." For other formulæ see APERIENT and CATHARTIC PILLS and PILLS OF ALOES, JALAP, COLOCYNTH, &c.

Pills of Quinine. See PILLS OF SULPHATE OF QUININE.

Pills, Reece's. See CHIRATTA PILLS.

Pills, Reñal. *Syn.* PILULÆ RENALES, L. *Prep.* 1. Squills, myrrh, and digitalis, of each (in powder), 10 grs.; extract of rhubarb and mercurial pill, of each, 15 grs.; powdered nitre, 20 grs.; oil of juniper, 10 or 12 drops. For 24 pills. Alternative, diuretic, and tonic.—*Dose.* 3 to 6, thrice a day. Hunter's Renal Purifying Pills are similar, but omitting the mercurial pill. De Roos' Renal Pills contain a preparation of copaiba.

Pills, Rheumatism. *Syn.* PILULÆ ANTIRHEUMATICÆ, L. *Prep.* 1. Gum guaiacum, 1 dr.; nitrate of potassa, $1\frac{1}{2}$ dr.; (both in powder;) soft soap (Ph. L.), $\frac{1}{2}$ dr.; oil of cajuput, 16 drops. For 4 dozen pills.—*Dose.* 2 to 6, night and morning; in chronic rheumatism, and rheumatic gout. Their action is accelerated by the copious use of lemon juice during the day.

2. (Beasley.) Extract of artichoke, $\frac{1}{2}$ dr.; powdered sarsaparilla, 20 grs.; oil of sassafras, 1 drop. For 12 pills.—*Dose.* 1 pill, thrice daily.

Pills of Rhubarb. *Syn.* PILULÆ RHEI (Ph. E.), L. *Prep.* 1. (Ph. E.) Powdered rhubarb, 9 parts; acetate of potassa, 1 part; conserve of red roses, 5 parts; mix, and divide into 5-gr. pills. A stomachic and gentle aperient, particularly useful in atonic dyspepsia.—*Dose.* 2 to 4 pills.

2. (Ph. U. S.) Powdered rhubarb, 6 drs.; Castile soap, 2 drs.; beaten up with water, q. s., and divide into 120 pills. As the last.

Pills of Rhubarb (Compound). *Syn.* AROMATIC PILLS, BALSAMIC LAXATIVE P., EDINBURGH P., STOMACHIC P.; PILULÆ RHEI COMPOSITÆ (B. P., Ph. L.), PILULÆ R. COMPOSITÆ (Ph. E. & D.), P. STOMACHICÆ, P. AROMATICÆ, L. *Prep.* 1. (Ph. L.) Powdered rhubarb, 4

drs.; powdered Socotrine aloes, 3 drs.; powdered myrrh, 2 drs.; soft soap, (Ph. L.), $\frac{1}{2}$ dr.; oil of caraway, 15 drops; treacle, q. s. to form a mass.

2. (Ph. L. 1836.) Powdered rhubarb, 1 oz.; aloes, 6 drs.; myrrh, 4 drs.; Castile soap, 1 dr.; oil of caraway, $\frac{1}{2}$ fl. dr.; syrup, q. s.

3. (Ph. E.) Powdered rhubarb, 12 parts; aloes, 9 parts; myrrh and Castile soap, of each, 6 parts; conserve of red roses, 5 parts; oil of peppermint, 1 part; mix, and divide into 5-gr. pills. The oil of peppermint may be omitted, when so preferred.

4. (Ph. D.) Rhubarb, $1\frac{1}{2}$ oz.; hepatic aloes, 9 drs.; myrrh and Castile soap, of each, in fine powder, 6 drs.; oil of peppermint, 1 fl. dr.; treacle, 2 oz.; mix, and beat the whole to a uniform mass.

5. (Ph. U. S. & Ph. E. 1817.) Rhubarb, 8 drs.; aloes, 6 drs.; myrrh, 4 drs.; oil of peppermint, $\frac{1}{2}$ fl. dr.; syrup of orange peel, q. s.; mix, and divide into 240 pills.

6. (B. P.) Rhubarb, in fine powder, 3 oz.; Socotrine aloes, in fine powder (some physicians prefer the aqueous extract.—*Squire*), $2\frac{1}{2}$ oz.; myrrh, in fine powder, $1\frac{1}{2}$ oz.; hard soap, $1\frac{1}{2}$ oz.; English oil of peppermint, $1\frac{1}{2}$ dr.; treacle, by weight, 4 oz.; reduce the soap to fine powder and triturate it with the rhubarb, aloes, and myrrh; add the treacle and oil, and beat into a mass.—*Dose.* 5 to 10 grs.

Obs. The above are tonic, stomachic, and gently laxative; extremely useful for obviating costiveness and giving tone to the stomach and bowels.—*Dose.* 6 or 8 to 20 grs. The London pill is not only the most agreeable, but it keeps the best.

Pills of Rhubarb and Caraway. See KITCHENER'S PILLS.

Pills of Rhubarb and Chamomile. *Syn.* SPEEDIMAN'S PILLS; PILULÆ RHEI ET ANTHEMIDIS, L. *Prep.* From aloes, myrrh, rhubarb (each in powder), and extract of chamomile, of each, 1 dr.; essential oil of chamomile, 10 or 12 drops. For 4-gr. pills. An excellent tonic and stomachic aperient, particularly useful in the dyspepsia and loss of appetite of hard drinkers.—*Dose.* 1 to 3 pills, either before dinner or at bedtime.

Pills of Rhubarb and Copai'ba. *Syn.* PILULÆ RHEI ET COPAIBE, P. R. BALSAMICÆ, L. *Prep.* (Swediaur.) Powdered rhubarb and gum, equal parts; balsam of copaiba, q. s.

Pills of Rhubarb and Ginger. *Syn.* STOMACH PILLS; PILULÆ RHEI ET ZINGIBERIS, L. *Prep.* From powdered rhubarb, 1 dr.; powdered ginger, $\frac{1}{2}$ dr. Castile soap, 20 grs.; tincture or essence of ginger, q. s. to form a mass. For 30 pills.—*Dose.* 1 to 6.

Pills of Rhubarb and Ipecacuanha. *Syn.* PILULÆ RHEI ET IPECACUANHÆ, L. *Prep.* From rhubarb, $\frac{1}{2}$ dr.; ipecacuanha, 15 grs.; opium, 5 grs.; (each in powder) oil of cinnamon, 6 drops; syrup, q. s. For 18 pills.—*Dose.* In loss of appetite and spasmodic dyspepsia, 1 to 3 pills, twice a day; in dysentery,

diarrhoea, &c., to relieve tormina and tenesmus, 1 every two hours.

Pills of Rhubarb and Iron. *Syn.* PILULÆ RHEI ET FERRI (Ph. E.), *L. Prep.* (Ph. E.) Dried sulphate of iron, 4 parts; extract of rhubarb, 10 parts; conserve of red roses, 5 parts; beat them to a proper mass, and divide this into 5-gr. pills.—*Dose.* 2 to 4 pills; in the atonic dyspepsia of debilitated subjects, in chlorosis, &c.

Pills of Rhubarb and Ox-gall. *Syn.* PILULÆ RHEI ET FELLIS BOVINI, *L. Prep.* From powdered rhubarb, gum ammoniacum, and inspissated ox-gall, equal parts; beaten up with a little tincture of ginger or proof spirit, and the mass divided into 2½-gr. pills. In dyspepsia and constipation dependent on a torpid action of the liver.—*Dose.* 2 to 6 pills.

Pills of Rhubarb and Soda. *Syn.* PILULÆ RHEI ET SODÆ, P. R. COMP. CUM SODÆ, *L. Prep.* (Guy's Hosp.) Dried carbonate of soda, powdered rhubarb, and extract of gentian, equal parts. For 4½-gr. pills.—*Dose.* 2 to 4 pills; in acidity, heartburn, diarrhoea, loss of appetite, &c.

Pills, Richter's. See PECTORAL PILLS.

Pills, Dr. Robinson's. See PURGATIVE PILLS.

Pills, Rudius's. *Syn.* RUDIUS'S EXTRACT; PILULÆ RUDII, EXTRACTUM RUDII, *L. Prep.* 1. Colocynth pulp, 6 drs.; agaric, black hellebore, and turpethum root, of each, 4 drs.; cinnamon, mace, and cloves, of each, 40 grs.; rectified spirit, ½ pint; digest for 4 days, express the tincture, and evaporate it to a proper consistence for making pills. Formerly esteemed one of the most safe and certain cathartics in troublesome constipation.—*Dose.* 5 to 20 grs.

2. (Ph. A. 1783.) Black hellebore and colocynth, of each, 2 oz.; water, 4 pints (o. w. m.); boil to a quart, strain, evaporate to the consistence of honey, and add, of aloes, 2 oz.; scammony (powdered), 1 oz.; next remove the vessel from the fire, and further add of sulphate of potassa, 2 drs.; oil of cloves, 1 dr.; and form the whole into a pill-mass. Resembles the last (nearly).

Pills, Rufus's. See PILLS OF ALOES WITH MYRRH.

Pills of Saffron. *Syn.* PILULÆ CROCI, *L. Prep.* From hay saffron, 1 dr.; myrrh, ½ dr.; oil of cajeput, 6 drops; syrup of saffron, q. s. For 36 pills.—*Dose.* 1 to 3 or 4, occasionally; as a stimulant in low spirits, hypochondriasis, &c.

2. (Phœbus.) Saffron, myrrh, and sulphur, equal parts; inspissated bile, q. s. For 2-gr. pills.—*Dose.* 2 to 12 daily; as an emmenagogue.

Pills of Sagapenum (Compound). *Syn.* PILULÆ SAGAPENI COMPOSITÆ, *L. Prep.* (Ph. L. 1836.) Sagapenum, 1 oz.; aloes, ½ dr.; syrup of ginger, q. s.—*Dose.* 5 to 20 grs.; as a stimulant antispasmodic laxative, in dyspepsia with flatulence, flatulent colic, &c.

Pills of Salicin. *Syn.* PILULÆ SALICINÆ, *L. Prep.* From salicin, ½ dr.; powdered rhubarb, 20 grs.; extract of gentian, q. s. to mix. For 4-gr. pills.—*Dose.* 2 to 4, every three hours, during the apyrexia of intermittents.

Pills of Scammony (Compound). *Syn.* PILULÆ SCAMMONII COMPOSITÆ, *L. Prep.* (St. B. Hosp.) Scammony, 24 grs.; ginger, 20 grs.; aloes and gamboge, of each, 12 grs.; treacle, q. s.; mix, and divide into 12 pills. A powerful cathartic and vermifuge.—*Dose.* 1 to 3 pills.

Scott's Pills. *Prep.* From aloes, 9 lbs.; jalap, 3 lbs.; gamboge and ginger, of each, ½ lb.; beaten with treacle, q. s. See ANDERSON'S SCOT'S PILLS.

Dr. Scott's Bilious and Liver Pills. *Prep.* (Cooley.) Compound extract of colocynth (Ph. L. 1836), 8 oz.; powdered rhubarb, 4 oz.; powdered myrrh, 2 oz.; soft soap, ½ oz.; oil of caraway, 2½ drs.; strong syrup of saffron, q. s. to form a pill-mass. "There are twenty-five 3½-gr. pills in each ls. 1½d. box." "It has been stated that these pills contain a minute portion of antimony." ('Anat. of Quackery.')

Sedative Pills. *Syn.* PILULÆ SEDATIVÆ, *L. Prep.* 1. Hydrochlorate of morphia, 6 grs.; powdered sumbul, 20 grs.; alcoholic extract of Indian hemp, ½ dr. For 2-gr. pills.—*Dose.* 1 to 3, twice or thrice daily; in excessive nervous irritability, painful menstruation, &c.

2. (U. C. Hosp.) Camphor, 1 dr.; reduce it to powder by means of rectified spirit, 3 or 4 drops; add of extract of henbane, 20 grs., and divide the mass into 20 pills. To allay pain and excitement, &c.—*Dose.* 1 to 2 pills.

3. To either of the above, add of powdered rhubarb and extract of gentian, of each, 20 grs., and divide the mass into 4-gr. pills.—*Dose.* 1 to 4 pills; when, besides the other symptoms, the stomach and bowels are disordered.

Sedillot's Febrifuge Pills. *Prep.* From powdered opium, 3 grs.; sulphate of quinine, 12 grs.; confection of opium, 10 grs., or q. s. For 12 pills.—*Dose.* 1 to 2, every second hour, during the intermission of an ague.

Pills of Sen'na. *Syn.* PILULÆ SENNÆ, P. S. COMPOSITÆ, *L. Prep.* 1. Powdered senna, 1 dr.; extract of rhubarb, ½ dr.; powdered capsicum, 4 grs.; oil of juniper, 6 or 8 drops. For 3-gr. pills. An aperient well suited for females.—*Dose.* 5 to 8 pills.

2. (Hufeland.) Powdered senna, 1 dr.; extract of dandelion, q. s. to mix. For 30 pills. As the last.

Smith's Pills. *Prep.* From powdered aloes, 4 drs.; jalap, 2 drs.; ginger and soft soap, of each, 1 dr.; oil of juniper, ½ dr.; emetic tartar, 6 grs. For 120 pills. Laxative and diuretic.—*Dose.* 1 to 4, at bedtime, or early in the morning.

Dr. Hugh Smith's Pills. See STOMACH PILLS.

Pills of Soap. *Syn.* PILULÆ SAPONIS, P. CUM SAPONE, L. *Prep.* (P. Cod.) White Castile soap, 32 parts; powdered marsh-mallow root, 4 parts; powdered nitrate of potassa, 1 part; beat them to a mass, and divide this into 4-gr. pills. In habitual costiveness, calculary affections, &c.—*Dose.* 1 to 6 pills, twice or thrice a day.

Pills of Soap (Compound). *Syn.* PILLS OF SOAP AND OPIUM, LAUDANUM PILLS; PILULA SAPONIS COMPOSITA (B. P., Ph. L.), PILULÆ SAPONIS CUM OPIO, L. *Prep.* 1. (Ph. L.) Opium and liquorice, of each (in powder), 2 drs.; soft soap (Ph. L.), 6 drs.; beat them to a uniform mass.

2. (Ph. D. & Ph. U. S.) Opium (in fine powder), $\frac{1}{2}$ oz.; Castile soap, 2 oz.; distilled water, $\frac{1}{2}$ fl. dr., or q. s.; reduce the soap to powder, mix it with the other ingredients, and beat the whole together, as before. See PILLS OF OPIUM.

Obs. The above pills contain 1-5th part of their weight in dry opium. The dose is 3 to 10 grs., in the usual cases in which the administration of opium is indicated. Mr. Skey, the eminent surgeon of St. Bartholomew's Hospital, has shown the great value of this pill in promoting the healing of obstinate ulcers, more especially those of the legs.

Pills of Soda. *Syn.* PILULÆ SODÆ CARBONATIS, L. *Prep.* (Ph. E. 1817.) Exsiccated carbonate of soda, 4 parts; Castile soap, 3 parts; syrup, q. s. to form a mass. Antacid and slightly laxative.—*Dose.* 10 to 20 grs. This pill was a great favourite of the once celebrated Dr. Beddoes.

Speediman's Pills. *Prep.* (Cooley.) Aloes, 3 drs.; rhubarb, myrrh, (all in powder), and extract of chamomile, of each, 1 dr.; oil of chamomile, 20 drops. For 4-gr. pills. An excellent aperient, tonic, and stomachic.—*Dose.* 2 to 4 pills, as a purgative; 1, as a stomachic or dinner pill.

Splenetic Pills. *Syn.* PILULÆ ANTISPLETICÆ, L. *Prep.* (Saunders.) Strained aloes and gum ammoniacum, of each, 3 drs.; myrrh and bryony, of each, $\frac{1}{2}$ dr. For 4-gr. pills.—*Dose.* 3 to 5. "Extolled in amenorrhœa and hypochondriasis." (Dr. R. E. Griffith.)

Pills of Squill (Compound). *Syn.* COUGH PILLS, PILLS OF SQUILLS AND GINGER; PILULA SCILLÆ COMPOSITA (B. P., Ph. L.), PILULÆ SCILLÆ COMPOSITÆ (Ph. D.), P. SCILLÆ (Ph. E.), L. *Prep.* 1. (Ph. L.) Freshly powdered squills, 1 dr.; powdered ginger and powdered ammoniacum, of each, 2 drs.; mix, add, of soft soap (Ph. L.), 3 drs.; treacle, 1 dr.; and beat the whole together, so that a mass may be formed.

2. (Ph. E.) Squills, 5 parts; ammoniacum, ginger, (all in fine powder), and Spanish soap, of each, 4 parts; conserve of red roses, 2 parts; mix, as before, and divide the mass into 5-gr. pills.

3. (Ph. D.) Squills (in fine powder), $2\frac{1}{2}$ drs.;

ammoniacum, ginger, and Castile soap, of each (in fine powder), 2 drs.; treacle, $\frac{1}{2}$ oz.

4. (B. P.) Squill (in fine powder), $1\frac{1}{2}$; ginger (in fine powder), 1; ammoniacum (in powder), 1; hard soap (in powder), 1; treacle (by weight), 2, or a sufficiency; mix the powders, add the treacle, and beat into a mass.—*Dose.* 5 to 10 grains.

Obs. Compound squill pill is a most useful expectorant, in chronic coughs, asthmas, bronchial affections, difficulty of breathing, &c.; and, combined with calomel and foxglove, and, occasionally, with croton oil, as a diuretic, &c., in dropsies. Unfortunately, however, it soon spoils; and, therefore, to be effective as a remedy, it must be recently prepared. As an expectorant, it should not be administered until the inflammatory symptoms have been subdued by purgatives or bleeding. A little powdered opium, or extract of henbane, is occasionally added, to allay irritation.—*Dose.* 5 to 20 grs., twice or thrice a day, accompanied by an occasional aperient.

Stahl's Pills. See APERIENT PILLS.

Starkey's Pills. *Prep.* (Original formula.) Extract of opium, 4 oz.; mineral benzoar and nutmeg, of each, 2 oz.; saffron and Virginian snake-root, of each, 1 oz.; Starkey's soap, $\frac{1}{2}$ lb.; oil of sassafras, $\frac{1}{2}$ oz.; tincture of antimony (Old Ph.), 2 fl. oz. Anodyne, diaphoretic, &c.—*Dose.* 3 to 10 grs. The formula already given under MATTHEW'S PILLS is erroneously assigned to this pill by some writers.

Mrs. Stephen's Pills. This once celebrated remedy for stone was prepared from the calcined shells of eggs and snails, made into 3-gr. pills with soft soap. Its active ingredients were, consequently, lime and potash.

Stimulant Pills. *Syn.* PILULÆ STIMULANTES, L. *Prep.* 1. Capsicum, $\frac{1}{2}$ dr.; nitrate of silver, 2 grs.; conserve of hips, q. s. For 12 pills.—*Dose.* 2 to 4, washed down with a spoonful of warm spirit-and-water, and repeated hourly, until reaction ensues; in cholera, &c.

2. (A. T. Thomson.) Strychnine, 1 gr.; acetic acid, 1 drop; crum of bread, 20 grs.; mix very carefully, and divide the mass into 10 pills.—*Dose.* 1, every six hours; in paralysis arising from lead.

Stoerck's Pills. *Syn.* PILULÆ CONII, P. CIOUÆ, L. *Prep.* From extract of hemlock, 1 dr.; powdered hemlock, q. s. to make a mass. For 2-gr. pills.—*Dose.* 1 to 4, twice a day; in various glandular and visceral enlargements, pulmonary affections, cancer, scrofula, neuralgia, &c.

Stomach Pills. *Syn.* PILULÆ STOMACHICÆ, L. *Prep.* 1. Ipecacuanha, 10 grs.; sumbul and extract of rhubarb, of each, 30 grs.; powdered quassia, 20 grs.; oil of sassafras, 6 drops; beaten up with essence of ginger (strongest), q. s. For 3-gr. pills.—*Dose.* 1 to 3, thrice daily; in loss of appetite, flatulence, dyspepsia, &c.

2. (Dr. Hugh Smith's.) From aloes, rhubarb, ginger, (all powdered,) and sagapenum

of each, 1 dr.; oils of peppermint and cloves, of each, 10 drops; balsam of Peru, q. s. to mix. For 5-gr. pills.—*Dose*. 2 or 3 nightly; or 1 to 2, before dinner. For other formulae, see DINNER, APPEIANT, COMPOUND RHUBARB, ALOES AND MASTIC PILLS, &c.

Pills of Sto'rax (Compound). *Syn.* STORAX PILLS; PILULA STYRACIS COMPOSITA (Ph. L.), PILULÆ STYRACIS (Ph. E.), L. *Prep.* 1. (Ph. L.) Prepared storax, 6 drs.; saffron and powdered opium, of each, 2 drs.; beat them together to a uniform mass. Contains 1-5th of its weight of opium.

2. (Ph. E.) Opium and saffron, of each, 1 part; extract of styraç, 2 parts; beat them to a uniform mass, and divide this into 4-gr. pills. Contains 1-4th part of opium.

Obs. The storax is here chiefly employed to disguise the odour and taste of opium. The name of the preparation has been chosen so that the word 'opium' may not appear in the prescription, a point highly necessary with certain patients.—*Dose*. 3 to 10 grs.; as compound soap pill, and as an anodyne and expectorant in chronic coughs, &c.

Pills of Stramonium. *Syn.* PILULÆ STRAMONII, L. *Prep.* 1. Stramonium seeds (in powder), 12 grs. (or leaves, 25 grs.); powdered camphor and extract of seneka root, of each, 1 dr.; powdered savine, 1½ dr.; oil of cajeput, 15 drops. For 2½-gr. pills.—*Dose*. 2 to 4, thrice daily; in rheumatism, &c.

2. (Sir H. Hallford.) Extract of stramonium and liquorice powder, of each, 1 dr.; powdered Castile soap, 2 drs.; mucilage, q. s. to mix. For 60 pills.—*Dose*. 1, night and morning; in asthma, &c.

Pills of Strychnine. *Syn.* PILULÆ STRYCHNINÆ, L. *Prep.* (Magedieu.) Strychnine, 2 grs.; conserve of hips, 36 grs.; (liquorice powder, q. s.); mix very carefully, divide the mass into 24 pills, and silver them.—*Dose*. 1 pill, night and morning; in amaurosis, impotence, paralysis, &c.

Pills of Sulphate of Iron. *Syn.* PILULÆ FERRI SULPHATIS (Ph. E.), L. *Prep.* 1. (Ph. E.) Dried sulphate of iron and conserve of red roses, of each 2 parts; extract of dandelion, 5 parts. For 5-gr. pills. A useful chalybeate tonic.—*Dose*. 1 to 2, twice or thrice daily; in dyspepsia, chlorosis, amenorrhœa, &c.

2. (Ph. E. 1817.) Sulphate of iron (dried), 1 oz.; extract of chamomile, 1½ oz.; oil of peppermint, 1 dr.; syrup, q. s. As the last.

3. (Ph. U. S.) As No. 1, but substituting extract of gentian for extract of dandelion. For other formulae, see HOOPEE'S PILLS, &c.

Pills of Sulphate of Quinine. *Syn.* PILULÆ QUININÆ SULPHATIS, P. Q. DISULPHATIS, L. *Prep.* 1. Sulphate of quinine, 20 grs.; extract of gentian, 40 grs. For 20 pills.

2. (Ph. U. S.) Sulphate of quinine, 2 drs.; powdered gum, ½ dr.; strained honey, q. s. For 120 pills. Each pill contains 1 gr. of the sulphate or disulphate of quinine.—*Dose*. 1 or 2,

twice a day, as a tonic and stomachic; 6 to 12, every two or three hours, during the remissions of agues.

Obs. Various additions are often made to the above formulae, according to the indications, by which numerous other useful pills are produced. Thus, potassio-tartrate of antimony is frequently added in obstinate intermittents; iodide of potassium, in scrofulous affections; foxglove, in the hectic fever of phthisis; bitter tonics and aromatics, in dyspepsia, flatulence, &c.; carbonate of soda or magnesia, in acidity and heartburn; calomel, mercurial pill, in bilious affections; rhubarb and aloes, in bowelly affections; sulphate of iron and other chalybeates, in debility, amenorrhœa, and chlorosis; calomel, as an alterative; &c., &c.

Pills of Sulphate of Zinc. *Syn.* PILULÆ ZINCI SULPHATIS, P. Z. S. COMPOSITÆ, L. *Prep.* 1. Sulphate of zinc, 12 grs.; extract of gentian, ½ dr.; liquorice powder, q. s. For 20 pills. In dyspepsia, epilepsy, and various convulsive diseases.

2. (Dr. Paris.) Sulphate of zinc, 10 grs.; powdered myrrh, 1½ dr.; conserve of roses, q. s. For 30 pills.—*Dose*. 1 to 2, twice or thrice daily; in whooping-cough, &c.

Pills, Syphilis. *Syn.* PILULÆ ANTISYPHILITICÆ, L. See the various pills of mercury, gold, &c. The pills of corrosive sublimate commonly pass under this name.

Pills, Tangore. See ARSENICAL PILLS.

Pills of Tannic Acid. *Syn.* PILULÆ TANNINI, P. ACIDI TANNICI, L. *Prep.* From tannic acid or tannin and powdered sugar, of each, ½ dr.; conserve of roses, q. s. For 24 pills.—*Dose*. 1 or 2 pills, thrice daily, in diarrhœa; or 2, every three hours, in internal hæmorrhages, spitting of blood, &c.

Pills of Tar. *Syn.* PILULÆ PICIS LIQUIDÆ, L. *Prep.* From tar, 1 dr.; powdered gentian, ½ dr., or q. s. For 24 pills. Stimulant, diuretic, and sudorific.—*Dose*. 1 to 4, thrice a day; in dropsies, worms, ichthyosis, and several other skin diseases, &c.

Pills of Taraxacum. *Syn.* PILULÆ TARAXACI, L. *Prep.* 1. Extract of dandelion, 1 dr.; powdered rhubarb, q. s.; divide into 3½-gr. pills. In dyspepsia, &c., complicated with congestion of the liver.

2. (St. Marie.) Extract of dandelion and Castile soap, equal parts; liquid acetate of potassa, q. s. to mix. For 4-gr. pills. As a diuretic in dropsy.

3. Extract of dandelion, 1 dr.; mercurial pill, 20 grs.; powdered digitalis, 15 grs.; liquorice powder, q. s. For 24 pills.—*Dose*. 1, afterwards increased to 2 or 3; in dropsy connected with liver disease.

Pills, Thomson's Stomach and Liver. *Prep.* From extract of dandelion, 1 dr.; scammony and rhubarb, of each, 15 grs. For 14 pills.—*Dose*. 2 pills, night and morning; in hysteria, hypochondriasis, and chronic inflammation of the liver or kidneys.

Pills, Tonic. *Syn.* PILULE TONICÆ, L. *Prep.* 1. Sulphate of iron, ginger, and myrrh, (all in powder), equal parts; conserve of roses, q. s.; mix, and divide into 4-gr. pills.—*Dose.* 1, twice a day; in debility, chlorosis, &c.

2. Powdered myrrh and sulphate of iron, of each, 1 dr.; disulphate of quinine, $\frac{1}{2}$ dr.; powdered capsicum, 15 grs.; conserve of roses, q. s. to mix. For 60 pills.—*Dose.* 1 or 2, twice or thrice a day; in debility, dyspepsia, ague, &c.

3. (Dr. Collier.) Tartrate of iron and extract of gentian, of each, 1 dr.; oil of cinnamon, 2 drops. For 30 pills.—*Dose.* 3 to 6, three or four times a day. A good stomachic tonic.

4. (Dr. Collier.) Oxide of zinc, $\frac{1}{2}$ dr. (or sulphate of zinc, 20 grs.); myrrh, 2 drs.; camphor, 20 grs.; confection of hips, to mix. For 40 pills.—*Dose.* 1 or two pills, three times a day; in epilepsy, chorea, and other nervous disorders, debility, &c.

5. (Dr. A. T. Thomson.) Rhubarb and ginger, of each, $\frac{1}{2}$ dr.; extract of chamomile, 1 dr.; divide into 30 pills.—*Dose.* 2 or 3, twice a day; in dyspepsia and chlorosis.

6. (Dr. A. T. Thomson.) Sesquioxide of iron and extract of hemlock, of each, 1 dr.; mix, and divide into 20 pills.—*Dose.* 1 or 2, twice a day; in fluor albus, scrofula, &c. Several other formulæ for tonic pills will be found under the names of the leading ingredients, &c. (See above.)

Pills of Vale'rian (Compound). *Syn.* PILULE VALERIANÆ COMPOSITE, L. *Prep.* (Dupuytren.) Powdered valerian, $\frac{1}{2}$ dr.; castor and white oxide of zinc, of each, 20 grs.; syrup, q. s. to mix. For 18 pills.—*Dose.* 2 or 3, thrice daily; in hysteria, hypochondriasis, chlorosis, hemicrania, &c.

Pills of Vale'rianate of Zinc. *Syn.* PILULE VALERIANAS, L. *Prep.* From valerianate of zinc and powdered gum, of each, 15 grs.; conserve of hips, q. s. to form a mass. For 18 pills. *Dose.* 1 pill, twice daily; in nervous headache, neuralgia, hysteria, &c.

Pills, Vallet's. See PILLS OF CARBONATE OF IRON.

Pills, Vance's. See APERIENT PILLS.

Pills of Veratrine. *Syn.* PILULE VERATRINÆ, L. *Prep.* 1. (Magendie.) Veratrine, $\frac{1}{2}$ gr.; powdered gum arabic and syrup of gum, of each, q. s. to form 6 pills. (See below.)

2. (Turnbull.) Veratrine, 1 gr.; extract of henbane and liquorice powder, of each, 12 grs.; mix, and divide into 12 pills.—*Dose.* 1 pill, every 3 hours; in dropsy, epilepsy, hysteria, paralysis, nervous palpitations, &c. This should be prepared and used with great caution.

Pills, Ward's Red. *Syn.* WARD'S ANTIMONIAL PILLS. *Prep.* From glass of antimony (finely levigated), 4 oz.; dragon's blood, 1 oz.; mountain wine, q. s. to form a mass. For 1½-gr. pills. Emetic. "They are recommended in

obstinate rheumatic affections, in foulness of the stomach and bowels, &c. Their action is often of a very unpleasant character." ('Anat. of Quackery.')

Pills, Lady Webster's. See DINNER PILLS.

Pills, Whitehead's Essence of Mustard. Balsam of tolu, with resin. (Dr. Paris.)

Pills, Whytt's. *Prep.* (Radius.) Aloes, chloride of iron, and extract of horehound, of each $\frac{1}{2}$ dr.; assafoetida, 1½ dr. For 2-gr. pills.—*Dose.* 2 to 5, thrice daily; in leucorrhœa, chlorosis, hysteria, &c., with constipation.

Pills, Worm. *Syn.* PILULE ANTHELMINTICÆ, P. VERMIFUGÆ, L. *Prep.* 1. Calomel, 1 oz.; sugar, 1½ oz.; mucilage, q. s.; mix, and divide into 240 pills.—*Dose.* 1 to 2, overnight, followed by a strong dose of castor oil early the next morning.

2. Gamboge, 6 grs.; calomel, 5 grs.; mucilage, q. s.; divide into 3 pills. For a morning's dose, fasting.

3. Extract of wormwood, calomel, and powdered scammony, equal parts. For 4-gr. pills.—*Dose.* 2 to 1, as the last. For ascariæ, and other small worms.

4. (Bresmer.) Powdered aloes and tansy seed, of each, $\frac{1}{2}$ dr.; oil of rue, 9 or 10 drops. For 12 pills.—*Dose.* 3 to 6, in the morning, fasting, and repeated in two or three hours.

5. (Phœbus.) Iron filings, $\frac{1}{2}$ dr.; assafoetida, 1½ dr.; essential oil of tansy, 10 or 12 drops; extract of wormwood, q. s.; mix, and divide into 80 pills. *Dose.* 6 pills, thrice daily.

6. (Peschier.) Ethereal extract of male fern, 30 drops; extract of dandelion, 1 dr.; powdered rhizomes of male fern, q. s. to mix. For 30 pills. In tape-worm.—*Dose.* 6 to 15, at bedtime; the dose being repeated in the morning, and then followed in an hour by a strong dose of castor oil.

Pills, Wordsell's (Kaye's). *Prep.* (Cooley.) Powdered aloes, gamboge, and ginger, equal parts; together with a very small quantity of diaphoretic antimony, beaten into a mass with either syrup or treacle, and divided into 2½-gr. pills. "There are about 4½ dozen pills in each 1s. 1½d. box." "The dose, as given in the directions, is from 2 to 8 pills (or even 10 to 12) daily." ('Anat. of Quackery.')

They frequently operate with great violence. **Pills, Wyndham's (Lee's).** *Prep.* (Cooley.) Aloes and gamboge, of each (in powder), 3 oz.; Castile soap and extract of cow-parsnip, of each, 1 oz.; nitre, $\frac{1}{2}$ oz. For 5-gr. pills. A powerful drastic cathartic.—*Dose.* 1 to 3 pills.

Pills of Zinc. See PILLS OF OXIDE, SULPHATE, and VALERIANATE OF ZINC, &c.

PIMARIC ACID. A resin acid first obtained by Laurent from the turpentine of *Pinus maritima* (Bordeaux turpentine), by the action of hot alcohol.

PIMENTO. *Syn.* ALLSPICE, CLOVE PEPPER, JAMAICA P., PIMENTO BERBICE, PIMENTA (B.P., Ph. L. E. & D.), PEPPER CARIBBEANUM, P. JAMAICENSE, P. ODORATUM, PIMENTÆ

BACCE, L. "The dried unripe berries of the allspice tree, *Eugenia pimenta*, from the West Indies"—B. P. "The immature fruit of *Eugenia pimenta* (*Myrtus pimenta*, Linn.)"—Ph. L. It possesses a mixed odour of cinnamon, cloves, and nutmegs, which, with its other properties, it for the most yields to alcohol, ether, and water. It is a stimulant and tonic, and is much esteemed as an adjuvant in medicines prescribed in dyspepsia, flatulence, gout, hysteria, &c.; and also to cover the taste of disagreeable medicines.—*Dose*. 5 to 30 grs., bruised or in powder. See **ESSENCE**, **OILS** (Volatile), **SPIRITS**, and **WATERS**.

PIMPLES. See **ERUPTIONS** (Papular).

PINCHBECK. A gold-like alloy of copper and zinc. See **DUTCH GOLD**.

PINE APPLE. *Syn.* **ANANAS**. The fruit of *Ananassa sativa*, a plant of the natural order *Bromeliaceae*. It is astringent, esculent, and possesses a rich flavour and odour. In Europe it is chiefly used as a delicacy for the table; but in tropical climates it is said to be valuable in renal diseases. See **ESSENCE**, &c.

PINEY TALLOW. *Syn.* **PINEY RESIN**, P. **DAMMAR**. An oleo-resinous substance obtained from the fruit of *Vateria indica*, a tree common in Malabar, by boiling it with water. It is intermediate between fat and wax, makes good soap and excellent candles. It melts at 98° Fahr. Sp. gr. .9250 to .9265.

PINIC ACID. The portion of common resin or colophony which is soluble in cold alcohol of sp. gr. .833.

PINK. A well-known shade of light red. The name is also applied to several pigments, consisting of whitening stained with liquid dyes. See **RED** and **YELLOW PIGMENTS**, &c.

PINK DYE. *Prep.* From washed safflower, 2 oz.; salt of tartar, $\frac{1}{2}$ oz.; cold water, 1 quart; digest for 3 hours, express the liquor, and strain it. *Used* as a cosmetic, and to dye silk stockings, &c., of a rose colour. The colour is brought out by afterwards applying to, or passing the articles through, water soured with lemon juice. See **SAUCERS** (Pink).

PIPERINE. $C_{17}H_{19}NO_3$. *Syn.* **PIPERINA**, **PIPERINUM**, L. *Prep.* (P. Cod.) Alcoholic extract of black pepper is treated with a weak solution of caustic potassa (1 to 100), and the residuum, after being washed with cold water, is dissolved in alcohol; the solution is next agitated with a little animal charcoal, and the filtrate is allowed to evaporate spontaneously; the product may be purified by the re-solution in alcohol, and re-crystallisation.

Prop., &c. Colourless, or only slightly yellow; tasteless; inodorous; fusible; and crystallisable; insoluble in water; freely soluble in strong spirit, and in the acids; very feebly basic; (a few definite compounds have, however, been obtained with difficulty;) reddened by oil of vitriol. It has been much employed in Italy and on the Continent as a febrifuge.—*Dose*. 2 to 10 grs., frequently repeated, during the pyrexia of intermittents.

Obs. An assay for its piperine is the only certain method of testing the quality of either black or white pepper. For this purpose a weighted quantity of the sample is reduced to powder, and is exhausted with alcohol of the sp. gr. .833; the mixed tinctures are then evaporated to an extract, which is treated as above. See **PEPPER**.

PIPES. (In confectionery.) These are formed from any of the common lozenge-masses, by rolling them into cylinders of about the thickness of a goose-quill. They are frequently medicated.

PISTACHIO NUTS. *Syn.* **PISTACIA NUTS**; **NUCES PISTACIE**, L. The kernels of the fruit of *Pistacia vera* (Linn.), one of the turpentine trees. They closely resemble almonds, but are sweeter, and form a green emulsion with water. *Used* in confectionery and perfumery, and also as a dessert fruit.

PITCH. *Syn.* **BLACK PITCH**, **BOILED P.**, **STONE P.**, **WOOD P.**; **PIX** (Ph. L.), **PIX NIGRA**, L. "A dry bitumen prepared from liquid pitch." (Ph. L.) The residuum from boiling tar in an open iron pot, or in a still, until the volatile and liquid portion is driven off. The volatile products principally consist of crude pyroligneous acid and oil of tar. Pitch is chiefly employed in ship-building. As a medicine, it is stimulant and tonic, and has been used internally in some skin diseases, and in piles. An ointment made of it is also extensively used in cutaneous affections of the scalp.—*Dose*. 10 grs. to $\frac{1}{2}$ dr.

Burgundy Pitch. *Syn.* **WHITE PITCH**, **BURGUNDY PINE RESIN**; **PIX BURGUNDICA**, (B.P., Ph. L. E. & D.), L. "Impure resin prepared from the turpentine of *Abies excelsa*," or Norway spruce fir. (Ph. L.) "A concrete resinous exudation, probably, in a great measure, from *Abies excelsa*. (Ph. E.) It is chiefly used in plasters.

Obs. The importation of this substance has for some years past been gradually lessening in amount, in consequence of the substitution for it of a fictitious pitch, made by melting common resin with linseed oil, and colouring the mass with annotta or palm oil. The physiological action of the two articles is, however, considerably different, since Burgundy pitch acts upon the skin as a powerful local irritant, exciting a slight degree of inflammation, and not unfrequently producing a pimply eruption and an exudation of purulent matter. It is celebrated for its effects when employed as a plaster in all cases where warmth, support, and long adhesion to the skin, are desirable; and in the latter quality no substance equals it. The factitious Burgundy pitch has similar properties, but in an immensely less degree.

PREPARED BURGUNDY PITCH (**PIX BURGUNDICA PREPARATA**—Ph. L.) is ordered to be obtained in the same way as that adopted for strained ammoniacum. This

plan is, however, seldom, if ever, adopted in trade.

Burgundy Pitch (Factitious). *Syn.* PIX BURGUNDICA FACTITIA, L. *Prep.* By melting good yellow resin, 1 cwt., with linseed oil, 1 gall., and palm oil (bright), q. s. to colour. The mixture is allowed to cool considerably, and is then pulled with the hands in the same way as lead plaster is treated; after which it is placed in 'bladders' or 'stands' for sale.

Obs. The product of the above formula is the 'Burgundy pitch' of the shops. The 'pulling' or 'working' destroys the translucency of the resin, and imparts to it the peculiar semi-opacity of foreign Burgundy pitch. Cold water is commonly employed to cool it down. Annotta is often substituted for palm oil as a colouring substance. The addition of some of the 'droppings' or 'bottoms' of Canada balsam, Chio turpentine, oil of juniper, &c., renders this article nearly equal to foreign pitch; but in commerce this is never attempted, the aim being only the production of a lively colour with moderate toughness. A common melting-pan and fire (if clean, and carefully managed) will succeed sufficiently; but, both for safety and convenience, steam is preferable, and on the large scale, almost indispensable. A good workman can pull and put into stands or casks about 5 cwt. daily; or from 1½ cwt. to 3 cwt. in bladders, the latter quantity depending on the size of the bladders. (See *above*.)

Canada Pitch. *Syn.* HEMLOCK GUM, H. PITCH. Similar to Burgundy pitch; but from the *Abies Canadenses*, or hemlock spruce fir.

Jews' Pitch. Asphaltum.

Mineral Pitch. Indurated mineral bitumen. See ASPHALTUM, BITUMEN, &c.

PITCHCOAL. *Syn.* COAL; HOUILLE, Fr.; STEINKOHL, Ger. This article has been truly described as the most valuable of all those mineral substances from which Great Britain derives its prosperity, and the one which may be regarded as the main support of the whole system of British production. It fuses the metals, it produces the steam which sets our machinery in motion, and, in short, it may be said to render all the resources of this country available for use.

The more important kinds of coal may be classified as follows:—1. Lignite or brown coal (see page 691).—2. Bituminous or caking coals. The most widely diffused and valuable of English coals. They are subdivided into:—*a.* Caking coal. Splinters on heating, but the fragments then fuse together in a semi-pasty mass. The chief sources of this valuable variety of coal are the Newcastle and Wigan districts. *b.* Cherry coal or soft coal. Lustre very bright; does not fuse, ignites well and burns rapidly. Glasgow, Staffordshire, Derbyshire, Nottingham, Lancashire, &c. *c.* Splint, rough, or hard coal. Black and glistening; does not ignite readily, but burns up to a clear hot fire. It constitutes

the bulk of the great coal fields of North and South Staffordshire, and occurs in the Glasgow district, in Shropshire, Leicestershire, Warwickshire, &c. *d.* Cannel or parrot coal. Dense and compact, having a shelly fracture, and taking a polish-like jet. Splinters in the fire, and burns clearly and brightly. Wigan and other parts of Lancashire, West Glasgow, &c. The curious deposit at Bathgate, near Edinburgh, commonly known as 'Boghead cannel coal,' or 'Torbanhill mineral,' differs considerably from the ordinary 'cannels.'—3. Anthracite or stone-coal. The densest, hardest, and most lustrous of all kinds of pit-coal. Burns with little flame or smoke, but gives great heat. South Wales, Devonshire, &c.—4. Steam coal. Approaches nearly to anthracite. Admirably adapted for steam-vessels. South Wales, Tyne district, &c.

The quality of coal may be ascertained by either directly testing its heating power or by chemical analysis. In the investigations undertaken at the Museum of Economic Geology, under the directions of Sir H. De la Beche, and which furnished the materials for the celebrated 'Admiralty Reports,' three different methods were adopted for this purpose.¹ These consisted in—the determination of the quantity of water which a given weight of the coal was capable of converting into steam—the quantity of litharge which it was capable of reducing to the metallic state, and, lastly,—its ultimate analysis by combustion with oxide of copper. See ORGANIC SUBSTANCES.

The quantity of sulphur in coal is another matter of importance that may be determined by chemical analysis. (See SULPHUR.) The presence of more than 1½ of sulphur renders coal unfit for the economical production of good light-gas, and more than 2½ of sulphur renders it objectionable for use as domestic fuel. In like manner, coals containing mineral ingredients in excess are to be avoided, not merely on account of the quantity of ashes left by them, but for their tendency to vitrify upon the bars of the furnace, and to produce what is technically called 'clinkers.' The presence of much silica or alumina, and more particularly of any of the salts of lime, in 'steam coal,' is, on this account, highly objectionable.

For some further information connected with this subject, see ANTHRACITE, CHIMNEYS, COKE, FUEL, GAS, LIGNITE, OILS, (Mineral), ORGANIC SUBSTANCES, &c.

PLAICE. The *Platessa vulgaris*, a well-known flat fish, common to both the English and Dutch coasts. Its flesh is good, and easy of digestion, but more watery than that of the flounder.

PLASTER. (In building, &c.) See MORTAR.

Plaster of Paris. Calcined sulphate of lime. See ALABASTER, GYPSUM, LIME, &c.

PLASTER. (In pharmacy.) *Syn.* EM.
¹ See Watts's 'Dict. of Chemistry,' vol. i, page 1088.

PLASTRUM, L. Plasters (emplastra) are external applications that possess sufficient consistence not to adhere to the fingers when cold, but which become soft and adhesive at the temperature of the human body.

Plasters are chiefly composed of unctuous substances united to metallic oxides, or to powders, wax, or resin. They are usually formed, whilst warm, into $\frac{1}{2}$ -lb. rolls, about 8 or 9 inches long, and wrapped in paper. When required for use, a little is melted off the roll by means of a heated iron spatula, and spread upon leather, linen, or silk. The less adhesive plasters, when spread, are usually surrounded with a margin of resin plaster, to cause them to adhere.

In the preparation of plasters, the heat of a water bath, or of steam, should alone be employed. On the large scale, well-cleaned and polished copper or tinned copper pans, surrounded with iron jackets, supplied with high-pressure steam, are used for this purpose. The resins and gum resins that enter into their composition are previously purified by straining. After the ingredients are mixed, and the mass has acquired sufficient consistence by cooling, portions of it are taken into the hands, anointed with a little olive oil, and well pulled or worked until it becomes solid enough to admit of being formed into rolls. To promote the cooling of the plaster it is usual to plunge it into cold water, and to expose it to the action of the fluid by working it about under the surface, after which it is well pulled in the hands to remove the superfluous water; but this process must not, on any account, be practised on compound plasters, containing odorous substances, or substances soluble in water. These should be suffered to cool on an oiled marble slab, until sufficiently 'stiff' to be formed into rolls. Many plasters, as those of lead and resin, derive much of their whiteness and beauty from the treatment just referred to. White plasters are not, however, always the best; but they are those which are most admired, and the most sought after in trade.

Plasters are preserved by enveloping the rolls with paper, to exclude the air as much as possible, and by keeping them in a cool situation. A few, as those of belladonna and ammoniacum with mercury, are commonly placed in pots. When kept for any length of time, they are all more or less apt to become hard and brittle, and to lose their colour. When this is the case, they should be remelted by a gentle heat, and sufficient oil added to the mass to restore it to a proper consistence.

The operation of spreading plasters for use requires skill and experience on the part of the operator. Various textures are employed for the purpose, of which linen or cotton cloth, or leather, are those most generally employed. Silk and satin are used for 'court plaster.'

The shape and size must be regulated by the part to which they are to be applied.

On the large scale plasters are spread by means of a 'spreading machine.'

Compound plasters are now much less frequently employed in medicine than formerly. Those principally in use are such as afford protection to sores and abraded surfaces, and give support to the parts. A few, however, which contain acrid, stimulating, and narcotic substances, and operate as rubefacients, blisters, or anodynes, are still retained in the Pharmacopæias.

Plaster of Ac'onite. *Syn.* EMPLASTRUM ACONITII, L. *Prep.* (Curtis.) Gently evaporate tincture of aconite to the consistence of a soft extract, then spread a very small portion over the surface of a common adhesive plaster, on either calico or leather. Mr. Curtis has strongly recommended this plaster in neuralgia. A little of the alcoholic extract may be employed instead of that obtained fresh from the tincture.

Adhe'rent Plaster. See SOAP PLASTER (Compound).

Adhe'sive Plaster. See RESIN PLASTER, COURT P., &c.

Ammoni'acal Plaster. *Syn.* DR. KIRKLAND'S VOLATILE PLASTER; EMPLASTRUM AMMONIÆ, E. A. HYDROCHLORATIS, L. *Prep.* Take of lead plaster, 1 oz.; white soap (shaved fine), $\frac{1}{2}$ oz.; melt them together, and, when nearly cold, add of sal ammoniac (in fine powder), 1 dr. Stimulant and rubefacient. Dr. Paris, who highly recommends it in pulmonary affections, employs double the above proportion of sal ammoniac. Its efficacy depends on the gradual extrication of free ammonia by the decomposition of the sal ammoniac, on which account it is proper to renew the application of it every 24 hours.

Plaster of Ammoni'acum. *Syn.* EMPLASTRUM AMMONIACI (Ph. L. E. & D.), L. *Prep.* 1. (Ph. L. & E.) Ammoniacum (strained), 5 oz.; dilute acetic acid (distilled vinegar), 8 fl. oz. (9 fl. oz.—Ph. E.); dissolve, and, frequently stirring, evaporate by a gentle heat, to a proper consistence.

2. (Ph. D.) Gum ammoniacum (in coarse powder), 4 oz.; proof spirit, 4 fl. oz.; dissolve by the aid of a gentle heat, and evaporate, as before.

Obs. This plaster is adhesive, stimulant, and resolvent, and is employed in scrofulous and indolent tumours, white swellings, &c. In the Ph. D. 1826 vinegar of squills was ordered instead of distilled vinegar.

Plaster of Ammoniacum with Hem'lock. *Syn.* EMPLASTRUM AMMONIACI CUM CUCUTÆ, L. *Prep.* (Ph. E. 1744.) Gum ammoniacum, 8 oz.; vinegar of squills, q. s. to dissolve; hemlock juice, 4 oz.; gently evaporate, as before. In cancerous and other painful tumours. A better plan is to add 1 dr. of extract of hemlock to $\frac{1}{2}$ oz. of strained ammoniacum (previously reduced to a proper consistence with a

little distilled vinegar), melted by a very gentle heat.

Plaster of Ammoniacum with Mercury. *Syn.* EMPLASTRUM AMMONIACI CUM HYDRARGYRO (B. P., Ph. L. E. & D.), *L. Prep.* 1. (Ph. L. & E.) Olive oil, 1 dr.; heat it in a mortar, add of sulphur, 8 grs.; triturate; further add of mercury, 3 oz.; again triturate, and, when the globules are extinguished, add it to ammoniacum (strained), 1 lb. (12 oz., B. P.), previously melted by a gentle heat, and mix them well together.

2. (Ph. D.) From ammoniacum plaster, 4 oz.; mercurial plaster, 8 oz.; melted together by a gentle heat, and then stirred constantly, until nearly cold.

3. (*Wholesale.*) Take of mercury, 38 oz.; prepared sebum, 5 oz.; triturate, as last, and add the mixture to strained ammoniacum, 10 lbs., previously sufficiently softened by a gentle heat. Possesses a fine blue colour, and is quickly made.

Obs. This plaster cannot be rolled till considerably cooled, and neither this nor the simple plaster must be put into water. It is powerfully discutient, and is applied to indurated glands, indolent tumours, &c.

Anodyne Plaster. See OPIUM PLASTER, BELLADONNA P., &c.

Antimo'nial Plaster. *Syn.* EMPLASTRUM ANTIMONIALE, E. ANTIMONII POTASSIO-TARTARIS, *L. Prep.* (U. C. Hosp.) By sprinkling tartar emetic, in very fine powder, on the surface of a spread Burgundy pitch (or common adhesive) plaster. It has been successfully applied to the nape of the neck, in the scarlatina of children; also the chest, in phthisis; and, with the addition of a little opium, in rheumatic affections of the joints.

Aromatic Plaster. *Syn.* STOMACH PLASTER; EMPLASTRUM AROMATICUM, *L. Prep.* (Ph. D. 1826.) Strained frankincense (thus), 3 oz.; bees' wax, $\frac{1}{2}$ oz.; melt them together, and, when the mass has considerably healed, add, of powdered cinnamon, 6 drs.; oils of allspice and lemons, of each 2 drs. Stimulant; applied over the stomach in dyspepsia, spasms, nausea, flatulence, &c. Camphor, 1 dr., is commonly added.

Plaster of Assafoetida. *Syn.* ANTIHYSTERIC PLASTER, ANTISPASMODIC P.; EMPLASTRUM ASSAFOETIDÆ (Ph. E.), E. ANTIHYSTERICUM, &c., *L. Prep.* (Ph. B.) From lead plaster and strained assafoetida, of each, 2 oz.; strained galbanum and bees' wax, of each, 1 oz.; melted together. Antispasmodic; applied to the stomach or abdomen in spasms, hysteria, &c.; and to the chest in hooping-cough.

Baynton's Adhesive Plaster. *Prep.* From yellow resin, 1 oz.; lead plaster, 1 lb.; melted together. Recommended for bad legs, and other like sores.

Plaster of Belladonna. *Syn.* EMPLASTRUM BELLADONNÆ (B. P., Ph. L. E. & D.), *L. Prep.* 1. (Ph. L.) Soap plaster, 3 oz.; melt it by the heat of a water bath; add of extract of bella-

donna (deadly nightshade), 3 oz.; and keep constantly stirring the mixture until it acquires a proper consistence.

2. (Ph. E.) Resin plaster, 3 oz.; extract of belladonna, $\frac{1}{2}$ oz.; as the last.

3. (Ph. D.) Resin plaster, 2 oz.; extract of belladonna, 1 oz.

4. (B. P.) Extract of belladonna, 3; resin plaster, 3; rectified spirit, 6; rub the extract and spirit together in a mortar, and when the insoluble matter has subsided, decant the clear solution, remove the spirit by distillation or evaporation, and mix the alcoholic extract thus obtained with the resin plaster melted at the heat of a water bath, continuing the heat until with constant stirring the plaster has acquired a suitable consistence.

Uses, &c. As a powerful anodyne and antispasmodic; in neuralgia and rheumatic pains, and as an application to painful tumours. The plaster of the shops is usually deficient in extract. The following formula is in common use in the wholesale trade:—Lead plaster and resin plaster, of each, 2 $\frac{1}{2}$ lbs.; extract of belladonna, $\frac{1}{2}$ lb. This plaster must not be 'pulled' in water.

Berg's Antirheumatic Plaster. *Syn.* GOUT PAPER; EMPLASTRUM ANTIRHEUMATICUM, CHARTA ANTIRHEUMATICA, *L. Prep.* By digesting euphorbium, 2 parts, and cantharides, 1 part, (both in powder,) in rectified spirit, 10 parts, for eight days; adding to the strained liquid, black resin and Venetian turpentine, of each, 4 parts; assisting the mixture by a gentle heat. Two or three coats of the product are successively spread over the surface of thin paper. *Used* in gout and rheumatism. ('Aquat. of Quackery.')

Black Diach'ylon Plaster. See CUPRET PLASTER.

Plaster of Black Pitch. *Syn.* EMPLASTRUM PICIS NIGRÆ, *L. Prep.* (Ph. Wirtem.) Black pitch, black resin, and bees' wax, of each, 8 parts; suet, 1 part; melted together. Rubefacient and stimulant.

Blistering Plaster. See PLASTER OF CANTHARIDES.

Bree's Antiasthmatic Plaster. *Prep.* From lead plaster, 1 oz.; olive oil, 1 dr.; melted together, and, when somewhat cooled, mixed with powdered camphor, 2 drs.; powdered opium, 1 dr., and at once spread on leather.

Brown Plaster. *Syn.* EMPLASTRUM RUSCUM, *L.*; ONGUENT DE LA MÈRE, *Fr.* This is noticed at page 862. The butter, lard, oil, suet, and wax, should be first melted together, and the heat gradually increased until they begin to smoke; the litharge is then to be sifted in, and the stirring and heat continued until the mixture assumes a brown colour; the pitch is next added, and the whole stirred for some time longer.

Brown Diach'ylon Plaster. See PLASTER OF GALBANUM.

Plaster of Burgundy Pitch. *Syn.* CEPHALIC PLASTER, BURGUNDY P., BURGUNDIAN PITCH

polished, and of these 1 dozen are put into each box.

3. (Le Foret.) Galbanum plaster, 2 oz.; melt by a very gentle heat; add, sal ammoniac and saffron, of each, $\frac{1}{2}$ oz.; powdered camphor, 2 oz.; and, when nearly cold, stir in of liquor of ammonia, 2 oz. Applied, spread on leather, to the corn only, as it will blister the thinner skin surrounding its base.

4. (Ph. Sax.) Galbanum plaster, 1 oz.; pitch, $\frac{1}{2}$ oz.; lead plaster, 2 drs.; melt them together, and add verdigris and sal ammoniac (in fine powder), of each, 1 dr. For other formulae, see VERDIGRIS PLASTER (*below*), and COBENS.

Plaster, Court. *Syn.* STICKING PLASTER, ISINGLASS P.; EMPLASTRUM ICHTHYOCOLLÆ, E. ADHESIVUM ANGLICUM, L. *Prep.* 1. Isinglass, 1 part; water, 10 parts; dissolve, strain the solution, and gradually add to it of tincture of benzoin, 2 parts; apply this mixture, gently warmed, by means of a camel-hair brush, to the surface of silk or sarcenet, stretched on a frame, and allow each coating to dry before applying the next one, the application being repeated as often as necessary; lastly, give the prepared surface a coating of tincture of benzoin or tincture of balsam of Peru. Some manufacturers apply this to the unprepared side of the plaster, and others add to the tincture a few drops of essence of ambergris or essence of musk.

2. (Deschamps'.) A piece of fine muslin, linen, or silk, is fastened to a flat board, and a thin coating of smooth, strained flour paste is given to it; over this, when dry, two coats of colourless gelatine, made into size with water, q. s., are applied warm. Said to be superior to the ordinary court plaster.

3. (Liston's.) Soak isinglass, 1 oz., in water, 2 $\frac{1}{2}$ fl. oz., until it becomes swollen and quite soft; then add of proof spirit, 3 $\frac{1}{2}$ fl. oz., and expose the mixture to the heat of hot water, frequently stirring, until the union is complete; lastly, apply four coats of the solution to the surface of oiled silk nailed to a board, by means of a soft brush.

4. (Dr. Paris.) Black silk or sarcenet is strained and brushed over 10 or 12 times with the following composition:—Gum benzoin, $\frac{1}{2}$ oz.; rectified spirit, 6 oz.; dissolve. In a separate vessel dissolve of isinglass, 1 oz., in as little water as possible; strain each solution, mix them, decant the clear portion, and apply it warm. When the last coating is quite dry, a finishing coat is given with a solution of Chio turpentine, 4 oz., in tincture of benzoin, 6 oz.

Obs. The common 'COURT PLASTER' of the shops is generally prepared without using spirit, and with merely sufficient tincture of benzoin, or other aromatic, to give it an agreeable odour. Formerly, black silk or sarcenet was exclusively employed as the basis of the plaster, but at the present time checkered silk is also much in favour. 'FLESH-COLOURED

COURT PLASTER' is likewise fashionable. 'TRANSPARENT COURT PLASTER' is prepared on oiled silk. 'WATERPROOF COURT PLASTER' is simply the common plaster which has received a thin coating of pale drying oil on its exposed surface. The FINEST COURT PLASTER of the West-end houses is now prepared on gold-beaters' skin (or the prepared membrane of the cæcum of the ox), one side of which is coated with the isinglass solution, as above, and the other with pale drying oil or a solution of either gutta percha or caoutchouc in chloroform, or in bisulphuret of carbon.

Plaster of Croton Oil. *Syn.* EMPLASTRUM CROTONIS, E. OLEI TIGLII, L. *Prep.* (Bouchardat.) To lead plaster, 4 parts, melted by a very gentle heat, add of croton oil, 1 part. A powerful counter-irritant; it also generally acts powerfully on the bowels.

Plaster of Cum'in. *Syn.* EMPLASTRUM CUMINI (Ph. L.), E. CYMINI, L. *Prep.* 1. (Ph. L.) Burgundy pitch, 3 lbs.; bees' wax, 3 oz.; melt, add of cumin seed, caraways, and bay-berries, of each (in powder), 3 oz.; next add of olive oil and water, of each, 1 $\frac{1}{2}$ fl. oz., and evaporate to a proper consistence.

2. (Wholesale.) From yellow resin, 7 lbs.; bees' wax and linseed oil, of each, $\frac{1}{2}$ lb.; powdered cumin and caraway seeds, of each, 7 oz.; mix.

Obs. This is a mere revival of the formula of the Ph. L. 1724. In that of the Ph. L. 1788 no water was ordered, and the powders simply stirred into the melted mass shortly before it cools; the common practice in all laboratories.

Cumin plaster is carminative, stimulant, and discutient. It is applied over the regions of the stomach and bowels in colic, dyspepsia, and flatulence, and is also applied to indolent tumours. It has long been a favourite remedy with the lower classes.

Delacroix's Agglutinative Plaster. *Syn.* EMPLASTRUM GLUTINANS SANCTI ANDRÆ À CRUCE, E. PICIS CUM ELEMI; L. EMPLÂTRE D'ANDRÉ LE LA CROIX, Fr. *Prep.* (P. Cod.) From Burgundy pitch, 25 parts; gum elemi, 6 parts; Venice turpentine and oil of bays, of each, 3 parts; melted together, and strained.

Plaster, Diach'ylon. See LEAD PLASTER.

Plaster, Diapalma. See PALM PLASTER.

Plaster of Elemi. *Syn.* EMPLASTRUM ELEMI, L. *Prep.* From wax plaster, 3 parts; gum elemi, 1 part; melted together by a gentle heat. Stimulant and discutient. *Used* for issues, &c.

Plaster of Euphorbium. *Syn.* EMPLASTRUM EUPHORBII, L. *Prep.* 1. (Guy's Hosp.) Burgundy pitch plaster, 8 oz.; melt, and add of euphorbium (in powder), 1 dr.

2. (CAPUCHIN PLASTER—Ph. Wirt.) Burgundy pitch and bees' wax, of each, 3 oz.; Venice turpentine, 1 oz.; melt them together, add, gum ammoniacum, olibanum, mastic, and lapis calaminaris, of each, 1 oz.; euphorbium,

possesses the property of condensing gases, more especially oxygen, into its pores, and afterwards giving it out to various oxidisable substances. When placed in contact with a solution of formic acid, it converts it, with copious effervescence, into carbonic acid; alcohol, dropped upon it, becomes changed by oxidation into acetic acid, the rise of temperature being often sufficient to cause inflammation; exposed to a red heat, it shrinks in volume, assumes the appearance of common spongy platinum, and, for the most part, loses these peculiarities. That prepared with zinc explodes, when heated, like gunpowder. The spongy platinum is obtained by igniting the ammonium platonic chloride at a red heat.

The salts of platinum are recognised as follows:—Sulphuretted hydrogen throws down from neutral and acid solutions of the platonic salts a blackish-brown precipitate, which is only formed after a time in the cold, but immediately on heating the liquid. Ammonium sulphide also gives a blackish-brown precipitate, which completely redissolves in a large excess of the precipitant, provided the latter contains an excess of sulphur.

Chloride of ammonium and chloride of potassium give yellow crystalline precipitates, insoluble in acids, but soluble in excess of the precipitate, upon the application of heat, and decomposable by heat, with production of spongy platinum. Ammonia and potassium hydrate also give similar precipitates in solutions previously acidulated with hydrochloric acid.

Estim. This may be effected by throwing down the metal under the form of chloride of ammonium and platinum, which, after being washed on a filter with a little weak spirit to which a little of the precipitate has been added, and afterwards with the spirit alone, may be carefully dried at 212° Fahr., and weighed. Or, the precipitate may be ignited in a platinum crucible, and weighed under the form of a spongy platinum. 198.25 grs. of the platonic and ammonium chlorides are equivalent to 98.75 grs. of metallic platinum.

Uses. Platinum is valuable for the formation of crucibles, capsules, and other utensils or instruments intended to be exposed to a strong heat, or to the action of acids. Platonic chloride and the platonic and sodium chloride are much used in chemical analysis. Both of these are also used in medicines with the same intentions, and in the same doses, as the corresponding salts of gold. These compounds are poisonous. The antidotes and treatment are similar to those described under Gold.

Concluding remarks.—Davy and Debrau have recently introduced a method of refining platinum, which has already done much to extend the useful applications of the metal. The process consists in submitting the crude metal to the action of an intensely high temperature, obtained by the combustion of hydrogen (or

coal-gas) with oxygen, in a crucible of lime. By this means large quantities of platinum (50 lbs. or more) can be kept fused until the sulphur, phosphorus, arsenic, and osmium, generally occurring in crude platinum, are oxidised and volatilised, and the iron and copper are oxidised and absorbed by the lime forming the crucible. At the International Exhibition of 1862 an ingot of pure platinum, weighing over 2 cwt., was exhibited by Messrs. Johnson & Mathey, as an illustration of the practical results of this process.

Platonic Chloride. PtCl_4 . *Syn.* BICHLORIDE OF PLATINUM, CHLORIDE OF PLATINUM, PERCHLORIDE OF P.; PLATINI BICHLORIDUM (Ph. L.), L. *Prep.* By dissolving platinum in nitro-hydrochloric acid, and evaporating the solution to dryness at a gentle heat. *Prop.* &c. Reddish-brown, deliquescent, and very soluble in both water and alcohol, yielding orange-coloured solutions. It combines with a variety of metallic chlorides to form 'double salts.' *Used* as a test in chemical analysis, and as an alternative in secondary syphilis, &c. —*Dose.* $\frac{1}{16}$ to $\frac{1}{4}$ gr., dissolved in distilled water, or made into a pill with syrup and liquorice powder. Some persons prescribe much larger doses, but unsafely. Hoefer recommends an ointment made with it as an application to indolent ulcers. In doses of 5 grs. and upwards, it acts as a violent caustic poison. This last salt is the 'chloride of platinum' of the shops, and the one used in the arts and medicine. It forms one of the tests included in the 'Appendix' to the Ph. L.

Platonic-Ammonium Chloride. $\text{Pt}(\text{NH}_4)_2\text{Cl}_6$, or $\text{PtCl}_4 \cdot 2\text{NH}_4\text{Cl}$. *Syn.* AMMONIO CHLORIDE OF PLATINUM, PLATINO-CHLORIDE OF AMMONIUM. *Prep.* A solution of chloride of ammonium is added to a strong solution of platonic chloride, and the precipitate washed with dilute alcohol.

Prop. Minute, transparent, yellow octahedral crystals; very feebly soluble in water, less so in dilute alcohol, and insoluble in acids; heat converts it into spongy platinum.

Platonic-Potassium Chloride. PtK_2Cl_6 , or $\text{PtCl}_4 \cdot 2\text{KCl}$. *Syn.* PLATINO-CHLORIDE OF POTASSIUM, POTASSIO-CHLORIDE OF PLATINUM. *Prep.* A bright yellow, crystalline precipitate, formed whenever solutions of the chlorides of platinum and of potassium are mixed; or: salt of potassium, acidulated with a little hydrochloric acid, is added to platonic chloride. Its appearance, solubility, &c., it closely resembles ammonio-chloride of platinum.

Platonic-Sodium Chloride. PtNa_2Cl_6 , or $\text{PtCl}_4 \cdot 2\text{NaCl}$. *Syn.* CHLORIDE OF PLATINUM AND SODIUM, SODIO-CHLORIDE OF PLATINUM, PLATINO-BICHLORIDE OF SODIUM; PLATINI ET SODII CHLORIDUM, PLATINI SODIO-CHLORIDUM, &c., L. *Prep.* (Redwood.) Platonic chloride, 17 parts; chloride of sodium, 6 parts; dissolve the two salts separately in water, q. s., mix the solutions, and evaporate, that crystals may form. The crystals are large, transparent,

and of a yellow-red colour.—*Dose.* $\frac{1}{2}$ to $\frac{1}{2}$ gr.; in the same cases as the bichloride.

Platinous Oxide. PtO . *Syn.* OXIDE OF PLATINUM. *Prep.* By heating to below redness the platinic chloride and digesting with hydrate of potassium the residue.

Prop., &c. A black powder, soluble in excess of alkali, and freely so in the acids, forming brown solutions of the platinous salts. These are distinguished from solutions of the platinic salts by not being precipitated by chloride of ammonium. Platinous oxalate, in fine copper-coloured needles, may be obtained by heating platinic oxide in a solution of oxalic acid.

Platinic Oxide. PtO_2 . *Syn.* BINOXIDE OF PLATINUM. *Prep.* 1. By exactly decomposing the platinic sulphate with nitrate of barium, and adding pure hydrate of sodium to the filtered solution, so as to precipitate only half the oxide. (Berzelius).—2. By boiling platinic chloride with hydrate of sodium, in considerable excess, and then adding acetic acid.

Prop., &c. As the hydrate ($\text{Pt}(\text{HO})_4$), it is a bulky brownist powder; this, when gently heated, becomes black and anhydrous. It forms salts with the acids, and combines with some of the bases. The salts have a red or yellow colour, and a remarkable tendency to form double salts with the alkaline salts.

Obs. Both the oxides of platinum are reduced to the metallic state on ignition.

Platinum, Spongy. *Prep.* 1. By heating ammonio-chloride of platinum to redness.

2. Crude bichloride of platinum and chloride of ammonium are separately dissolved in proof spirit, and the one solution added to the other as long as a precipitate forms; this is collected, and, whilst still moist, formed into little balls or pieces, which are then dried, and gradually heated to redness.

Prop., &c. These have been noticed above. Small balls of spongy platinum are used for the hydrogen instantaneous-light lamp (Dobereiner's lamp); but they are apt to absorb moisture from the atmosphere, and then lose their power of inflaming hydrogen, until they are re-dried and heated.

PLUGGING. The introduction of a mass of lint, sponge, or other suitable material, into a wound or cavity, with the intention of arresting hæmorrhage. It is now seldom adopted, except in cases of bleeding from the nose, and that only after more approved methods have failed.

PLUM. A name applied to several varieties of the *Prunus domestica* (Linn.), or wild plum. Among the cultivated varieties, the damson, greengage, French plum, magnum bonum or Mogul p., mirabelle p., Orleans p., and prune, are those best known. Grocers' 'plums' are raisins, or dried grapes.

PLUMBAGO. *Syn.* GRAPHITE, BLACK-LEAD. One of the native forms of carbon. It contains

from 95 to 100% of pure carbon; has a metallic lustre, and conducts electricity nearly as well as the metals. It was formerly regarded as a carbide of iron, but the iron generally found is now known to be merely in a state of mixture. There are two distinct varieties of graphite—crystallised or foliated graphite, obtained chiefly from Ceylon; and amorphous graphite (the ordinary plumbago or black-lead), largely imported to this country from Germany. The Borrowdale mine in Cumberland, from which the finest black-lead was formerly derived, is now nearly exhausted. The foliated graphite of Ceylon and other parts is the principal material employed for making plumbago crucibles and other fire-resisting goods. The amorphous graphite is used for making black-lead pencils, polishing powder for stoves and grates ('lustre,' 'servant's friend,' &c.), and to diminish friction in heavy machinery (anti-friction powder). Its powder is also used to give conducting surfaces to articles on which it is desired to deposit copper by the electrotype. In medicine, plumbago has been used with apparent advantage, in herpes and several chronic skin diseases—externally, as an ointment made with four times its weight of lard; and internally, made into pills.

Purification. For medical and chemical use, graphite may be treated as follows:—

1. (Dumas and Stas.) Heat it to redness with caustic potassa, in a covered crucible, then wash it well with water, boil it in nitric acid, and in aqua regia, again wash it with water, dry it, and expose it at a white heat to a stream of dry chlorine gas; lastly, wash it with water, and again heat it to dull redness. In analysis.

2. (Ph. Bor.) Pure native plumbago, 1 lb., is boiled in water for 1 hour, then drained, and digested, for 24 hours, in a mixture of water, 8 oz.; nitric acid and hydrochloric acid, of each, 2 oz.; it is, lastly, well washed with water, and dried.

3. (Brodie's patent.) This process is only applicable to the hard varieties of graphite, as that of Ceylon. It consists in introducing coarsely powdered graphite, previously mixed with $\frac{1}{10}$ th of its weight of chlorate of potassa, into 2 parts of concentrated sulphuric acid, which is heated in a water bath until the evolution of acid fumes ceases. The acid is then removed by water, and the graphite dried. Thus prepared, this substance, when heated to a temperature approaching a red heat, swells up to a voluminous mass of finely divided graphite. This powder, which is quite free from grit, may be afterwards consolidated by pressure, and used for making pencils or other purposes.

PLUMBIC ACID. Bin oxide of lead occasionally receives this name on account of its combining with some of the bases to form compounds which have been called plumbates.

PLUMBUM CORNEUM. See CHLORIDE OF LEAD.

PLUMOSE ALUM. The old name of the silky amianthine crystals of the double sulphate of aluminum and iron occasionally found on alum slate. Asbestos has also been so called.

PLUNKET'S CANCER REMEDY. See PLUNKET'S CAUSTIC.

POACHING. Amongst cooks, a peculiar method of cooking small articles by a slight boiling or stewing process.

POACHED EGGS are prepared by breaking them into a small saucepan or stewpan containing about $\frac{1}{2}$ a pint of boiling water, to which a teaspoonful of common salt, and, occasionally, a little vinegar, is added, and gently simmering them for 3 or 4 minutes, or until sufficiently firm to bear removal with a spoon or 'slice.' Another method is to employ melted butter, instead of water, and to dress them either with or without stirring.

Poached eggs are commonly served on toast, or with fried ham or bacon, with spice or vegetable seasoning at will. They form an excellent breakfast, or 'make-shift dinner.'

PODOPHYLLIN. *Syn.* RESIN OF PODOPHYLLUM; RESINA PODOPHYLLI (B. P.). Obtained from the root of the *Podophyllum peltatum* (Linn.), or may-apple, a substance officinal in the Ph. U. S.

Prep. 1. The alcoholic extract of may-apple is digested in cold ether, to remove fatty matter, and is then dissolved in rectified spirit; the solution is decoloured with a little animal charcoal, and filtered; it is, lastly, allowed to evaporate spontaneously.

2. (B. P.) Podophyllum, in coarse powder, 1 $\frac{1}{2}$, rectified spirit, 3 $\frac{1}{2}$, or a sufficiency; distilled water and hydrochloric acid, of each a sufficiency; exhaust the podophyllum by percolation with the spirit; distil over the spirit; slowly pour the liquid remaining after the distillation of the tincture into three times its volume of water acidulated with $\frac{1}{4}$ th part of its weight of hydrochloric acid, constantly stirring; let it stand 24 hours; collect the resin which falls, wash on a filter with distilled water, and dry in a stove. Cholagogue purgative; used as a substitute for calomel.—*Dose.* $\frac{1}{2}$ to $\frac{1}{4}$ gr., or even 2 grs. It is best to begin with $\frac{1}{8}$ gr. (Squire.)

Prop., &c. An amorphous, grayish-white mass, soluble in alcohol, and slightly soluble in water. It is a safe and certain cathartic, superior in activity to resin of jalap.—*Dose.* $\frac{1}{2}$ to 3 grs. See EXTRACT OF MAY-APPLE.

PODOPHYLLUM ROOT. *Syn.* PODOPHYLLI RADIX (B. P.). The dried rhizome of the *Podophyllum peltatum*; imported from North America. Active and certain cathartic.—*Dose.* 10 to 20 grs.

POISON. *Syn.* TOXICUM, VENENUM, L. Any substance which, when swallowed, or applied in any particular way to the living body, disturbs, suspends, or destroys one or more

of the vital functions. In sufficient quantity, or in small doses long continued, the common result of the administration of deleterious substances is either impaired vitality or death.

Poisons are classified by Orfila under four heads:—

1. **IRRITANT POISONS**, or such as inflame or corrode the parts with which they come in contact. Their chief effects are upon the alimentary canal, with, sometimes, ulceration of the tongue, fauces, and oesophagus. Nausea, vomiting, stomachic and intestinal pains, extreme anxiety and anguish, quick and feeble pulse, cold and clammy skin, and mucous, bilious, or bloody diarrhoea, are among the common leading symptoms. Arsenic, blue vitriol, verdigris, strong acids and alkalies, drastic purgatives, and numerous other substances, belong to this class.

2. **NARCOTIC or STUPEFYING POISONS**, or such as paralyse the functions of the nervous system, and produce headache, vertigo, confused vision, delirium, stupor, convulsions, coma, &c. It includes morphia, opium, henbane, oil of bitter almonds, prussic acid, &c.

3. **NARCOTICO-ACRID POISONS**, which produce at the same time narcotism and irritation of the parts with which they touch. Alcohol, belladonna, cocculus Indicus, colchicum, foxglove, hemlock, poisonous fungi, strychnine, tobacco, veratrine, &c., are of this kind.

4. **SEPTIC or PUTREFIANT POISONS**, including all those which alter, liquefy, or cause the putrescence of the fluids of the body; as sulphuretted hydrogen, the gas from sewers and cesspools, putrefying organic matter, miasmata, &c.

The treatment of cases of poisoning varies with the substance occasioning it; and, with the proper antidotes, will be found noticed under the names of the various substances that exert a deleterious action on the animal body. It may here, however, be useful to remark, that in almost all cases of poisoning copious vomiting should be excited as soon as possible by the administration of a powerful emetic; its action being promoted by copious draughts of lukewarm water, tickling the throat with the finger, &c. Should this fail, but not otherwise, the stomach-pump should be had recourse to. The vomiting should be kept up and the stomach well washed out with bland albuminous or mucilaginous liquids, such as milk-and-water, barley water, sweetened water, flour-and-water, or any similar matters, as circumstances may afford. After the vomiting a brisk aperient draught, or clyster, may be administered, and nervous irritability or exhaustion allayed by means of ether, opium, wine, or warm spirit-and-water, as the case may require. Even in a suspected case of poisoning, when proper medical advice is not at hand, an emetic should be immediately taken or administered. Vomiting may be, in general, produced very promptly by merely swallowing a cupful of

the pommade should be opaque and white, it is assiduously stirred or beaten with a glass or wooden knife, or spatula, until it concretes; but when it is desired that it should appear transparent or crystalline, it is allowed to cool very slowly, and without being disturbed. To prevent the accession of rancidity, a little benzoic acid, gum benzein, or nitric ether, may be added to the fat, whilst in the liquid state, as noticed under **FAT** and **ONIMENT**. Sometimes a small portion of white wax or bees' wax (according to the intended colour of the product) is melted with the fat, to increase its solidity. Some parties employ a few grains of powdered citric acid per ounce, in a like manner, with the intention of increasing the whiteness of the compound; but the practice is not to be commended, as pommaades so prepared prove injurious to the hair.

The French perfumers, who are celebrated for the variety and excellence of their pommaades, divide them into four classes:—

1. **POMMADES BY INFUSION.** These are made by gently melting in a clean pan, over a water bath, 2 parts of hog's lard, and 1 part of beef suet (both of the finest quality, and carefully 'rendered'), and adding thereto 1 part of the given flowers, previously carefully picked and separated from foreign matter; or, if the odorous substance is a solid, then coarsely bruised, but not reduced to fine powder. The mixture is next digested at a very gentle heat for from 12 to 24 hours, with occasional stirring, the vessel being kept covered as much as possible during the whole time. The next day the mixture is reheated, and again well stirred for a short time, after which it is poured into canvas bags, and these being securely tied, are submitted to powerful pressure, gradually increased, in a screw or barrel press. This operation is repeated with the same fat and fresh flowers, several times, until the pommade is sufficiently perfumed. A good pommade requires thrice to six times its weight in flowers to be thus consumed; or of the aromatic barks and seeds a corresponding proportion. The pommaades of cassia, orange flowers, and several others kept by the French perfumers, are prepared in this manner.

2. **POMMADES BY CONTACT (ENFLEURAGE).** These are made by spreading, with a palette knife, simple pommade (made with lard and suet as above) on panes of glass or pewter plates, to the thickness of a finger, and sticking the surface all over with the sweet-scented flowers. These last are renewed daily for one, two, or three months, or until the pommade has become sufficiently perfumed. On the large scale, the panes are placed in small shallow frames, made of four pieces of wood nicely fitted together, and are then closely piled one upon another. On the small scale, pewter plates are generally used, and they are inverted one over the other. In some of the perfumeries of France many thousands of frames are employed at once. The pommaades

of jasmin, jonquil, orange-flowers, narcissus, tuberoses, violet, and of some other delicate flowers, are prepared in this manner.

3. **POMMADES BY ADDITION.** These are prepared by simply adding the fragrant essences or essential oils, in the required quantity, to the simple pommade of lard and suet to produce the proper odour. In this way the pomades of bergamotte, cédrat, cinnamon, lemons, lemon thyme, lavender, limettes, marjoram, Portugal, roses, rosemary, thyme, verbenas, and about 40 others kept by the Parisian perfumers, are made.

4. **MIXED POMMADES.** Of these a great variety exists, prepared by the addition of judicious combinations of the more esteemed perfumes to simple pommade; or, by the admixture of the different perfumed pommaades, whilst in the semi-liquid state. (See *below*.)

The **COLOURED POMMADES** derive their respective tints from tinctorial matter added to the melted fat before perfuming it. **GREEN** is given by gum guaiacum (in powder), or by the green leaves or tops of spinach, parsley, lavender, or walnut;—**RED**, by alkanet root and carmine;—**YELLOW** and **ORANGE**, by annatto or palm oil;—**WHITE POMMADES** are made with mutton suet, instead of beef suet. The **BROWN** and **BLACK** hard pommatums, vendes under the name of 'COSMETIQUE,' are noticed at page 372. A few compound pommaades are used as skin cosmetics.

Pommade. Syn. POMATUM. Prep. 1 (**PLAIN POMATUM, SIMPLE P.**)—*a.* From lard 2 lbs.; beef suet, 1 lb.; carefully rendered as above. The ordinary consistence for temperate climates.

b. Lard and suet, equal parts. For warm climates. Both may be scented at will.

2. (**SCENTED POMATUM.**)—*a.* Plain pomatum 1 lb.; melt it by the least possible degree of heat, add of essence of lemon or essence of bergamot, 3 drs., and stir the mixture until it concretes. This forms the ordinary 'pomatum' of the shops.

b. Plain pomatum, 1½ lb.; essence of bergamot, 1½ dr.; essence of lemon, 1 dr.; oils of rosemary and cassia, or each, ½ dr.; oil of cloves, 20 drops. More fragrant than the last.

Pommade, Castor Oil. Prep. 1. From castor oil, 1 lb.; white wax, 4 oz.; melt them together, then add, when nearly cold, of essence of bergamot, 3 drs.; oil of lavender (English), ½ dr.; essence of ambergris, 10 drops. Supposed to render the hair glossy.

2. (**Crystallised.**) From castor oil, 1 lb.; spermaceti, 3 oz.; melt them together, by a gentle heat, add of essence of bergamot, 3 drs.; oil of verbena, lavender, and rosemary, of each, ½ dr.; pour it into wide-mouthed glass bottles, and allow it to cool very slowly and undisturbed.

Pommade, Cazenave's. Prep. From prepared beef marrow, 4 oz.; tincture of cantharides (P. Cod.). 3 to 4 drs.; powdered cin-

namon, $\frac{1}{2}$ oz.; melt them together, stir until the spirit has, for the most part, evaporated, then decant the clear portion, and again stir it until it concretes. Recommended as a remedy for baldness and weak hair. It is to be used night and morning; the head being washed with soap-and-water, and afterwards with salt-and-water, before applying it. Dr. Cattell scents it with the oils of origanum and bergamot, instead of cinnamon.

Pommade Collante. *Prep.* 1. Oil of almonds, $\frac{3}{4}$ oz.; white wax, $\frac{1}{2}$ oz.; melt them together, and add, of tincture of mastic (strong), 1 oz.; essence of bergamot, $\frac{1}{2}$ dr. *Used* to stiffen the hair, and keep it in form.

2. Burgundy pitch (true), 3 oz.; white wax, 2 oz.; lard, 1 oz.; melt, and, when considerably cooled, stir in, of tincture of benzoin, 1 oz.; essence of bergamot, $\frac{1}{2}$ dr. *Used* to fasten false curls.

Pommade, Cowslip. *Prep.* From plain pommade, 2 lbs.; essence of bergamot, 3 drs.; essence of lemon and essence of orange peel, of each, 1 dr.; huile au jasmin and essence de petit grain, of each, $\frac{1}{2}$ dr.; essence of ambergris, 6 drops.

Pommade, Crystallised. *Prep.* From olive oil and spermaceti, as crystallised castor oil pommade, with scent at will.

Pommade d'Alyon. Ointment of nitric acid (page 853).

Pommade de Beaute. *Prep.* From oil of almonds, 2 oz.; spermaceti, 2 drs.; white wax, $\frac{1}{2}$ dr.; glycerin, 1 dr.; balsam of Peru, $\frac{1}{2}$ dr.; mixed by a gentle heat. *Used* as a skin cosmetic, as well as for the hair.

Pommade de Casse. *Prep.* From plain pommade, 1 lb.; palm oil, $\frac{1}{2}$ oz.; melt, pour off the clear, and add oil of cassia and huile au jasmin, of each, 1 dr.; neroli, 20 drops; oil of verbena or lemon grass, 15 drops; otto of roses, 5 drops; and stir until nearly cold. Very fragrant.

Pommade d'Hebe. *Prep.* To white wax, 1 oz., melted by a gentle heat, add, of the juice of lily bulbs and Narbonne honey, each, 2 oz.; rose water, 2 drs.; otto of roses, 2 drops. Applied night and morning to remove wrinkles.

Pommade de Ninon de l'Enclos. *Prep.* Take of oil of almonds, 4 oz.; prepared lard, 3 oz.; juice of houseleek, 3 fl. oz. *Used* chiefly as a skin cosmetic. Said to be very softening and refreshing.

Pommade Divine. *Prep.* 1. Washed and purified beef marrow, 2 lbs.; liquid styrax, cypress wood, and powdered orris root, of each, 2 oz.; powdered cinnamon, 1 oz.; cloves and nutmegs, of each (bruised), $\frac{1}{2}$ oz.; digest the whole together by the heat of a water bath for six hours, and then strain through flannel.

2. Plain pommade, 2 lbs.; essence of lemon and bergamot, of each, 2 drs.; oils of lavender and origanum, of each, 1 dr.; oils of verbena, cassia, cloves, and neroli, of each, 12 drops;

huile au jasmin, 3 drs.; essence of violets, $\frac{1}{2}$ oz.

Pommade, Dupuytren's. *Prep.* 1. Take of prepared beef marrow, 12 oz.; melt, add of baume nerval (see page 852), 4 oz.; Peruvian balsam and oil of almonds, of each, 3 oz.; and, lastly, of alcoholic extract of cantharides, 36 grs.; (dissolve in) rectified spirit, 3 fl. drs. This is the original formula for this celebrated pommade. The following modifications of it are now commonly employed:—

2. (Cap.) Beef marrow, 2 oz.; alcoholic extract of cantharides, 8 grs.; rose oil, 1 dr.; essence of lemons, 30 drops.

3. (Guibourt.) Beef marrow and 'baume nerval' (page 852), of each, 1 oz.; rose oil, 1 dr.; alcoholic (or acetic) extract of cantharides, 6 grs.; (dissolved in) rectified spirit, q. s. These compounds are *used* to promote the growth of the hair and to prevent baldness, for which purpose they are usually coloured and scented according to the taste of the manufacturer. To be useful, they should be well rubbed on the scalp, at least once daily, for several weeks, and the head should be occasionally washed with soap-and-water.

Pommade, East India. *Prep.* Take of suet, 3 lbs.; lard, 2 lbs.; bees' wax (bright), $\frac{1}{2}$ lb.; palm oil, 2 oz.; powdered gum benzoin, 3 oz.; musk (previously triturated with a little lump sugar), 20 grs.; digest the whole together in a covered vessel, by the heat of a water bath, for 2 hours, then decant the clear portion, and add, of essence of lemon, $\frac{1}{2}$ oz.; oil of lavender, $\frac{1}{2}$ oz.; oils of cloves, cassia, and verberna, of each, $\frac{1}{2}$ dr. A favourite pommade in the East Indies.

Pommade, Hard. *Syn.* HARD POMATUM, ROLL P. *Prep.* 1. Take of beef suet, 2 lbs.; yellow wax, $\frac{1}{2}$ lb.; spermaceti, 1 oz.; powdered benzoin, $\frac{1}{2}$ oz.; melt them together, then add, of oil of lavender, 2 drs.; essence of ambergris, $\frac{1}{2}$ dr. Before it concretes pour it into moulds of paper or tin foil.

2. Mutton suet and lard, of each, 1 lb.; white wax, 6 oz.; melt, and add, of essence of lemon, 2 drs.; oil of cassia, $\frac{1}{2}$ dr. Other perfumes may be employed at will.

Hard pomatums are used to gloss and set the hair. They act both as 'pommade' and 'fixateur.' See COSMETIQUE.

Pommade, Macassar. *Prep.* From castor oil, 5 oz.; white wax, 1 oz.; alkanet root, $\frac{1}{2}$ dr.; heat them together until sufficiently coloured, then strain, and add, oil of origanum and oil of rosemary, of each, 1 dr.; oil of nutmeg, $\frac{1}{2}$ dr.; otto of roses, 10 drops. Said to be equal in efficacy to MACASSAR OIL.

Pommade, Marechal. Plain pommade scented by digesting it with *poudre marechal*.

Pommade, Marrow. *Syn.* MARROW POMATUM. *Prep.* From prepared beef marrow, $\frac{1}{2}$ lb.; beef suet, $\frac{1}{2}$ lb.; palm oil, $\frac{1}{2}$ oz.; melted together and scented at will.

Pommade, Millefleur. *Prep.* From plain pommade scented with a mixture of essence of

lemon and essence of ambergris, each, 4 parts; oil of lavender, 2 parts; oil of cloves and essence de petit grain, of each, 1 part; or with other like perfumes so proportioned to each other that no one shall predominate. Much esteemed.

Pommade, Roll. See **HARD POMMADE**.

Pommade, Roman. See *below*.

Pommade, Rose. *Syn.* **ROSE POMATUM**. This is plain pommade or hard lard, which has been well beaten with eau de rose, or, better still, scented with otto of roses. It is sometimes tinged with alkanet root.

Pommade, Soft. Plain pomatum scented at will.

Pommade, Soubeiran's. *Prep.* From beef marrow, $1\frac{1}{2}$ oz.; oil of almonds, $\frac{1}{2}$ oz.; disulphate of quinine, 1 dr. Recommended for strengthening and restoring the hair.

Pommade, Vanilla. *Syn.* **ROMAN POMMADE**, **POMMADE A LA VANILLE**, **POMMADE ROMAIN**. From plain pommade and pommade à la rose, of each, 12 lbs.; powdered vanilla, 1 lb.; heat them together in a water bath, stir constantly for 1 hour, let it settle for another hour, decant the clear, and add, oil à la rose, $2\frac{1}{2}$ lbs.; bergamot, 4 oz.

POPPY. *Syn.* **WHITE POPPY**; **PAPAVER SOMNIFERUM**, L. The capsules or fruit ("mature"—Ph. L.; "not quite ripe"—Ph. E.) form the poppies or poppy-heads of the shops (**PAPAVERIS CAPSULA**; **PAPAVER**—Ph. L. E. & D.). They are anodyne and narcotic, similar to opium, but in only a very slight degree. The seeds (**MAW SEED**), which are sweet, oleaginous, and nutritious, are used as a substitute for almonds in confectionery and mixtures, and are pressed for their oil. See **EXTRACT**, **OPIUM**, and **SYRUP**.

Poppy, Red. *Syn.* **CORN POPPY**, **CORN ROSE**; **PAPAVER RHCEAS**, L. The fresh petals or flowers (**RHCEADOS PETALA**; **RHCEAS**—Ph. L. E. & D.) are reputed pectoral, but are chiefly employed on account of their rich colour. See **SYRUP**.

POPULIN. *Syn.* **POPULINUM**, L. A peculiar neutral, crystallisable substance, formerly supposed to be an alkaloid, found, associated with **SALICIN**, in the root-bark of the *Populus tremula* (Linn.), or aspen.

Prep. Concentrate the decoction by a gentle heat, and set it aside in a cool situation to crystallise; dissolve the crystals which are deposited in rectified spirit, decolour them by digestion with animal charcoal, filter, and again crystallise. To render them still purer, they may be redissolved and crystallised a second and a third time, if necessary.

Prop., &c. It resembles salicin in appearance and solubility, but, unlike that substance, has a penetrating sweet taste. Dilute acids convert it into benzoic acid, grape sugar, and saliretin; and with a mixture of sulphuric acid and bichromate of potassa it yields a large quantity of salicylic acid. It appears to be tonic, stomachic, and febrifuge.

PORCELAIN. See **POTTERY**.

PORK. The value of pork as an article diet is well known. That from the young and properly fed animal is savoury, easy of digestion, and, when only occasionally employed highly wholesome; but it is apt to disagree with some stomachs, and should, in such cases, be avoided. To render it proper for food, should be thoroughly but not overcooked. When salted, it is less digestible. The frequent use of pork is said to favour obesity and to occasion disorders of the skin, especially in the sedentary.

PORPHYRIZED, PORPHORIZATIO.

Words coined by recent pharmaceutical writers and possessing similar meanings to **LEVIGATION** and **LEVIGATION**.

PORPHYROXIN. A neutral crystallisable substance discovered by Merck in opium. It is soluble in both alcohol and ether, insoluble in water, and is characterised by assuming purplish-red colour when heated in dilute hydrochloric acid.

PORRIGO. See **RING-WORM**.

PORTER. This well-known beverage, now the common drink of the inhabitants of London, by whom it is generally termed 'beer', originated with a brewer named Harwood, 1722. Previously to this date, 'ale', 'best', and 'twopenny', constituted the stock in trade of the London publican, and were drunk either singly or together, under the names 'half-and-half' or 'three threads,' for which the vendor was compelled to have recourse to two or three different casks, as the case might demand. The inconvenience and trouble thus incurred led Mr. Harwood to endeavour to produce a beer which should possess the flavour of the mixed liquors. In this he succeeded well that his new beverage rapidly superseded the mixtures then in use, and obtained general preference among the lower classes of the people. At first this liquor was called 'entire' or 'entire butt,' on account of being drawn from one cask only, but it afterwards acquired, at first in derision, the familiar name of 'porter,' in consequence of its general consumption among porters and labourers. The word 'entire' is still, however, frequently met with on the signboards of taverns about the metropolis.

The characteristics of pure and wholesome porter are its transparency, lively dark brown colour, and its peculiar bitter and slightly burnt taste. Originally, these qualities were derived from the 'high-dried malt,' with which alone it was brewed. It is now generally not entirely made from 'pale' or 'amber' malt mixed with a sufficient quantity of 'pale' or 'roasted malt' to impart the necessary flavour and colour. Formerly, this liquor 'vatted' and 'stored' for some time before being sent out to the retailer, but the change in the taste of the public during the latter quarter of a century in favour of the mild new porter has rendered this unnecessary.

best 'draught porter,' at the time of its consumption, is now only a few weeks old. In this state only would it be tolerated by the modern beer-drinker. The old and acid beverage that was formerly sold under the name of porter would be rejected at the present day, as 'hard' and unpleasant, even by the most thirsty votaries of malt liquor.

The 'beer' or 'porter' of the metropolitan brewers is essentially a weak mild ale, coloured and flavoured with roasted malt. Its richness in sugar and alcohol, on which its stimulating and nutritive properties depend, is hence less than that of an uncoloured mild ale brewed from a like original quantity of malt. For pale malt is assumed to yield 80 to 84 lbs. of saccharine per quarter; whereas the torrefied malt employed by the porter-brewers only yields 18 to 24 lbs. per quarter, and much of even this small quantity is altered in its properties, and is incapable of undergoing the vinous fermentation. In the manufacture of porter there is a waste of malt which does not occur in brewing ale; and the consumer must, therefore, either pay a higher price for it or be content with a weaker liquor.

The hygienic properties of porter, for the most part, resemble those of other malt liquors. Some members of the faculty conceive that it is better suited to persons with delicate stomachs and weak digestion than either ale or beer. That there may be some reason for this preference, in such cases, we are not prepared to deny, but undoubtedly, when the intention is to stimulate and nourish the system, ale is preferable. Certain it is, however, that the dark colour and strong taste of porter render its adulteration easier than that of ale, whilst such adulteration is more difficult of detection than in the paler varieties of malt liquors. "For medical purposes, 'bottled porter' (*CEREVISIA LAGENARIA*) is usually preferred to 'draught porter.' It is useful as a restorative in the latter stages of fever, and to support the powers of the system after surgical operations, severe accidents, &c." (Pereira, ii, 982.) When 'out of condition' or adulterated, porter, more than perhaps any other malt liquor, is totally unfit for use as a beverage, even for the healthy; and when taken by the invalid, the consequences must necessarily be serious. Dr. Ure says that pure porter, "when drank in moderation, is a far wholesomer beverage for the people than the thin acidulous wines of France and Germany."

The manufacture of porter has been described in our article on BREWING, and is also referred to above. It presents no difficulty or peculiarity, beyond the choice of the proper materials. A mixture of 'brown' and 'black malt' is thought to yield a finer flavour and colour to the pale malt that gives the body to the liquor than when 'black' or 'roasted malt' is employed alone. The proportion of the former to the latter commonly varies from 1-6th to 1-4th. When 'black malt' is alone used,

the proportion varies from the 1-10th to 1-15th. 1 lb. of 'roasted malt,' mashed with about 79 lbs. of pale malt, is said to be capable of imparting to the liquor the flavour and colour of porter. The following formulae were formerly commonly employed in London:—

1. (DRAUGHT PORTER.) From pale malt, $3\frac{1}{2}$ qrs.; amber malt, 3 qrs.; brown malt, $1\frac{1}{2}$ qr.; mash at twice with 28 and 24 barrels of water, boil with brown Kent hops, 56 lbs., and set with yeast, 40 lbs. *Prod.* 28 barrels, or $8\frac{1}{2}$ times the malt, besides 20 brls. of table-beer from a third mashing.

2. (BOTTLING PORTER; BROWN STOUT.) From pale malt, 2 qrs.; amber and brown malt, of each, $1\frac{1}{2}$ qr.; mash at 3 times with 12, 7, and 6 brls. of water, boil with hops, 50 lbs., and set with yeast, 26 lbs. *Prod.* 17 brls., or $1\frac{1}{2}$ times the malt.

The purity and quality of porter, as well as of other malt liquors, may be inferred in the manner noticed under BEER (see page 201); but can only be positively determined by a chemical examination. For this purpose several distinct operations are required:—

1. *Richness in ALCOHOL.* This may be correctly found by the method of M. Gay-Lussac; or, from the boiling-point. (See ALCOHOLOMETRY and EBUULLIOSCOPE.) The method with anhydrous carbonate of potassa (see *g. a.*, page 47) will also give results sufficiently near to the truth for ordinary purposes, when strong or old beer is operated on. The quantity of the liquor tested should be 3600 water-grains measure; and it should be well agitated, with free exposure to the air, after weighing it, but before testing it for its alcohol. The weight of alcohol found, multiplied by 1.8587, gives its equivalent in sugar. This may be converted into 'brewer's pounds' or density per barrel, as below.

2. *Richness in SACCHARINE or EXTRACTIVE MATTER.* A like quantity of the liquor under examination, after being boiled for some time to dissipate its alcohol, is made up with distilled water, so as to be again exactly equal to 3600 water-grains measure. The sp. gr. of the resulting liquid is then taken, and this is reduced to 'brewer's pounds' per barrel, by multiplying its excess of density above that of water (or 1000) by 360, and pointing off the three right-hand figures as decimals.

3. *ACETIC ACID or VINEGAR.* This is determined by any of the common methods of ACIDIMETRY (which see; see also ACETIMETRY). Each grain of anhydrous acetic acid so found represents 1.6765 gr. of sugar.

4. *Gravity of ORIGINAL WORT.* This is obtained by the addition of the respective quantities of saccharine matter found in Nos. 1, 2, and 3 (*above*). These results are always slightly under the true original density of the wort, as cane sugar appears to have been taken by the Excise as the basis of their calculations. More correctly, $12\frac{1}{2}$ of proof spirit is equivalent to 19 lbs. of saccharine per barrel. $10\frac{1}{2}$ lbs.

of saccharine are equiv. to 1 gall. of proof spirit.

5. *Detection of NARCOTICS.* This may be effected either by the method described under ALKALOID, or by one or other of the following processes:—

a. $\frac{1}{2}$ gall. of the beer under examination is evaporated to dryness in a water bath; the resulting extract is boiled for 30 or 40 minutes in a covered vessel with 10 or 12 fl. oz. of alcohol or strong rectified spirit, the mixture being occasionally stirred with a glass rod, to promote the action of the menstruum; the alcoholic solution is next filtered, treated with a sufficient quantity of solution of diacetate of lead to precipitate colouring matter, and again filtered; the filtrate is treated with a few drops of dilute sulphuric acid, again filtered, and then evaporated to dryness; it may then be tested with any of the usual reagents, either in the solid state or after being dissolved in distilled water. Or, the extract, obtained as above, may be boiled as directed with rectified spirit, the solution filtered, the spirit distilled off, and a small quantity of pure liquor of potassa added to the aqueous residue, which is then to be shaken up with about 1 fl. oz. of ether; lastly, the ethereal solution, which separates and floats on the surface, is decanted, evaporated, and the residuum tested, as before. The alkaline liquid, from which the ether has been decanted, is then separated from any precipitate which may have formed, and both of these separately tested for alkaloids.

b. From 2 to 3 oz. of purified animal charcoal are diffused through $\frac{1}{2}$ gall. of the beer, and is digested in it, with frequent agitation, for from 8 to 12 hours; the liquor is next filtered, and the charcoal collected on the filter is boiled with about $\frac{1}{2}$ pint of rectified spirit; the resulting alcoholic solution is then further treated as above, and tested. This answers well for the detection of strychnine or nuxvomica.

6. *PICRIC ACID.* This substance, which was formerly employed to impart bitterness to London porter in lieu of hops, may be detected as follows:—

a. A portion of the liquor agitated with a little solution of diacetate of lead loses its bitter flavour if it depends on hops, but retains it if it depends on picric acid.

b. Pure beer is decoloured and deodorised by animal charcoal; but beer containing picric acid, when thus treated, retains a lemon-yellow colour and the odour.

c. Unbleached sheep's wool, boiled for six or ten minutes, and then washed, takes a canary-yellow colour if picric acid be present. This test is so delicate that 1 gr. of the adulterant, in 150,000 grs. of beer is readily detected.

7. *MINERAL MATTER.*—a. A weighed quantity of pure beer evaporated to dryness, and then incinerated, does not furnish more than from 20% to 35% of ash, the quantity varying within these limits with the strength of the

liquor and the character of the water used in brewing it.

b. A solution of this ash, made by decocting with distilled water, should be only rendered slightly turbid by solutions of acetate of lead, bichloride of platinum, nitrate of baryta, nit of silver, oxalate of ammonia, and sulphure of hydrogen.

c. If the beer contained common salt, above solution will give a cloudy white precipitate with a solution of nitrate of silver. Each grain of this precipitate is equivalent to $\frac{1}{2}$ gr. of common salt (nearly).

d. If GREEN COPPERAS (sulphate of iron) be present, ferridcyanide of potassium gives a precipitate, and ferrocyanide of potassium a bluish-white one, turning dark blue in air; solution of chloride of barium gives a white precipitate, each grain of which, after being washed, dried, and ignited, represents 1.188 gr. of crystallised protosulphate of iron.

e. The ash, digested in water slightly acidulated with nitric acid, and then boiled, yields a solution which, when cold, gives a black precipitate with sulphuretted hydrogen, a white one with dilute sulphuric acid, and lead is present.

For further information connected with this subject, see ALCOHOLOMETRY, ALE, BREWING, MALT LIQUORS, &c.

PORT-FIRE. A paper tube, from 9 to 10 inches in length, filled with a slow burning composition of metal powder, nitre, and sulphur rammed moderately hard, by a similar process to that adopted for small rockets. It is in lieu of a touch-match, to fire guns, mortars, and pyrotechnical devices, &c.

PORTLAND CEMENT. A species of mortar formed by calcining a mixture of limestone and argillaceous earth, and grinding the calcined mass to powder, in which state it must be served from the air. It is characterised by absorbing a large quantity of water, and rapidly becoming solid, and, after a time, acquiring considerable hardness. See MORTAR and CEMENT.

POSOL'OGY. See Dose.

POSSET. *Syn.* POSSETUM, L. Milk curdled with wine or any other slightly acidulous liquor. It is usually sweetened with either sugar or treacle, and is taken hot.

Prep. From new milk, $\frac{1}{2}$ pint; sherry, 1 wine-glassful; treacle, 1 or 2 spoonfuls, or q. s.; heat them together in a clean saucepan until the milk coagulates. This is called 'treacle posset' or 'milk posset,' and, taken on retiring to rest, is highly esteemed in some parts of the country as a domestic remedy for colds. Lemon juice, strong old ale, or even vinegar, is occasionally substituted for wine, and powdered ginger and nutmeg added at will.

POTASH. The 'potash,' or 'potashe,' as it is called in commerce, is an impure carbonate of potassium, so named after the pots or vessels in which

was first made. The 'potash,' or 'potassa,' of the chemist, is the hydrate of potassium, a peculiar metal, which is more particularly referred to below. The word potash is vulgarly applied to the crude or commercial carbonate of potassium. See CARBONATE OF POTASSIUM, &c.

POTASSIUM. K. The metallic base of potash. It was discovered, in 1807, by Sir H. Davy, who obtained it by submitting moistened potassium hydrate, under a film of naphtha, to the action of a powerful voltaic current. It has since been procured by easier methods, of which the following, invented by Brunner, is the best.

Prep. An intimate mixture of carbonate of potassium and charcoal is prepared by calcining, in a covered iron pot, the crude tartar of commerce; when cold, it is rubbed to powder, mixed with 1-10th part of charcoal in small lumps, and quickly transferred into a retort of stout hammered iron; the latter may be one of the iron bottles in which quicksilver is imported, a short and somewhat wide iron tube having been fitted to the aperture; the retort, thus charged, is placed upon its side, in a furnace so constructed that the flame of a very strong fire, preferably fed with dry wood, may wrap round it, and maintain every part of it at a very high and uniform degree of heat. A copper receiver, divided in the centre by a diaphragm, is next connected to the iron pipe, and kept cool by the application of ice, whilst the receiver itself is partly filled with mineral naphtha, to preserve the newly formed potassium as it distils over. The arrangement of the apparatus being completed, the fire is gradually raised until the requisite temperature, which is that of full whiteness, is reached, when decomposition of the alkali by the charcoal commences, carbonic oxide gas is abundantly disengaged, and potassium distils over, and falls in large drops into the liquid. To render the product absolutely pure, it is redistilled in an iron or green-glass retort, into which some naphtha has been put, that its vapour may expel the air, and prevent the oxidation of the metal. The pieces of charcoal are introduced for the purpose of absorbing the melted carbonate of potassium, and preventing its separation from the finely divided carbonaceous matter. *Prod.* $3\frac{1}{2}$ to $4\frac{1}{2}$ of the weight of tartar acted on, 1 lb. yielded 280 grs.

Prop., &c. Pure potassium is a brilliant white metal, with a high lustre; at the common temperature of the air it is soft, and may be easily cut with a knife, but at 32° Fahr. it is brittle and crystalline; it melts completely at 136° Fahr., and in close vessels distils unaltered at a low red heat. Sp. gr. 865. Its most remarkable property is its affinity for oxygen, which is so great that it takes it from most other substances containing it. Exposed to the air, its surface is instantly tarnished, and quickly becomes covered with a crust of

oxide or hydrate. It inflames spontaneously when thrown on water, and burns with a beautiful purple or purple-red flame, yielding a pure alkaline solution. It can only be preserved in naphtha, rock oil, or some other fluid hydrocarbon.

The salts of potassium are all soluble in water, the tartrate, periodate, and fluosilicate being the least so; they are usually colourless, unless the acid be coloured, crystallise readily, and form numerous double compounds. They can be recognised as follows:—

Sulphuretted hydrogen, sulphide of ammonium, and carbonate of ammonium, do not affect them. A solution of tartaric acid, added, in excess, to moderately strong neutral or alkaline solutions of potassium salts, gives a quickly subsiding, gritty or crystalline, white precipitate, which is redissolved on heating the liquid, and again separates as it cools; and is also soluble in aqueous solutions containing free alkali, or free mineral acids. Platinic chloride produces, in neutral and acid solutions, a yellow crystalline precipitate. Alkaline solutions require to be first slightly acidulated with hydrochloric acid. The separation of the precipitate here, as well as that produced by tartaric acid, is promoted by violent agitation and friction against the sides of the vessel, and the delicacy of both is increased by the addition of some alcohol. When converted into carbonate by igniting with excess of carbonate of ammonium and alcohol, and treated with sulphuretted hydrogen solution and nitroprusside of sodium, gives a splendid violet colour, turning through red to green on standing.

Potassium salts give with sodium periodate and hydro-fluosilicic acid, white precipitates soluble in much water.

Heated in the inner flame of the blowpipe on platinum wire, they impart a violet coloration, masked, however, by a mere trace of sodium salts.

Potassium, Acetate of. $KC_2H_3O_2$. *Syn.* ACETATE OF POTASH, POTASSIC ACETATE; POTASSE ACETAS (B. P., Ph. L. E. D.). *Prep.* (Ph. L.) Acetic acid, 26 fl. oz.; distilled water, 12 fl. oz.; mix, and add, gradually, carbonate of potassium, 1 lb., or q. s. to saturate the acid; next, filter the solution, and evaporate it by the heat of a sand bath, gradually applied, until the salt is dried.

Prop., &c. Acetate of potassium, prepared as above, occurs in shining white masses, having a foliated soft texture, a slight but peculiar odour, and a warm sharp taste; it deliquesces in the air; dissolves in rather less than its own weight of water, and in about twice its weight of alcohol; and by exposure to a red heat is converted into pure carbonate of potassium. In trade it is preserved in well-corked and sealed bottles.

Pur. It is entirely soluble in water, and in rectified spirit. These solutions neither

affect litmus nor turmeric, nor are they disturbed by either chloride of barium or nitrate of silver; but if from a stronger solution anything is thrown down by nitrate of silver, the same is again dissolved on the addition of water or dilute nitric acid. Sulphuric acid being added, the vapour of acetic acid is evolved. 100 grs. of this salt, digested in sulphuric acid, the solution evaporated, and the residuum dried at a high temperature, furnish 88.8 grs. of sulphate of potassium.

Uses, &c. Acetate of potassium has been found useful in dropsies, febrile affections, jaundice, scurvy, calculus, and several chronic skin diseases. During its exhibition the urine becomes at first neutral, and then alkaline, owing to the salt being converted into carbonate of potassium in the system.—*Dose.* As a diaphoretic and antiscorbutic, 15 to 20 grs.; as a diuretic, 20 to 60 grs.; as an aperient, 2 to 3 drs.; in each case dissolved in some bland liquid, or in the infusion of some mild vegetable bitter.

Potassium, Arseniate of. KH_2AsO_4 . *Syn.* ARSENIATE OF POTASSA, MONOPOTASSIC ARSENIATE, POTASSIUM DYHYDRIC ARSENIATE; POTASSÆ BINAERSENIAS, L. *Prep.* Take of arsenious acid (white arsenic) and nitrate of potassium, of each, in powder, 1 part; heat the mixture to dull redness in a glass flask, until it fuses and red vapours cease to be evolved; dissolve the residuum, when cold, in boiling distilled water, 50 parts; concentrate the solution by evaporation, and set it aside to crystallise.

Prop., &c. This salt forms large crystals, which are permanent in dry air, soluble in about $4\frac{1}{2}$ parts of water, and insoluble in alcohol. It is reputed tonic, alterative, and antipeccodice.—*Dose.* $\frac{1}{10}$ to $\frac{1}{2}$ gr., dissolved in sweetened water. It is also used to form a resist-paste in calico-printing, and in the manufacture of cobalt-blue.

Potassium, Borate of. $\text{K}_2\text{B}_4\text{O}_7$. *Syn.* POTASSÆ BORAS, L. *Prep.* From dry carbonate of potassium and dry boracic acid, equal parts, reduced to powder, and heated to redness in a covered crucible; the sublimed mass, when cold, being dissolved in boiling water, and the filtered solution concentrated by evaporation, and then set aside to crystallise; or at once completely evaporated to dryness.—*Dose.* 1 to 6 grs.; in calculi, &c.

Potassium, Borotartarate of. *Syn.* POTASSÆ BOROTARTRAS, CREMOR TARTARI SOLUBILIS, L.; CRÈME DE TARTRE SOLUBLE, Fr. *Prep.* (P. Cod.) Crystallised boracic acid, 1 part; bitartrate of potassium, 4 parts; water, 24 parts; dissolve by the aid of heat, in a silver basin, and, constantly stirring, evaporate the resulting solution, either to dryness, and then powder it, or merely to a syrupy consistence, when it may be spread upon plates, and dried in scales, by the heat of a stove. It must afterwards be preserved from the air.

Prop., &c. A white, deliquescent powder,

freely soluble in water. It has been used as solvent for lithic calculi, and in gout, &c.—*Dose.* 15 to 30 grs. In doses of 2 to 3 drs. it is laxative, and is very popular as such on the Continent.

Potassium, Bromide of. KBr . *Syn.* POTASS BROMIDUM (B. P.). *Prep.* Exactly as the iodide, which it resembles in its character only being somewhat less soluble in water or more in alcohol. Employed in similar cases and given in similar doses to the iodide.

Potassium, Carbonate of. K_2CO_3 . *Syn.* CARBONATE OF POTASSA, SUBCARBONATE OF POTASSA, SALT OF TARTAR; POTASSÆ CARBONAS (B. P., Ph. L. E. D.). Impure or crude carbonate of potassium is chiefly imported from America and Russia, and is obtained by lixiviating wood ashes, and evaporating the solution to dryness. The mass is then transferred into iron pots, and is kept in a state of fusion for several hours, until it becomes quiescent when the heat is withdrawn, and the whole left to cool. It is next broken up and packed in air-tight barrels, and in this state constitutes the 'potashes' or 'potash' of commerce. Another method is to transfer the black salts, or product of the first evaporation from the kettles to a large oven or furnace, constructed that the flame is made to play over the alkaline mass, which is kept constantly stirred by means of an iron rod. The ignition is continued until the impurities are burned out, and the mass changes from blackish tint to a dirty or bluish white. The whole is next allowed to cool, and is then broken into fragments, and packed in casks before. It now constitutes 'pearlash.'

When pearlash is dissolved in cold distilled water, the solution depurated, filtered, and crystallised, or simply evaporated to dryness, forms 'refined ashes,' or carbonate of potassium sufficiently pure for most pharmaceutical or technical purposes. The granulated carbonate of potash, salt of tartar, or prepared kali, the shops, is simply refined ashes while during the evaporation, and more especially towards the conclusion of the desiccation, has been assiduously stirred, so that it may form small white granulations, instead of adhering together to form an amorphous solid mass. In this state it constitutes the ordinary or carbonate of potassa of the Pharmacopœias. Ordinary potash or pearlash may be refined as follows:—Raw potash, 10 parts, is dissolved in cold water, 6 parts, and the solution is allowed to remain for 24 hours, in a cool place; it is then filtered, and somewhat concentrated by evaporation, crystallisation being prevented by continually stirring the mass until the whole is nearly cold; it is next decanted into a strainer and the mother-liquor allowed to drip off; the residuum is evaporated to dryness at a gentle heat, and redissolved in cold distilled water; the new solution, after filtration, is again evaporated to dryness. The product is quite free from potassium sulphate.

and is nearly free from both potassium chloride and silicates.

Potassium, Pure Carbonate of. CARBONATE OF POTASSA (POTASSÆ CARBONAS PURUM—Ph. E. & D., and Ph. L., 1836).—(Ph. L., 1836.) From bicarbonate of potassium, in crystals, heated to redness in a crucible.

(Ph. E.) As the last. Or, more cheaply, by dissolving bitartrate of potassium in thirty parts of boiling water, separating and washing the crystals which form on cooling, heating them in a loosely covered crucible to redness as long as fumes are discharged, breaking down the mass, and roasting it in an oven for two hours, with occasional stirring; lixiviating the product with (cold) distilled water, filtering the solution thus obtained, evaporating it to dryness, granulating the salt towards the close by brisk agitation, and, lastly, heating the granular salt thus obtained nearly to redness.

(Ph. D.) Bitartrate of potassium, 2 lbs., is exposed to a red heat in an iron crucible, as before; the powdered calcined mass is boiled for 20 minutes in water, 1 quart, the solution filtered, and the filter washed with water, 1 pint, to which ammonium sesquicarbonate, $\frac{1}{2}$ oz., has been added; the mixed and filtered liquors are evaporated to dryness, and, a low red heat having been applied, the residuum is rapidly reduced to powder in a warm mortar, and at once enclosed in (dry and) well-stopped bottles.

Prop. These are well-known. It exhibits most of the properties of hydrate of potassium, but in a vastly less degree. It is very deliquescent, effervesces with acids, exhibits a marked alkaline reaction with test paper, is insoluble in alcohol, but dissolves in less than its own weight of water, its affinity for the last being so great that it takes it from alcoholic mixtures.

Pur. &c. Carbonate of potassium frequently contains an undue quantity of water, as well as silicic acid, sulphates, and chlorides. The water may be detected by the loss of weight the salt suffers when heated; the silica, by adding to it hydrochloric acid in excess, evaporating to dryness, and igniting the residuum, by which this contamination is rendered insoluble; the sulphates and chlorides may be detected by adding nitric acid in excess, and testing the liquid with nitrate of silver and chloride of barium. If the former produces a white precipitate, a chloride is present; and if the latter does the same, the contamination is sulphate. Carbonate of potassium deliquesces in the air, and is almost entirely dissolved by water; in an open vessel it spontaneously liquefies. It changes the colour of turmeric brown. Supersaturated with nitric acid, neither carbonate of sodium nor chloride of barium throws down anything, and nitrate of silver very little.

which is so great that it loses 26.3 grs. of water by a strong red heat. Carbonate anhydride when placed in contact with dilute sulphuric acid.

Potassium, Bicarbonate of. KHCO_3 . *Syn.* POTASSIUM HYDROGEN CARBONATE, BICARBONATE OF POTASSA; POTASSÆ BICARBONAS (B.P., Ph. L. E. & D.). *Prep.* 1. (Ph. L. 1836.) Carbonate of potassium, 6 lbs.; distilled water, 1 gall.; dissolve, and pass carbonic anhydride (from chalk and sulphuric acid diluted with water) through the solution to saturation; apply a gentle heat, so that whatever crystals have been formed may be dissolved, and set aside the solution, that crystals may again form; lastly, the liquid being poured off, dry them.

2. (Ph. D.) Carbonic anhydride, obtained by the action of dilute hydrochloric acid on chalk (the latter contained in a perforated bottle immersed in a vessel containing the acid), is passed, by means of glass tubes connected by vulcanised India rubber, to the bottom of a bottle containing a solution of carbonate of potassium, 1 part, in water, $2\frac{1}{2}$ parts; as soon as the air is expelled from the apparatus the corks through which the tubes pass are rendered air-tight, and the process left to itself for a week; the crystals thus obtained are then shaken with twice their bulk of cold water, drained, and dried on bibulous paper, by simple exposure to the air. From the mother-liquor, filtered, and concentrated to one half, at a heat not exceeding 110° Fahr., more crystals may be obtained. The tube immersed in the solution of carbonate of potassium will have to be occasionally cleared of the crystals with which it is liable to become choked, else the process will be suspended.

3. (Apothecaries' Hall, London.) Potassium carbonate, 100 lbs.; distilled water, 17 galls.; dissolve, and saturate the solution with carbonic anhydride, as in No. 1, when 35 to 40 lbs. of crystals of bicarbonate of potassium may be obtained; next dissolve carbonate of potassium, 50 lbs., in the mother-liquor, and add enough water to make the whole a second time equal to 17 galls.; the remaining part of the operation is then to be performed as before. This plan may be repeated again and again, for some time, provided the carbonate used is sufficiently pure.

4. (Ph. E.) Take of carbonate of potassium, 6 oz.; sesquicarbonate of ammonium, $\frac{3}{4}$ oz.; triturate them together, and, when reduced to a very fine powder and perfectly mixed, make them into a stiff paste with a very little water; dry this, very carefully, at a heat not higher than 140° Fahr., until a fine powder, perfectly devoid of ammoniacal odour, be obtained, occasionally triturating the mass towards the end of the process.

5. (Commercial.) From carbonate of potassium, in powder, made into a paste with water, and exposed for some time on shallow trays, in a chamber filled with an atmosphere of carbonic anhydride, generated by the combustion of either coke or charcoal, and purified by being forced through a cistern of cold water; the resulting salt is next dissolved in the least pos-

sible quantity of water at the temperature of 120° Fahr., and the solution filtered and crystallised.

Prop. It is soluble in 4 times its weight of water at 60° Fahr.; is fixed in the air, but loses carbonic acid below the temperature of a carbonate at a red heat. It possesses the general alkaline properties of carbonate of potassium, but in an inferior degree, having only a slightly alkaline taste, and, when absolutely pure, not affecting the colour of turmeric.

Par. In a solution of pure bicarbonate of potassium, a solution of mercuric chloride merely causes an opalescence, or very slight white precipitate; if it contains carbonate, a brick-coloured precipitate is thrown down. From 100 grs. of the pure crystals of bicarbonate, 30·7 grs. of water and carbonic acid are expelled at a red heat. In other respects it may be tested like the carbonate.

Uses, &c. Bicarbonate of potassium is the most agreeable of all the salts of potassium, and is much used as an antacid or absorbent, and for making effervescing saline draughts. It has also been successfully employed in rheumatism, scurvy, gout, dyspepsia, and various other diseases in which the use of potassium is indicated. The *dose* is from 10 grs. to ʒ dr.

20 grs. bicarbonate, in crystals,

are equivalent to

14 grs. of crystallised nitric acid,
15 grs. " tartaric acid, and
½ oz. of lemon juice.

Potassium, Chlorate of, KClO_3 . *Syn.*

CHLORATE OF POTASH; POTASSÆ. CHLORAS (B. P., Ph. L. & D.). *L. Prep.* 1. Chlorine gas is conducted by a wide tube into a moderately strong and warm solution of hydrate or carbonate of potassium, until the absorption of the gas ceases, and the alkali is completely neutralised; the liquid is then kept at the boiling temperature for a few minutes, after which it is gently evaporated (if necessary) until a pellicle forms on the surface, and is next set aside, so as to cool very slowly; the crystals, thus obtained, are drained and carefully washed on a filter, with ice-cold water, and are purified by re-solution and recrystallisation. The product is chlorate of potassium. The mother-liquor, which contains much chloride of potassium mixed with some chlorate, is either evaporated for more crystals (which are, however, less pure than the first crop) or is preserved for a future operation.

Obs. The product of the above process is small, varying from 10 to 45% of the weight of the potassium consumed in it, according to the skill with which it is conducted; this apparent loss of potassium arises from a large portion of it being converted into chloride, a salt of comparatively little value. The following processes have been devised principally with the

view of preventing this waste, or of employing a cheaper salt of potassium than the carbonate:—

2. A solution of chloride of lime is precipitated with a solution of carbonate of potassium, and the liquid, after filtration, saturated with chlorine gas; it is then evaporated and tallised as before. Dr. Ure has suggested substitution of sulphate of potassium for carbonate, by which the process would be rendered very inexpensive.

3. Carbonate of potassium, 69 parts of the or 82 parts of the granulated; hydrate of calcium, 37 parts (dry fresh slaked lime); bo powder; are mixed together, and exposed to action of chlorine gas, to saturation; (this is absorbed with great rapidity, the temperature rises above 212° Fahr., and water is evolved); the heat, with free exposure, is maintained at 212° for a few minutes, to remove some trace of 'hypochlorite', the dunn, consisting of chlorate of potassium chloride of calcium, is treated with hot water, the chlorate of potassium crystallised out, resulting solution, as before. This process, which is an excellent one (the loss of potassium being for the most part avoided), has been modified and improved by various authors, as will be seen below.

4. A solution of chloride of lime (18 Baumé) is heated in a leaden or cast-iron vessel, and sufficient of a salt of potassium added to raise the density of the liquid 3 or 4 hydrot degrees; the solution is then quickly, but fully, concentrated until the gravity rises to 31° Baumé, when it is set aside to crystallise. A good and economical process.

5. Chloride of potassium, 76 parts, and calcium hydrate, 222 parts, are reduced to a thin paste with water, q. s., and a stream of chlorine gas passed through the mixture to saturation; chloride of calcium and chloride of potassium are formed; the last is then removed by solution in boiling water, and is crystallised as before. This process, which has received the approval and recommendation of L. has long been practised in Germany, and was originally introduced to this country by Wagenmann. The product is very large and of excellent quality.

Prop. White, inodorous, four- or six-pearly scales, soluble in about 20 parts of water and 2½ parts of boiling water; in taste resembles nitre, but is somewhat more astringent at about 450° Fahr. it undergoes the ignition, and on increasing the heat almost redness effervescence ensues, and fully pure oxygen gas is given off, whilst the residue becomes changed into chloride of potassium. When mixed with inflammable substances, triturated, heated, or subjected to a smart or strong pressure, or moistened with a strong acid, it explodes with great violence.

Par., tests, &c. The usual impurity of potassium salt is chloride of potassium, arising from less or imperfect manipulation.

present, a solution of nitrate of silver gives a curdy white precipitate, soluble in ammonia; whereas a solution of the pure chlorate remains clear.

Uses. Chlorate of potassium is principally used in the manufacture of lucifer matches, fireworks, oxygen gas, &c., and as an oxidising agent in calico printing. It was formerly used to fill percussion caps, but was abandoned for fulminating mercury, on account of its disposition to rust the nipples of the guns. As a medicine, it is stimulant and diuretic. It has been given in dropsy, syphilis, scurvy, cholera, typhus, and other depressing affections. It gives a fine artificial colour to the blood. (Stevens).—*Dose.* 5 to 15 grs., in solution, twice or thrice a day.

Concluding remarks. Formerly, chlorate of potassium was a salt which was made only on the small scale, and chiefly used in experimental chemistry; now it is in considerable demand, and forms an important article of chemical manufacture. The latter has hence, of late years, received considerable attention and improvement in the leading laboratories of Europe. The chlorate requires to be handled with great care. It should never be kept in admixture with any inflammable substance, more especially with sulphur, phosphorus, or the sulphides, as these compounds are exploded by the most trivial causes, and, not unfrequently, explode spontaneously.

Potassium, Chloride of. *KCl.* *Syn.* CHLORIDE OF POTASSA. *Prep.* The chloride of potassium of commerce is usually a secondary product in the manufacture of chlorate of potassium and other substances. The mother-liquor of the former is evaporated to dryness and heated to dull redness, the calcined mass is then dissolved in water, the solution purified by defecation and evaporated down for crystals.

It can also be well prepared by neutralising boiling solution of carbonate of potassium by dilute hydrochloric acid, evaporating down, and crystallising.

Prop., &c. It closely resembles culinary salt in appearance; is anhydrous; dissolves in about 4 parts of cold and 2 of boiling water; has a slightly bitter, saline taste; fuses at a red heat; and is volatilised at a very high temperature. As a medicine, it is diuretic and aperient. It was formerly in high repute as a resolvent and antiscorbutic, and, particularly, as a remedy for intermittents. It is now seldom used.—*Dose.* 10 grs. to $\frac{1}{2}$ dr., or more.

Potassium, Chromate of. *K₂CrO₄.* *Syn.* CHROMATE OF POTASSA, NEUTRAL CHROMATE OF P., MONOCHROMATE OF P., YELLOW C. OF P., SALT OF CHROME; POTASSÆ CHROMAS, P. C. FLAVA, L. This salt is only prepared on the large scale. Its source is 'CHROME ORE,' a natural octahedral chromate of iron, found in various parts of Europe and America. For medicinal purposes the commercial chromate is purified by solution in hot water, filtration, and recrystallisation.

Prep. 1. The ore, previously assayed to determine its richness, and freed as much as possible from its gangue, is ground to powder in a mill, and mixed with a quantity of coarsely powdered nitre rather less than that of the oxide of chromium which it contains; this mixture is exposed, for several hours, to a powerful heat on the hearth of a reverberatory furnace, during which time it is frequently stirred up with iron rods; the calcined mass is next raked out and lixiviated with hot water, and the resulting yellow-coloured solution evaporated briskly over a naked fire, or by the heat of high-pressure steam; chromate of potassium falls, under the form of a granular yellow salt, which is removed from time to time with a ladle, and thrown into a wooden vessel, furnished with a bottom full of holes (draining box), where it is left to drain and dry. In this state it forms the chromate of potassium of commerce. By a second solution and recrystallisation, it may be obtained in large and regular crystals. The next process has for its object the employment of a cheaper salt of potassa than the nitrate.

2. (Swindell & Co., *Patent* dated Nov., 1850.) A mixture of pulverised chrome ore and chloride of potassium is exposed to a full red heat, on the hearth of a reverberatory furnace, with occasional stirring for some time, when steam at a very elevated temperature is made to act on it, until the conversion is complete, known by assaying a portion of the mass; the chromate is then dissolved out of the residuum, as before. Common salt or hydrate of calcium may be substituted for chloride of potassium, when the chromates of sodium or calcium are respectively produced.

3. On the small scale, this salt may be prepared from the bichromate by neutralising it with hydrate of potassium.

Prop. Yellow; tastes cool, bitter, and disagreeable; soluble in 2 parts of water at 60° Fahr.; the crystals are efflorescent.

Pur. The salt of commerce is frequently contaminated with large quantities of sulphate or chlorate of potassium. To detect these, M. Zuber adds tartaric acid, dissolved in 50 parts of water, to a like solution of the sample. As soon as the decomposition is complete, and the colour verges towards the green, the supernatant liquor should afford no precipitate with solutions of the nitrates of silver and barium, whence the absence of chlorides and sulphates may be respectively inferred. The proportions are, 8 parts of tartaric acid to 1 part of the chromate. If saltpetre is the adulterating ingredient, the sample deflagrates when thrown upon burning coals.

Assay. 1. A solution of 50 grs. of the salt is treated with a solution of nitrate of barium, the precipitate digested in nitric acid, and the insoluble portion (sulphate of barium) washed, dried, and weighed. 117 grs. of this substance are equivalent to 89 grs. of sulphate of potassium.

2. The nitric solution, with the washings (see *above*), is treated with a solution of nitrate of silver, and the precipitate of chloride carefully collected, washed, dried, ignited, and weighed. 144 grs. of chloride of silver represent 76 grs. of chloride of potassium.

3. The nitric solution, with the washing (see *above*), after having any remaining barium thrown down by adding dilute sulphuric acid, in slight excess, is treated with ammonia, and the resulting precipitate of chromic oxide collected on a filter, washed, dried, carefully ignited in a silver, platinum, or porcelain crucible; and weighed. 40 grs. of this oxide represent 100 grs. of pure chromate of potassium. Any deficiency consists of impurities or adulterants.

Uses. Chromate of potassium is used in dyeing, bleaching, the manufacture of chromic acid, bichromate of potassium, &c. It is the common source of nearly all the other compounds of chromium. It is reputed alterative in doses of $\frac{1}{2}$ to $\frac{1}{4}$ gr.; and is emetic in doses of 1 to 4 grs. A solution in 8 parts of water is occasionally used to destroy fungus; 1 in 30 to 40 parts of water is also used as an antiseptic and desiccant.

Concluding remarks. The first process is undoubtedly the best, when expense is not an object. To reduce this, a mixture of 'potash' or 'pearlash,' with about $\frac{1}{2}$ of its weight of nitre, or 1-5th part of its weight of peroxide of manganese, may be substituted without much inconvenience. The assay of the chrome ore, alluded to above, may be made by reducing 100 grs. of it to powder, mixing it with twice its weight of powdered nitre, and a little hydrate of calcium, and subjecting the mixture to a strong red heat for 3 or 4 hours; the calcined mass may then be exhausted with boiling water, and the resulting solution, after precipitation with dilute sulphuric acid, in slight excess, and filtration, may be treated with rectified spirit, when its chromium may be thrown down by the addition of ammonia. (See *above*.) In the conversion of chrome ore into chromate of potassium, care should, in all cases, be taken that the proportion of nitre or alkali should be slightly less than what is absolutely required to saturate the ore, as the production of a neutral salt is thereby ensured; for should not the whole of the chromate be decomposed by the first calcination, it may easily be roasted a second time with fresh alkali, should the remaining quantity be thought worth the trouble. The nature of the furnace to be employed in the conversion is not of any great importance, so long as carbonaceous matters, from the fire are entirely excluded, and the required temperature is attainable.

Potassium, Bichromate of. $K_2Cr_2O_7$, or K_2CrO_4, CrO_3 . *Syn.* BICHROMATE OF POTASSA, RED CHROMATE OF POTASH, ACID C. OF P.; POTASSE BICHROMAS, L. *Prep.* 1. To a concentrated solution of yellow chromate of potassium, sulphuric acid, or, better, acetic acid,

is added in quantity equal to one half that required for the entire decomposition of the salt; the liquid is then concentrated by evaporation, and slowly cooled, so that crystals may form.

2. (Jacquelin.) Chrome ore, finely ground and sifted, is mixed with chalk; the mixture is spread on a thin layer on the hearth of a reverberatory furnace, and heated to bright redness, with repeated stirring, for 9 or 10 hours. The yellowish-green product consists essentially of neutral chromate of calcium, mixed with ferric oxide. It is ground and stirred up with hot water, and sulphuric acid is added till a slight acid reaction becomes apparent, a sign that the neutral chromate has been converted into bichromate. Chalk is now stirred in to precipitate the ferric sulphate, and after a while the clear solution is run off into another vessel, where it is treated with carbonate of potassium, which precipitates the lime and leaves bichromate of potassium in solution. The solution is then evaporated to the crystallising-point. This process, when carried out on a large scale, is very economical.

Prop., &c. It forms very beautiful square tables, or flat four-sided prismatic crystals; permanent in the air; soluble in 10 parts of water at 60°, and in less than 3 parts at 212° Fahr.; it has a metallic, bitter taste, and is poisonous. It is chiefly used in dyeing and bleaching, and as a source of chromic acid. The tests, &c., are the same as for the yellow chromate.

Potassium, Citrate of. $K_3C_6H_5O_7$. *Syn.* POTASSE CITRAS, L. *Prep.* From a solution of citric acid neutralised with carbonate of potassium, evaporated, and granulated, or crystallised; very deliquescent. Or, extemporaneously, in the form of solution, by adding carbonate or bicarbonate of potassium to lemon juice, as in the common effervescing draught.

Potassium, Cyanate of. $KCyO$, or $KCNO$. *Prep.* 1. By roasting, at a red heat, dry ferrocyanide of potassium, in fine powder, upon an iron plate, constantly stirring it until it becomes fused into one mass, which must be reduced to fine powder, and digested in boiling alcohol, from which crystals of the cyanate will be deposited as the solution cools.

2. (Liebig.) A mixture of ferrocyanide of potassium, with half its weight of peroxide of manganese, may also be used to produce this salt, as the last; the compound should be kindled by a red-hot body, and allowed to smoulder away, after which it may be treated with alcohol, as before.

3. A mixture of ferrocyanide of potassium and litharge is heated as before, and dissolved out by alcohol, and crystallised.

Prop. Crystallisable colourless or white salt, readily soluble in alcohol and water, but readily decomposed when moist into bicarbonate of potassium and ammonia, or in solution into the carbonate of potassium and ammonium.

This salt is poisonous. The cyanates of silver, lead, and many other metals, may be made by adding a solution of cyanate of potassium to another of a neutral salt of the base.

Potassium, Cyanide of. KCN, or KCy.
Syn. CYANIDE OF POTASH, CYANURET OF POTASSIUM; POTASSII CYANIDUM, P. CYANURETUM, L.

Prep. 1. (MEDICINAL CYANIDE OF POTASSIUM.)—*a.* A solution of pure hydrate of potassium, 2 parts, in highly rectified spirit, 7 parts, is placed in a receiver furnished with a safety tube, and surrounded with bruised ice; the beak of a tubulated retort containing ferrocyanide of potassium, in powder, 4 parts, is then adapted to it in such a manner that any gas or vapour evolved in the retort must traverse the solution in the receiver; the arrangement being complete, sulphuric acid, 3 parts, diluted with an equal weight of water, and allowed to cool, is cautiously poured into the retort, and the distillation conducted very slowly, a very gentle heat only being applied, as circumstances may direct; as soon as the force of ebullition in the retort has subsided, the distillation is complete, and the connection between the retort and receiver is broken; the contents of the receiver, now transformed into a mixture of a crystalline precipitate of cyanide of potassium, and an alcoholic solution of undecomposed hydrate of potassium, is carefully thrown on a filter, and the precipitate, after the mother-liquor has drained off, very cautiously washed with ice-cold and highly rectified spirit, and then drained, pressed, and dried on the same filter. The product is chemically pure, and equal to fully 10% of the ferrocyanide employed. This is a modification of what is commonly known as 'Wigger's process.'

b. Expose well-dried and powdered ferrocyanide of potassium to a moderate red heat, in a close vessel; when cold, powder the fused mass, place it in a funnel, moisten it with a little alcohol, and wash it with cold water; evaporate the solution thus formed to dryness, expose it to a dull red heat in a porcelain dish, cool, powder, and digest it in boiling rectified spirit; as the spirit cools, crystals of cyanide of potassium, nearly pure, will be deposited. The alcohol employed in both this and the preceding process may be recovered by distillation from calcined sulphate of iron.

2. (CRUDE or COMMERCIAL CYANIDE—Liebig.) Commercial ferrocyanide of potassium, 8 parts, rendered anhydrous by gently heating it on an iron plate, is intimately mixed with dry carbonate of potassium, 3 parts; this mixture is thrown into a red-hot earthen crucible, and kept in a state of fusion, with occasional stirring, until gas ceases to be evolved, and the fluid portion of the mass becomes colourless; the crucible is then left at rest for a few minutes, to allow its contents to settle, after which the clear portion is poured from the heavy black sediment at the bottom, upon a

clean marble slab, and the mass, whilst yet warm, broken up, and placed in well-closed bottles.

Obs. A cheap and excellent process. The product is said to contain about 1-8th part of cyanate of potassium, and, though not sufficiently pure for employment in medicine as potassium cyanide, is admirably adapted for the various technical applications of this substance, as in electro-plating, electro-gilding, photography, &c. It may also be advantageously substituted for the ferrocyanide in the preparation of hydrocyanic acid by the distillation of that substance along with dilute sulphuric acid.

Prop., &c. When pure, this salt is colourless and odourless; it forms cubic or octahedral crystals, which are anhydrous; it is freely soluble in water and in boiling alcohol, but most of it separates from the latter as the solution cools; it is fusible; and undergoes no change, even at a full red heat, in close vessels; it exhibits an alkaline reaction; when exposed to the atmosphere, it absorbs moisture, and acquires the smell of hydrocyanic acid. If it effervesces with acids, it contains carbonate of potassium, and if it be yellow it contains iron. It is employed in chemical analyses, and for the preparation of hydrocyanic acid; cyanide of sodium may be made in the same way. The dose is $\frac{1}{15}$ to $\frac{1}{4}$ gr., in solution; in the usual cases in which the administration of hydrocyanic acid is indicated.

Potassium, Ferricyanide of. K_3FeCy_6 , or $K_3FeC_6N_6$. *Syn.* FERRICYANIDE OF POTASSIUM, FERRICYANURET OF P., RED PRUSSIAN OF POTASH; POTASSII FERRICYANIDUM, P. PRUSSIAS RUBRUM, L. This important and beautiful salt was discovered by L. Gmelin. At first it was merely regarded as a chemical curiosity, but it is now extensively employed in dyeing, calico-printing, assaying, &c.

Prep. 1. Chlorine gas, prepared in the ordinary manner, is slowly passed into a cold solution of ferrocyanide of potassium, 1 part, in water, 10 parts, with constant agitation, until the liquid appears of a deep reddish-green colour, or of a fine red colour by transmitted light, and ceases to give a blue precipitate, or even a blue tinge, to a solution of ferric chloride, an excess of chlorine being carefully avoided; the liquor is next evaporated by the heat of steam or boiling water, until a pellicle forms upon the surface, when it is filtered, and set aside to cool; the crystals are afterwards purified by re-solution and re-crystallisation.—Another method is simply to evaporate the original solution to dryness, by a steam-heat, with agitation, then to redissolve the residuum in the least possible quantity of boiling water, and, after defecation or filtration, to allow the new solution to cool very slowly, that crystals may form.

2. (Extemporaneous.) Add nitric acid, very gradually, to a cold solution of ferrocyanide of potassium, with constant agitation, until a drop

the mixture ceases to impart a blue colour; a solution of ferric chloride, carefully avoiding excess of acid. It may be at once used in solution, or evaporated, &c., as before.

Prop., &c. Magnificent regular prismatic, sometimes, tabular crystals, of a rich ruby-red tint; permanent in the air; combustible; decomposed by a high temperature; soluble in 4 parts of cold water; insoluble in alcohol. Colours ferric salts a pale brown, gives with various salts a deep blue, and precipitates bismuth salts pale yellow; cadmium and mercuric salts, yellow; zinc salts, deep yellow; mercurous, cupric, molybdenic, silver, and uranic salts, reddish brown; cobalt salts, dark brown; manganous salts, brown; cupric salts, greenish; and nickelous salts, olive brown.

Potassium, Ferrocyanide of. K_4FeC_6 , or $K_4FeC_6N_6$. *Syn.* FERROCYANURET OF POTASSIUM, PRUSSIAN OF POTASH, YELLOW P. OF P.; POTASSÆ PRUSSIA FLAVA (B. P.), POTASSII FERROCYANIDUM (Ph. L. E. & D.), L. This valuable salt, the well-known 'prussiate of potash' of commerce, was discovered by the illustrious Scheele about the middle of the 18th century. It is now only manufactured on the large scale.

Prep. Good 'potash' or 'pearlash,' 2 parts, and dried blood, horns, hoofs, woollen rags, or other refuse animal matter, 5 or 6 parts, are reduced to coarse powder, and mixed with some coarse iron borings; the mixture is then injected into egg-shaped cast-iron pots in a state of moderate ignition; the mass is frequently stirred with an iron spatula, so as to prevent it running together, and the calcination is continued until fetid vapours cease to be evolved, and flame is no longer seen on stirring the mixture, care being taken to exclude the air from the vessels as much as possible; during the latter part of the process the pots are kept constantly covered, and the ignited mass stirred less frequently; the hot pasty mass is then removed with an iron ladle, and excluded from the air until cold; it is next exhausted by edulcoration with boiling water, and the resulting solution, after defecation or filtration, is concentrated by evaporation, so that crystals may form as the liquid cools; these are redissolved in hot water, and the solution allowed to cool very slowly, when large and beautiful yellow crystals of ferrocyanide of potassium are deposited.—*Product.* 1 oz. of dried blood or woollen refuse, with 3 cwt. of pearlash, yields from 2 to 2½ cwt. of commercial ferrocyanide. The mother-liquor contains sulphate of potassium.

Prop. It forms large and very beautiful yellow crystals, which are permanent in the air, and very tough and difficult to powder; it is soluble in 4 parts of cold and 2 parts of boiling water; has a mild saline taste; at a gentle heat loses water; at a higher temperature, in closed vessels, it is, for the most part, converted into cyanide of potassium, and, when

exposed to the air, into cyanate of potassium. Precipitates solutions of antimonous, bismuth, mercurous, and zinc salts, white; cadmium salts, of a pale yellow; cuprous salts, white, turning red; ferrous salts, white, turning blue; lead salts, white; manganous salts, white, turning red; mercuric salts, white, turning bluish; nickelous salts, white, turning green; silver salts, white; stannous salts, white; cobalt salts, green; cupric salts, chocolate red; ferric salts, dark blue; palladous salts, green; stannic salts, yellow; uranic salts, reddish brown; and zinc salts, white.

Uses, &c. Ferrocyanide of potassium is chiefly used in dyeing and calico-printing, in the manufacture of Prussian blue, in electro-plating, and, in chemistry, as a test, and a source of hydrocyanic acid. As a medicine, it is said to be sedative and astringent, and in large doses purgative, but appears to possess little action.—*Dose.* 10 grs. to ½ dr., dissolved in water; in whooping-cough, chronic bronchitis, night-sweats, leucorrhœa, &c. D'Arcet swallowed a solution containing ½ oz. of this salt without experiencing any injurious effects.

Potassium, Hydrate of. KHO . *Syn.* POTASSA HYDRATE, HYDRATE OF POTASSA, POTASSA CAUSTIC P., HYDRATED OXIDE OF POTASSIUM; POTASSA CAUSTICA (B. P.), POTASSA (Ph. E.), P. CAUSTICA (Ph. D.), P. HYDRAS (Ph. L.), P. FUSA. *Prep.* 1. (Ph. L.) Liquor of potassa, 1 gill; evaporate the water in a clean iron vessel over the fire until the ebullition being finished, the residuum of potassium hydrate liquefies; pour this into proper moulds.

2. (Ph. E. & D.) As the last, but pouring the fused hydrate upon a bright and clean iron plate (silver or iron dish—Ph. D.); as soon as it solidifies, break it quickly (into fragments), and put it into stoppered glass (green-glass—Ph. D.) bottles.

3. (Pure.) The hydrate, obtained as above, is dissolved in alcohol or rectified spirit, and, after repose for a few days in a closely stoppered green-glass or silver vessel, the solution is decanted, and cautiously evaporated in a deep silver basin, out of contact with the air.

Prop., &c. When perfectly pure, it is white, solid, very soluble in water and in alcohol; very deliquescent; intensely acrid and corrosive; and exhibiting the usual signs of alkalinity in the highest degree. That of the shops has usually a grayish or bluish colour.

Potassium, Iodate of. KIO_3 . *Syn.* POTASSÆ IODAS, L. *Prep.* Neutralise a hot solution of hydrate of potassium with iodine, evaporate to dryness by a gentle heat, powder the residuum, and digest it in alcohol, to remove iodide of potassium, dissolve the insoluble portion in hot water, and crystallise.

Obs. Iodate of potassium is resolved at a red heat into oxygen gas and iodide of potassium. It has been recommended in bronchocele.—

Dose. 1 to 5 grs.

Potassium, Iodide of. KI. *Syn.* POTASSII IODIDUM (B. P., Ph. L. E. and D.).

1. (Ph. L. 1836.) Take of iron filings, 2 oz.; distilled water, 2 quarts; iodine, 6 oz.; mix them, and heat the solution until it turns green, and then add of carbonate of potassium, 4 oz., dissolved in water, 1 quart; filter, wash the residuum on the filter with water, evaporate the mixed filtered liquors and crystallise. Product, 1 oz. of iodine yields 1 oz. 45 grs. of iodide.

The formulæ of the Ph. D. and Ph. E. are very similar.

2. Add iodine to a hot solution of pure hydrate of potassium, until the alkali is perfectly neutralised, carefully avoiding excess, evaporate the liquid to dryness, and expose the dry mass to a gentle red heat in a platinum or iron crucible; afterwards, dissolve out the salt, gently evaporate, and crystallise. An excellent process, yielding a large product, but, if the ignition be not carefully managed, it is apt to contain a little undecomposed iodate. To obviate this, Mr. Scanlan proposes the addition of a little powdered charcoal to the mass before ignition, a plan adopted in the Ph. U.S.

3. Iodine is treated with a small proportion of phosphorus in water, and is thus converted into 'hydriodic acid;' hydrate of calcium is then added, and the 'iodide of calcium' formed is first fused, and then decomposed by sulphate of potassium into 'sulphate of calcium,' which is precipitated, and 'iodide of potassium,' which remains in solution, and may be crystallised, as in the other processes. This is a modification of a method devised by Liebig.

Prop. It crystallises in cubes, which in the pure salt are extremely white, though frequently opaque; these are anhydrous; fuse when heated, without decomposition; dissolve in less than an equal weight of water, at 60° Fahr., and very freely in alcohol; and do not deliquesce in moderately dry air, unless they contain undecomposed hydrate of potassium. Its solution dissolves the iodine freely, and also, less readily, several of the insoluble metallic iodides and oxides.

Pur. It is entirely soluble in both water and alcohol. Its aqueous solution alters the colour of turmeric either not at all or but very slightly, nor does it affect litmus paper, or effervesce with acids. Nitric acid and starch being added together, it becomes blue. It is not coloured by the addition of tartaric acid with starch. No precipitate occurs on adding either a solution of hydrate of calcium or of chloride of barium. 100 grs., dissolved in water, by the addition of nitrate of silver, yield a precipitate of 141 grs. of iodide of silver.

Assay. The iodide of commerce frequently contains fully one half its weight of either chloride or carbonate of potassium, or both of them, with variable quantities of iodate of potassium, a much less valuable salt. The presence of these substances is readily de-

tected by the above tests. As the first of these is only very slightly soluble in cold alcohol, and the others insoluble in that liquid, a ready method of determining the richness of a sample in pure iodide, sufficiently accurate for ordinary purposes, is as follows:—Reduce 50 grs. of the sample to fine powder, introduce this into a test tube with 6 fl. drs. of alcohol, agitate the mixture violently for one minute, and throw the whole on a weighed filter set in a covered funnel, observing to wash what remains on the filter with another fl. dr. of alcohol. The filtrate, evaporated to dryness, gives the quantity of pure iodide, and the filter, dried by the heat of boiling water, that of the impurities present in the sample examined, provided it contained no hydrate of potassium. The quantity of alkali, whether hydrate or carbonate, may be found by the common method of 'alkalimetry.'

Uses, &c. Chiefly in medicine and pharmacy.—*Dose.* 1 to 10 grs., twice or thrice daily, made into pills, or, better, in solution, either alone or combined with iodine; in bronchocele, scrofula, chronic rheumatism, dropsy, syphilis, glandular indurations, and various other glandular diseases. Also externally, made into a lotion or ointment.

Potassium, Nitrate of. KNO_3 . *Syn.* NITRATE OF POTASH, NITRE, SALTPETRE; POTASSÆ NITRAS (B. P., Ph. L. E. & D.), NITRUM†, SAL NITR†, SAL PETR†, KALI NITRATUM†, L. This salt is produced naturally in the soil, by the action of the atmosphere, and crystallises upon its surface, in various parts of the world, especially in the East Indies. On the Continent it has long been produced artificially, by exposing a mixture of calcareous soil and animal matter to the atmosphere, when calcium nitrate is slowly formed, and is extracted by lixiviation. The liquid is then decomposed by the addition of wood ashes, or carbonate of potassium, by which carbonate of calcium is precipitated, and nitrate of potassium remains in solution. The places where these operations are performed are called 'nitrieries,' or 'nitrières artificielles.' The British market is wholly supplied from India. The salt of the first crystallisation, by either process, is called 'crude nitre' or 'rough saltpetre.' This is purified by solution in boiling water, skimming, and, after a short time allowed for defecation, straining (while still hot) into wooden crystallising vessels. The crystals thus obtained are called 'single refined nitre,' and when the process is repeated 'double refined nitre.'

1. (POTASSÆ NITRAS PURUM.—Ph. D.) Commercial nitre, 4 lbs.; boiling distilled water, 2 quart; dissolve, withdraw the heat, and stir the solution constantly as it cools; the minute crystals, thus obtained, are to be drained, and washed, in a glass or earthenware percolator, with cold distilled water, until that which trickles through ceases to give a precipitate with a solution of nitrate of silver, the contents

of the percolator are then to be withdrawn, and dried in an oven.

Prop. White, pellucid, six-sided prisms; permanent in the air; soluble in 7 parts of water at 60° and in 1 part at 212° Fahr.; insoluble in alcohol; its taste is cool, saline, and slightly bitter and pungent; at about 560° it fuses to an oily-looking mass, which concretes on cooling, forming 'sal prunella'; at a red heat it gives out oxygen, and, afterwards, nitrous fumes; sp. gr. 1.925 to 1.975.

Pur. Commercial nitre generally contains chlorides, sulphates, or calcareous salts. The first may be detected by its solution giving a cloudy white precipitate with nitrate of silver. The second by chlorides of barium or calcium giving a white precipitate, and the third by oxalate of ammonium giving a white precipitate.

Assay. Of the numerous methods prescribed for this purpose, few are sufficiently simple for mere practical men. The proportion of chlorides, sulphates, and calcareous salts, may be determined as above; and the general richness of the sample by the method of Gay-Lussac, modified as follows:—100 grs. of the sample (fairly chosen) are triturated with 50 grs. of lampblack and 400 grs. of common salt, and the mixture placed in an iron ladle, and ignited or fused therein, due care being taken to prevent loss; the residuum is exhausted with hot water, and the solution thus obtained tested by the usual methods of alkalimetry for carbonate of potassium. The quantity of carbonate found, multiplied by 2.125 or $2\frac{1}{4}$, gives the per-centage richness of the sample in nitrate.

Uses, &c. Nitre is chiefly employed in the manufacture of gunpowder, fireworks, and nitric acid. It is also used in medicine as a sedative, refrigerant, and diaphoretic, and as a cooling diuretic. It has been recommended in active hæmorrhages (especially spitting of blood), in various febrile affections, in scurvy, and in herpetic eruptions; and it has been highly extolled, by Dr. Basham, as a remedy in acute rheumatism.—*Dose.* 5 to 15 grs., every 2 hours. A small piece, dissolved slowly in the mouth, frequently stops a sore throat at the commencement. In large doses, it is poisonous. The best treatment is a powerful emetic, followed by opiates.

Potassium, Nitrite of. K_2NO_2 . *Syn.* NITRITE OF POTASSA; POTASSÆ NITRIS, L. *Prep.* 1. By heating nitre to redness, dissolving the fused mass in a little water, and adding twice the volume of the solution in alcohol; after a few hours the upper stratum of liquid is decanted, and the lower one, separated from the crystals, evaporated to dryness. 2. (Corenwinder.) Nitric acid, 10 parts, are poured on starch, 1 part, and the evolved gas passed through a solution of hydrate of potassium of the sp. gr. 1.380, to saturation; the liquid is then either neutralised with a little hydrate of potassium (if necessary), and kept in the liquid form, or at once evaporated.

Fused pinkish mass, or clear colourless soluble crystals, used in chemistry as a reagent, and deoxygeniser.

Potassium, Oxalate of. $K_2C_2O_4$. *Syn.* NEUTRAL OXALATE OF POTASSA; POTASSÆ OXALAS, L. *Prep.* Neutralise a solution of oxalic acid, or the acid oxalates, with carbonate of potassium, evaporate, and crystallise. Transparent colourless rhombic prisms, soluble in 3 parts of water, and of the formula $K_2C_2O_4$, Aq.

Potassium, Hydrogen Oxalate of. K, H, C_2O_4 . *Syn.* POTASSIUM BINOXALATE, SALT OF SORREL, ESSENTIAL SALT OF LEMONS; POTASSÆ BINOXALAS, L. *Prep.* By saturating a solution of oxalic acid, 1 part, with carbonate of potassium, adding to the mixture a similar solution of 1 part of oxalic acid, unneutralised, and evaporating for crystals. It may also be obtained from the expressed juice of wood or sheep's sorrel, by clarifying it with eggs or milk, and evaporating, &c., as before. Colourless rhombic crystals of the formula KHC_2O_4 , Aq, soluble in 40 parts of cold and 6 parts of boiling water, yielding a very sour solution.

Potassium, Trihydrogen Oxalate of. $KH_3(C_2O_4)_2$, or $KHC_2O_4, H_2C_2O_4$. *Syn.* POTASSIUM QUADROXALATE, POTASSIUM ACID OXALATE. *Prep.* By neutralising 1 part of oxalic acid with carbonate of potassium, adding to the solution 3 parts more of oxalic acid, evaporating and crystallising. Resembles the last; has the formula $KH_3(C_2O_4)_2, 2Aq$; but is less soluble, and more intensely sour, and forms modified octahedral crystals. This salt is occasionally sold under the names of 'sal acetosellæ,' 'salt of sorrel,' and 'essential salt of lemons.' Both are used to remove ink and iron stains from linen, to bleach the straw used for making bonnets, and, occasionally, in medicine, as a refrigerant.

Potassium, Oxide of. K_2O . *Prep.* Burn pure potassium in a current of oxygen. White powder, rapidly absorbing water and forming the hydrate.

Potassium, Perchlorate of. $KClO_4$. *Syn.* POTASSÆ PERCHLORAS, L. Prepared by projecting well-dried and finely powdered chlorate of potassium, in small portions at a time, into warm nitric acid. The salt is separated from the 'nitrate' by crystallisation.

Potassium, Prussiate of. See POTASSIUM FERRICYANIDE and FERROCYANIDE.

Potassium, Saccharate of. Formed by mixing salicylous acid (artificial oil of meadow-sweet) with a strong solution of hydrate of potassium; it separates, on agitation, as a yellow crystalline mass, which, after pressure in bibulous paper, is recrystallised from alcohol. Golden-yellow crystals, soluble in both water and alcohol; damp air gradually converts them into acetate of potassium and melanic acid.

Potassium, Sulphate of. K_2SO_4 . *Syn.* POTASSÆ SULPHAS (B. P., Ph. L. E. & D.). *Prep.* The sulphate of potassium of commerce is a secondary product of several chemical and

manufacturing processes. Thus, the residuum of the distillation of nitric acid from nitre is dissolved in water, the solution neutralised with carbonate of potassium, and, after defecation, evaporation until a pellicle forms; it is then strained, or decanted, and set aside to crystallise. Or, the residuum is simply ignited, to expel excess of acid, and then dissolved, and crystallised, as before.

Prop., &c. Anhydrous, heavy, quartz-like crystals; permanent in the air; soluble in 12 parts of water at 60° and in 5 parts at 212° Fahr.; insoluble in alcohol; extremely nauseous, and bitter-tasted. It crepitates on the application of heat; fuses at a red heat, but loses nothing in weight. 100 grs., dissolved in distilled water, on the addition of chloride of barium and hydrochloric acid, furnish 132 grs. of sulphate of barium, dried at a red heat.

Potassium, Bisulphate of. KHSO_4 . *Syn.* POTASSIUM-HYDROGEN SULPHATE, ACID POTASSIUM SULPHATE; POTASSÆ BISULPHAS. *Prop.* 1. (Anhydrous.) Neutral sulphate of potassium and oil of vitriol, equal parts; hot water, q. s. (not more) to dissolve; anhydrous bisulphate crystallises out, in long delicate needles, as the solution cools. If these are left for several days in the mother-liquor, they are redissolved, and crystals of the ordinary hydrated bisulphate are deposited.

2. (Hydrated.)—*a.* (Ph. L. 1836.) Salt left in distilling nitric acid, 2 lbs.; boiling water, 3 quarts; dissolve; add of sulphuric acid, 1 lb.; concentrate by evaporation, and set the liquid aside, so that crystals may form.

b. (Ph. D.) Sulphate of potassium (in powder), 3 oz.; sulphuric acid, 1 fl. oz.; mix them in a porcelain capsule, and expose it to a heat capable of liquefying its contents, until acid vapours cease to be evolved; powder the residuum, and preserve it in a well-stopped bottle.

Prop., &c. Sour and slightly bitter-tasted rhombic prisms; soluble in about 2 parts of cold and 1 part of boiling water, the solution exhibiting a strongly acid reaction. It is much employed, in lieu of tartaric acid, for the production of carbonic acid, in 'gazogenes,' &c.; also to adulterate cream of tartar and tartaric acid. According to Dr. Paris, it forms a "grateful adjunct to rhubarb."—*Dose.* 12 grs. to 1½ dr., in solution, combined with rhubarb or bitters, as the neutral sulphate.

Potassium, Sulphocyanide of. KCNS , or KCyS . *Syn.* SULPHO-CYANURET OF POTASSIUM; POTASSII SULPHOCYANIDUM, P. SULPHO-CYANURETUM, L. *Prop.* 1. Ferrocyanide of potassium (anhydrous, or dried by a gentle heat), 46 parts; sulphur, 32 parts; pure carbonate of potassium, 17 parts; reduce them to powder, and very gradually heat the mixture to low redness in a covered iron crucible, which it will less than one half fill; remove the half-refrigerated and still soft mass, crush it, ex-

haust it with water, and evaporate the aqueous solution to dryness; powder the residuum, and exhaust it with hot alcohol or rectified spirit; the alcoholic solution will yield beautiful white crystals as it cools, and the residuum or mother-liquor may be evaporated for the remainder of the salt.

2. Cyanide of potassium, 3 parts; sulphur, 1 part; water, 6 parts; digest them together for some time, add 3 parts more of water, filter, evaporate, and crystallise.

Prop., &c. Long, slender, colourless prisms or plates, which are anhydrous, bitter-tasted, deliquescent, fusible, very soluble in both water and alcohol, and non-poisonous. It is chiefly used as a test for ferric oxide, for which purpose it is preferable to all other substances.

Potassium, Sulphide of. *Syn.* SULPHURET OF POTASSIUM, LIVER OF SULPHUR†; POTASSII SULPHURETUM (Ph. L. E. & U.S.), HEPAR SULPHURIS (Ph. D.), L. *Prop.* 1. (Ph. E.) Sulphur, 1 oz.; carbonate of potassium, 4 oz.; mix, heat them in a covered crucible till they form a uniform fused mass; when cold, break it into fragments, and preserve it in well-closed vessels. The formulæ of the Ph. L. 1836 and Ph. U.S. are similar.

2. (Ph. D.) Sublimed sulphur, 4 oz.; carbonate of potassium (from pearlsh, first dried, and then reduced to powder), 7 oz.; mix in a warm mortar, heat them in a Hessian crucible, as before, pour the fused mass into an iron cup, over which immediately invert a second vessel, to exclude the air, and, when cold, break the mass into fragments, and preserve it in a green-glass stoppered bottle.

Prop., &c. A hard, brittle, liver or greenish-brown coloured solid; inodorous whilst dry; soluble in water, forming a highly fetid solution; and, in acids, evolving strong fumes of sulphuretted hydrogen; reaction, alkaline; exposed to the air, it is gradually converted into sulphate of potassa. As a medicine, it is reputed diaphoretic, expectorant, and stimulant.—*Dose.* 2 to 6 grs., in solution, or made into pills with soap; in gout, rheumatism, liver affections, and various chronic skin diseases. Externally, made into a lotion and ointment. It is highly acid and corrosive, and in large doses poisonous.

Potassium, Tartrate of. $\text{K}_2\text{C}_4\text{H}_6\text{O}_6$. *Syn.* NEUTRAL TARTRATE OF POTASSIUM, TARTRATE OF POTASSA, NEUTRAL TARTAR, SOLUBLE T.; POTASSÆ TARTRAS (B. P., Ph. L. E. & D.), KALI TARTARIZATUM†, L. *Prop.* (Ph. D.) Carbonate of potassium, 8 oz.; distilled water, 2 quarts; dissolve, and to the solution, whilst boiling hot, gradually add of bitartrate of potassium, in fine powder, 1 lb., or q. s., so that the liquid, after ebullition for a couple of minutes, ceases to change the colour of either blue or reddened litmus paper; next filter the liquid through calico, evaporate it until a pellicle forms on the surface, and set it aside to

crystallise; after 12 hours, collect the crystals, dry them on bibulous paper, and preserve them from the air. The formula of the Ph. L. 1836 is nearly similar.

Prop., &c. The crystals of this salt, which are obtained with difficulty, are right rhombic prisms, and are deliquescent. The salt of commerce is usually in the form of a white granular powder, which is obtained by simply evaporating the solution to dryness, with constant stirring. In this state it requires about 4 parts of cold water for its solution. Acids convert it into the bitartrate. As a medicine, it acts as a gentle diuretic and aperient, and is valued for correcting the griping properties of senna and resinous purgatives. It is also antiscorbutic.—*Dose.* $\frac{1}{2}$ dr. to $\frac{3}{4}$ oz., in powder, or dissolved in water. The solution changes the colour neither of litmus nor turmeric. The addition of almost any acid throws down crystals of bitartrate of potassium, which generally adhere to the vessel. The precipitate occasioned by either chloride of barium or acetate of lead is dissolved by dilute nitric acid.

Potassium, Bitartrate of. $\text{KHC}_4\text{H}_4\text{O}_6$. *Syn.* ACID TARTRATE OF POTASSA, SUPER-TARTRATE OF P., CREAM OF TARTAR; CREMOR TARTARI, POTASSÆ BITARTRAS (B. P., Ph. L. E. & D.), POTASSÆ SUPER-TARTRAS, TARTARI CRYSTALLI, L. This well-known salt is deposited during the fermentation of grape juice, as a crust on the sides of the casks or vats. In its unprepared or crude state, it is called white or red tartar or argol, according to the wine from which it has been obtained. It is purified by boiling it in water, crystallisation, resolution in water, and treatment with freshly burnt charcoal and aluminous clay, to remove the colour; the clear liquid is then decanted, whilst still hot, and allowed to cool slowly; the resulting crystals form the 'cream of tartar' of commerce.

Prop., &c. Small, translucent, gritty, prismatic crystals, irregularly grouped together; permanent in the air; requiring fully 100 parts of cold water, and about 15 parts of boiling water, for their perfect solution; the solution has a harsh, sour taste, and, like that of the tartrate, suffers spontaneous decomposition by keeping. Its solution reddens litmus. At a red heat, it is converted into carbonate of potassium. Entirely soluble in 40 parts of boiling water; 40 grs., in solution, are neutralised by 30 grs. of crystallised carbonate of soda.—*Dose.* As an aperient, 1 to 3 drs.; as a diuretic, $\frac{1}{2}$ dr. to 1 dr.; as an antiscorbutic, 10 to 20 grs., frequently. It is much used to make a pleasant cooling drink ('Imperial'), and in tooth-powders.

POTATO. This well-known and valuable article of food is the tuber of the *Solanum tuberosum* or *esculentum*, a plant which was introduced to this country by either Sir Francis Drake or Sir Walter Raleigh, towards the latter part of the 16th century. It is now extensively cultivated in all the temperate cli-

mates of the world. It yields a vast quantity of food on a small space of ground, but only about 1-7th part of the weight of the tuber is nutritious, and this is chiefly farinaceous. Its farina or starch is, however, accompanied by no inconsiderable portion of saline matter, more especially of potassa, which renders it highly antiscorbutic, and a powerful corrective of the grossness of animal food. When forming part of a mixed diet, perhaps no substance is more wholesome than the potato, and, certainly, no other esculent hitherto discovered appears equally adapted for universal use.

No certain rule can be laid down for 'dressing' potatoes. "If boiled, it may be that they require to be put into boiling water, or may be, into cold, and either boiled quickly or slowly; but this you must find out. Choose them all about the same size, with a smooth skin, and when they are boiled and begin to crack, throw off the water immediately, as it only damages the root. When dressed, let them stand near the fire, with a cloth over them, and serve them in the skins. Salt may be put into the water at the beginning. A watery potato will require quick boiling, and, sometimes, to be put into boiling water." (Soyer.)

To retain the highest amount of nourishment in potatoes, they should be 'dressed' with their skins on them. The bruised or damaged parts, worm-holes, &c., being removed with a knife, the dirt should be carefully cleaned out of the "eyes," and from the rough parts of the skins, by means of a brush and water, after which they should be well rinsed in clean water, and drained in a colander. If they are at all dry or shrivelled, they may be advantageously left to soak for 3 or 4 hours in clean cold water before cooking them. Potatoes 'dressed' in the skins have been found to be nearly twice as rich in potassa-salts as those which have been first peeled. The skins are easily removed before sending them to table.

NEW POTATOES should have their loose outer skin rubbed off with a cloth or stiff brush before being dressed or cooked.

MASHED POTATOES are prepared by crushing, with the back of a spoon, or with a rolling-pin, the hot 'dressed' tubers, placed in a bowl or dish, or on a pie-board. A little milk, butter, and salt, may be added to them at will; and they may be either at once 'served up,' or pressed into 'forms,' and first 'browned off' in the oven. Potatoes, if not soft and mealy, and well masticated, frequently escape the solvent action of the stomach, and pass off undigested, often to the serious derangement of the health. By mashing them, this inconvenience is removed. The delicate, the dyspeptic, and the aged, should take them in no other form.

Potatoes may be preserved, so as to stand the longest voyages unchanged, by thoroughly desiccating them in an oven, or by steam heat. For this purpose, the roots, either raw or

three parts dressed, are generally first cut into dice of above $\frac{3}{4}$ inch square, to facilitate the operation. Under a patent granted to Mr. Downes Edwards, Aug., 1840, the boiled potatoes are mashed and granulated, by forcing them through a perforated plate, before drying them. The granulated product, beaten up with a little hot milk or hot water, forms an excellent extemporaneous dish of mashed potatoes.

POT POURRI. [Fr.] A mixture of odorous flowers, roots, gums, &c., varied according to the taste of the operator, either mixed together dry, or in the fresh state preserved with salt. "The usual way of making it is to collect roses, lavender, and other sweet-scented flowers, as they blow; to put them into a large jar mixed (stratified) with salt, until a sufficient quantity has been collected; then to add to these such other odorous substances as may be required to form an agreeable perfume." Among the substances thus added are—ambergis, benzoin, calamus root, cascarilla, cassia, cassia buds, cinnamon, civet, cloves, musk, musk seed, orange berries and flowers, orris root, pimento, storax, vanilla, yellow sandal wood, &c.

"Instead of the fresh flowers, dried roses are sometimes used, and, with the addition of some essential oils, these answer quite as well." (Redwood.)

POTTED MEATS. See PUTREFACTION and POTTING (*below*).

POTTERY. The mechanical operations connected with the manufacture of pottery (CERAMIC ART) do not come within the province of this work. The materials employed, in this country, to produce the best kind of earthenware (STAFFORDSHIRE WARE) are the fine white clays of Devonshire and Cornwall, and powdered chert or flint. This is brought to a perfectly homogeneous plastic mass with water, and in this state is fashioned upon the potter's wheel and lathe, or by moulding, into all the varied objects of utility and ornament which are made in this material. After the newly formed vessels and other articles have been dried by exposure in heated rooms, they are enclosed in clay cases (SEGGARS) and exposed to heat in a kiln, by which they arrive at a state (BISCUIT) which renders them fit for glazing; the patterns (if any) and, afterwards, appropriate vitreous materials having been applied to their surfaces, they are again placed in the seggars, and are again exposed in a kiln to a heat sufficiently high to fuse the newly applied compound, by which they acquire a uniform enamelled surface, and become fit for the market. PORCELAIN, or CHINA, as it is commonly called, is manufactured in a nearly similar manner, but the materials are selected and the various processes conducted with corresponding skill and care.

The ornamental patterns are produced upon both Staffordshire ware and porcelain by a number of ingenious processes, among which

printing, painting, and moulding, are the principal. The colours employed are those which have been already referred to under ENAMELS.

The metallic lustres now so common on stoneware, &c., are given as follows:—

1. **GOLD LUSTRE.** Dissolve grain-gold, 1 dr., in aqua regia, $\frac{3}{4}$ oz.; to the solution add of metallic tin, 6 grs.; and when this is dissolved, pour it very gradually, with constant stirring, into a mixture of balsam of sulphur, $\frac{1}{2}$ dr.; oil of turpentine, 20 grs.; when the mass begins to stiffen, $\frac{1}{2}$ dr. more of oil of turpentine must be added, and well mixed in. More gold deepens and brightens the lustre; more tin turns it on the violet or purple.

2. **IRON LUSTRE.** From a mixture of 'muriate of iron' (ferric chloride) and spirit of tar.

3. **PLATINUM LUSTRE.** To a solution of platinum in aqua regia (platinic chloride) is added, drop by drop, a mixture of spirit of tar and balsam of sulphur in equal proportions, until by a trial the composition is found to give the required result. This gives the appearance of polished steel.

4. **SILVER LUSTRE.** The ammonio-chloride of platinum is reduced to an impalpable powder, ground up to the requisite consistence with a little spirit of tar, and at once applied with a brush.

The above lustres are applied, over an easily fusible glaze, to the outer surfaces only of the vessels, after which adhesion is produced by exposing the pieces to a slight degree of heat in the muffle. To give them their full beauty, they must be rubbed with cotton, wool, or chamois leather, after the firing. See ALUMINA, CLAY, ENAMELS, GILDING, GLAZES, KAOLIN, &c.

POTTING. A term commonly applied to the operation or practice of preserving animal substances in a state fit for immediate use, in small pots or jars. The method of proceeding is, first, to mince the substance (previously well dressed, and carefully deprived of bones, sinews, skin, &c.), and, next, to pound it in a clean polished marble or iron mortar, along with a little butter and some cayenne pepper, or other suitable spice or sauce, until it forms a perfectly smooth paste; this is pressed into the pots, so as to about 2-3rds fill them, and clarified melted butter is then poured in to the depth of about 1-8th of an inch; the pots are, lastly, closely covered over, and kept in a cool situation. In this state their contents may be preserved for a year, or longer. Potted beef, ham, veal, poultry, game, anchovies, bloaters, salmon, &c., are commonly sold in the shops. They are all intended for relishes, and are spread upon bread, in the same manner as butter.

POUDRE KOUSIQUE. [Fr.] A French nostrum, consisting of nitre and sulphur, of each, 50 parts; charcoal and antimony, of each, 1 part. It is divided into $\frac{1}{2}$ -dr. doses, of which

three are put into each packet. It is given to dogs in a ball of butter, to prevent the disorders to which they are liable.

POUDRE METALLIQUE. [Fr.] See TOOTH CEMENTS.

POUDRE SUBTILE. [Fr.] See DEPLATORY.

POUDRETTE. [Fr.] Dried night-soil. The manure sold under this name is a compound of night-soil with clay, charcoal, or gypsum, made into balls or cakes. Its extensive use in Belgium, France, the United States of America, and, more particularly, in China, where it was first employed, has shown it to be the most fertilising and generally applicable of all the numerous substances used as manure. Unfortunately, the prejudices of Englishmen lead them to poison the air of their cities and towns, and the water of their rivers, with a substance which, if rightly applied, would crown their fields with golden harvests, and drive pauperism from the land.

POULTICE. *Syn.* CATAPLASM; CATAPLASMA, L. An external application, generally extemporaneous, used to promote suppuration, allay pain and inflammation, resolve tumours, &c.

Poultices (cataplasmata) are generally prepared with substances capable of absorbing much water, and assuming a pulpy consistence, so as to admit of their application to any surface, however irregular. Their curative action principally depends upon the liquids with which they are moistened, and the heat retained by the mass. With this object they should never be heavy, or very bulky, and should be frequently repeated, and lightly, but securely, bandaged on, to prevent displacement.

The addition of a little lard, olive oil, or, still better, glycerin, to a poultice, tends greatly to promote its emollient action, and to retard its hardening.

As the continued medication of the part with warmth and moisture, or with substances applied in the moist way, is the principal object to be attained in the application of poultices, a fold or two of lint or soft linen dipped in hot water, either simple or medicated, and covered with a piece of thin sheet gutta percha or India-rubber cloth, to prevent evaporation, may be often conveniently applied in their stead. A very elegant and useful substitute of this kind is sold under the name of 'spongio piline.' Its cleanliness, lightness, and ease of application, has led to its extensive adoption by the medical profession.

The following formulæ embrace all the cataplasma of the Pharmacopœias:—

Poultice of Al^um. *Syn.* CATAPLASMA ALUMINIS, L. *Prep.* (B. P., Ph. D. 1826.) Alum (in powder), 1 dr.; whites of 2 eggs; shake them together until they form a coagulum. Applied, between the folds of fine linen, to chilblains, sore nipples, inflamed eyes, &c.

Poultice of Bread. *Syn.* CATAPLASMA PANIS, L. *Prep.* From crum of bread, soaked in hot water, slightly pressed, and then beaten up

with a little lard, butter, or oil. Emollient. See LINSÉED MEAL POULTICE (*below*.)

Poultice of Carrot. *Syn.* CATAPLASMA DAUCI, L. *Prep.* 1. From the common esculent carrot, scraped fine, so as to form a pulp.

2. (Ph. D. 1826.) From the cultivated carrot boiled with a little water, until it becomes soft enough to form a poultice. Anodyne and antiseptic. Used in foul and painful ulcers, burns, contusions, &c. That from the first formula is the more stimulant.

Poultice of Charcoal. *Syn.* CATAPLASMA CARBONIS (B. P., Ph. L.), C. c. LIGNI, L. *Prep.* 1. (Ph. L.) Soak bread, 2 oz., in boiling water, $\frac{1}{2}$ pint; to this add, by degrees, of linseed meal, 10 drs., and, afterwards, of powdered (recently burnt) charcoal, 2 drs.; lastly, sprinkle on the surface of the poultice powdered charcoal, 1 dr. As an application to fetid and gangrenous sores; frequently renewed.

2. (B. P.) Wood charcoal, $\frac{1}{2}$ oz.; bread, 2 oz.; linseed meal, $1\frac{1}{2}$ oz.; boiling water, 10 oz.; soak the bread in the water near the fire, add the linseed meal and half the charcoal, stirring to a soft poultice, sprinkling the remainder of the charcoal on the surface.

Poultice of Chloride of Soda. *Syn.* CATAPLASMA SODÆ CHLORINATÆ (B. P., Ph. L.), L. *Prep.* 1. (Ph. L.) Boiling water, 6 fl. oz.; linseed meal, 4 $\frac{1}{2}$ oz.; mix gradually, then add of solution of chlorinated soda, 2 fl. oz. Applied to foul ulcers, gangrenous parts, &c.

2. (B. P.) Solution of chlorinated soda, 1; linseed meal, 2; boiling water, 4; add the linseed meal gradually to the water, stirring constantly, then mix the solution of chlorinated soda.

Poultice of Hemlock. *Syn.* CATAPLASMA CONII (B. P., Ph. L.), L. *Prep.* 1. (Ph. L.) Boiling water, $\frac{1}{2}$ pint; linseed meal, 4 $\frac{1}{2}$ oz., or q. s.; make a poultice, and on this spread of extract of hemlock (Ph. L.), 1 oz., first softened with a little hot water. Anodyne. In irritable and painful cancerous, scrofulous, and syphilitic sores, tumours, &c.

2. (B. P.) Hemlock leaf, in powder, 1 oz.; linseed meal, 3 oz.; boiling water, 10 oz.; mix the ingredients, then add them to the water gradually, constantly stirring.

Poultice of Linseed Meal. *Syn.* CATAPLASMA LINI (B. P., Ph. L.), L. *Prep.* 1. (Ph. L.) To boiling water, $\frac{1}{2}$ pint, add, gradually, constantly stirring, of linseed meal, 4 $\frac{1}{2}$ oz., or q. s. Emollient. Used to promote the suppuration or 'ripening' of tumours. A little oil or lard should be added, and some smeared over the surface as well, to prevent its getting hard. For small 'gatherings,' as of the fingers, a little chewed bread and butter is an efficient and convenient substitute.

2. (B. P.) Linseed meal, 4; olive oil, $\frac{1}{2}$; boiling water, 10; mix the linseed meal with the oil, add the water gradually, constantly stirring.

Obs. Linseed meal prepared from the cake, from which the oil has been expressed, is less adapted for poultices than that prepared from the unpressed, whole seed. The latter is ordered in the Ph. L.

Poultice of Mustard. *Syn.* CATAPLASMA SINAPIS (Ph. L.), L. *Prep.* 1. (B. P., Ph. L.) Linseed meal and powdered mustard, of each, 2½ oz., or q. s.; boiling water, ½ pint; mix as before.

2. (Ph. L. 1836.) As the last, but substituting boiling vinegar for water. *Used* as a powerful counter-irritant, stimulant, and rubefacient; in low fevers, apoplexy, coma, &c., where there is a determination of blood to the head; in deep-seated inflammatory pains, neuralgic pains, &c. It should not be left on long enough to raise a blister. See PLEASTERS.

Poultice of Pop'py. *Syn.* CATAPLASMA PAPAVERIS, L. *Prep.* 1. (P. Cod. 1839.) A strong decoction of poppies, thickened with crum of bread. Anodyne.

Poultice of Potat'o. *Syn.* CATAPLASMA SOLANI TUBEROSI, L. *Prep.* From the raw potato, scraped or grated fine. A popular application to fresh bruises, extravasations, burns, scalds, &c.

Pradier's Poultice. *Syn.* PRADIER'S CATAPLASMA; CATAPLASME DE PRADIER, Fr. *Prep.* Take of balsam of Mecca, 6 drs.; rectified spirit, 16 oz.; dissolve; next, separately, take red cinchona bark, sarsaparilla, and sage, of each, 1 oz.; saffron, ¼ oz.; rectified spirit, 32 oz.; digest for 48 hours, and filter; mix the two liquors, add to them twice their weight of lime water. In gout; 2 fl. oz. are sprinkled on the surface of a hot linseed-meal poultice sufficiently large to surround the affected part. It is said that the Emperor Napoleon gave £2500 for this receipt.

Simple Poultice. *Syn.* CATAPLASMA SIMPLEX, L. *Prep.* (Ph. D. 1826.) Powder for a cataplasma and boiling water, of each, q. s. to form a poultice, the surface of which is to be smeared over with olive oil. Emollient. Bread poultice and linseed-meal poultice are now generally called by this name. See POWDER (Poultice).

Poultice of Soap. *Syn.* CATAPLASMA SAPONIS, L. *Prep.* From white soap (scraped or sliced), 1 oz.; boiling water, ½ pint; dissolve, and add crum of bread, q. s. As an application to scalds and burns.

Poultice of Vinegar. *Syn.* CATAPLASMA ACETI, L. *Prep.* From crum of bread soaked in vinegar. Applied cold in bruises, extravasations, &c., especially black eyes. Verjuice is often employed in the same way.

Poultice of Yeast. *Syn.* CATAPLASMA FERMENTI (B. P., Ph. L.), C. F. CEREVISIÆ, L. *Prep.* 1. (Ph. L.) Beer yeast and water at 100° Fahr., of each, 5 fl. oz.; mix, stir in flour, 1 lb., and place it near the fire until it rises. In gangrenous or foul ulcers; to correct the fetor of the discharge, and to hasten the sloughing.

2. (B. P.) Beer yeast, 6; flour, 14; water (at 100° Fahr.), 6; mix. Place the mass near the fire till it rises.

POULTRY. Domestic birds, which are propagated and fed for the table, and for their eggs, feathers, &c.

The poultry of this country are the common domestic fowl, the turkey, the duck, and the goose; to which some writers add the guinea fowl and the peacock. Of these, the first is the most generally useful. Though a native of India, it accompanies man through almost every gradation of civilisation and climate, and flourishes almost everywhere, when properly secured from the inclemency of the weather, and allowed an ample supply of fresh air, with proper food. For the production of abundance of eggs, it must, however, be well fed and warmly lodged. The hen-roosts and poultry-houses should be well protected from the weather, and their temperature should be duly maintained by proximity to the stables, cow-houses, or dwelling-house, and, in cold weather, by the employment, when necessary, of artificial heat. The food should also contain an ample supply of nitrogenous matter, for without this how can it be expected that hens can produce abundance of eggs, which are peculiarly rich in nitrogen. The 'greaves' of the tallow-chandlers, and such-like substances, are hence excellent additions to the ordinary food of poultry. But it is not sufficient merely to supply poultry with abundance of food and warmth; it is equally necessary that they should have ample space for exercise and recreation. This space "should always contain living plants of various kinds, and some gravelly or sandy soil; because worms, snails, as well as, occasionally, grass and herbage, form a part of the food of poultry; and sand or gravel is swallowed by them for the purpose of promoting digestion." Hence, no healthy poultry can ever be reared in towns, however much the natural food may be imitated by the supply of animal matters, herbage, and sand." (London.)

POUNCE. Powdered gum sandarac generally passes under this name. It is used to prepare parchment for writing on, and to prevent ink from spreading upon paper after erasures. Powdered cuttle-fish bone is occasionally employed in the same way. Both are applied to the surface by means of a cylindrical roll of list, called a 'rubber.' Packers rub the surface of porous and greasy woods, as the heads of boxes, cases, casks, &c., with whiting or powdered resin, to make them bear the ink. The coloured powders used by pattern drawers, for sprinkling over pricked papers, are also called 'pounce.' For liquid pounce, see MARKING INK.

POWDER. *Syn.* PULVIS, L. Powders are divided by pharmaceutical writers into two classes—simple and compound. The first are prepared by simple pulverisation; the second, by the admixture or two or more simple

powders. For use, the appropriate doses are separately weighed, and placed in separate papers. They are usually exhibited in a little honey, sugar, or milk, either taken from a spoon or made into an electuary or bolus, and swallowed in the semi-solid form. Metallic and other heavy powders are best taken in the latter state. Very active substances should be, in all cases, mixed with some inert powder, as that of starch, gum, liquorice, or marsh-mallow, at the time of 'dispensing' them.

"This form of preparing medicines is the simplest, and perhaps the least objectionable; but it is not applicable to all the articles of the *Materia Medica*. Those remedies which are very unpleasant to the taste; those which deliquesce rapidly when exposed to the air, or are very volatile; and those which require to be given in very large doses, or which are not diffused readily in water, cannot, with propriety, be administered in the form of powder. Some substances cannot be reduced to powder unless they be very much dried, and the heat necessary for that purpose alters their properties." Nor can we "be surprised that a great alteration should be effected in a short time by the action of the air on so great an extension of surface as takes place in the operation usually adopted for reducing drugs to a fine powder." (A. T. Thomson.)

In this country, compound powders appear to be a favourite form of medicine in the diseases of infancy and childhood.

"It is necessary that whatever we order to be reduced to powder should be rubbed through a fine sieve, so that the impurities and coarser parts may be separated; and it is needful that most powders should be recently prepared, and not too long kept." (Ph. L.)

"As nearly all powders suffer by exposure to the air and light, they should be preserved in closely corked opaque or green-glass bottles, or in tin canisters from which the external air is carefully excluded. See PULVERISATION, &c.

Powder, Algaroth's. See OXYCHLORIDE OF ANTIMONY (*page 122*).

Powder of Aloes (Compound). *Syn.* PULVIS ALOËS COMPOSITUS (Ph. L.), P. ALOËS CUM GUAIACO, L. *Prep.* (Ph. L.) Socotrine or hepatic aloes (in powder), 1½ oz.; guaiacum (in powder), 1 oz.; compound cinnamon powder, ¼ oz.; rub them together. A warm, sudorific purgative.—*Dose.* 10 to 20 grs.

Powder of Aloes with Camellia. *Syn.* ALOETIC POWDER, HOLY BITTER†; HIERA PICRA†, PULVIS ALOËS CUM CANELLÂ, L. *Prep.* From powdered Socotrine or hepatic aloes, 4 parts; powdered white camella, 1 part. *Uses and dose,* as the last.

Obs. Once a highly popular remedy. It was originally made into an electuary with honey, and in this form was frequently called 'HIERA LOGADII.' It is still a favourite in domestic medicine and veterinary practice. The principal objection to both this and the

preceding preparation is the nauseous flavour of the aloes, which is ill concealed by the aromatics. The 'HIERA PICRA' for farriers is usually made with the cheapest Cape aloes.

Powder of Alum (Compound). *Syn.* STYPTIC POWDER; PULVIS STYPTICUS, P. ALUMINIS COMPOSITUS (Ph. E.), L. *Prep.* (Ph. E.) Alum, 4 oz.; kino, 1 oz.; mix them, and reduce them to fine powder. Astringent and styptic.—*Dose.* 5 to 15 grs.; in diarrhoea, profuse menstruation, &c. Externally, in hæmorrhages, &c.

Powder of Anchovy. *Syn.* PULVIS CLUPEÆ ENCRASICOLI, L. *Prep.* Pound anchovies to a paste, then rub them through a sieve, and add enough flour to make a dough, which must be rolled out into thin slices and dried by a gentle heat in a stove; it is, lastly, powdered and bottled. Colouring is frequently added. Chiefly used to make sauces. British anchovies are frequently substituted for the genuine fish.

Powder, Antimo'nial. *Syn.* FEVER POWDER, LISLE'S P., JAMES'S P.; PULVIS JACOBI, PULVIS ANTIMONIALIS (B. P., Ph. E. & D.), PULVIS ANTIMONII COMPOSITUS (Ph. L.), L. *Prep.* 1. (Ph. L.) A mixture of tersulphide of antimony, 1 lb., and hartshorn shavings, 2 lbs., is reduced to powder, thrown into a crucible heated to whiteness, and stirred constantly until vapour no longer rises; the calcined mixture is then rubbed to powder, again put into the crucible, and the heat gradually increased to whiteness, and maintained so for 2 hours; the residuum is, lastly, reduced to a very fine powder.

2. (Ph. E.) From sulphide of antimony and hartshorn shavings, equal weights; as the last.

3. (Ph. D.) Tartarised antimony, 4 oz., is dissolved in water, ½ gall., and added to solution of phosphate of soda, 4 oz., in water, 1 quart; a solution of chloride of calcium, 2 oz., in water, 1 quart, and to which solution of ammonia (Ph. D.), 4 fl. oz., has been added, is next poured in, and the whole boiled for 20 minutes; the precipitate is then collected on a calico filter, and washed with hot distilled water, until the liquid which passes ceases to give a precipitate with a weak solution of nitrate of silver; it is, lastly, dried by a steam or water heat, and reduced to a fine powder.

4. (B. P.) Oxide of antimony, 1; precipitated phosphate of lime, 2; mix.—*Dose.* 2 to 6 grs.

Uses, &c. Febrifuge and diaphoretic. Intended as a substitute for the proprietary and more expensive JAMES'S POWDER.—*Dose.* 3 to 10 or 12 grs., or more, repeated every fourth or fifth hour until diaphoresis is set up; in fevers, rheumatic affections, chronic skin diseases, &c. It is a very uncertain and variable compound, unless it has been carefully prepared. Dr. Elliotson exhibited it in doses of 100 grs., without producing any sensible effect.

A spurious article, made by triturating 1 oz. of tartar emetic with 18 or 19 oz. of burnt hartshorn, is frequently sold for it in the shops. See ANTIMONIOUS ACID and JAMES'S POWDER.

Powder, Aromatic. See COMPOUND CINNAMON POWDER.

Powder, Arsenical. See ESCHAROTIC POWDER.

Powder of Asarabacca (Compound). See SNUFF (Cephalic).

Powder, Astringent. *Syn.* PULVIS ASTRINGENS, P. STYPTICUS, L. *Prep.* From Aleppo galls and burnt alum, in fine powder, equal parts. *Used* in piles, soft polypi of the nose, chilblains, &c.

Powder, Ba'king. *Prep.* 1. Tartaric acid, $\frac{1}{2}$ lb.; bicarbonate of soda and potato farina or British arrow-root, of each, $\frac{1}{2}$ lb. (each in powder); separately dry them perfectly by a very gentle heat, then mix them in a dry room, pass the mixture through a sieve, and at once put it into packets, observing to press it hard, and to cover it with tinfoil or close-made paper, to preserve it as much as possible from the air and moisture.

2. (Delforte's.) Powdered tartaric acid, $\frac{1}{4}$ lb.; powdered alum, $\frac{1}{2}$ lb.; bicarbonate of soda, $\frac{1}{2}$ lb.; farina, 1 lb.; dry separately, as before, mix, and further add of sesquicarbonate of ammonia (in powder), 3 oz.; lastly, closely pack it in tinfoil.

3. (Green's.) Tartaric acid, 35 lbs.; sesquicarbonate of soda, 56 lbs.; potato flour, 1 cwt.; mix as before.

Uses, &c. Baking powder is chiefly employed as a substitute for yeast. 1 or 2 teaspoonfuls are mixed with the dry flour and other ingredients, which are then made into a dough, as quickly as possible, with cold water, and at once baked or boiled, as the case may be. By the addition of about $\frac{1}{2}$ dr. of turmeric powder to each pound of the mixture it is converted into egg powder. When intended to be kept for any length of time it should be preserved in bottles or tins, so as to prevent the absorption of moisture. We have discovered traces of arsenic in some of the baking powders of the shops, which we refer to common washerwoman's soda being used in their composition, instead of the pure carbonate or sesquicarbonate.

Powder, Basilic. *Syn.* RQYAL POWDER, CORNACHINI'S P.; PULVIS BASILICUS, P. CORNACHINI, L. *Prep.* From scammony, calomel, cream of tartar, and diaphoretic antimony, equal parts. This is the formula generally adopted for this compound, which has now long been omitted from the Pharmacopœias. It is still a favourite with many practitioners, as an alterative purgative, and vermifuge for children.—*Dose.* For a child, 2 to 8 grs.; for an adult, 5 to 20 grs. Compound powder of scammony is now generally sold for it.

Powder, Blaine's Distemper. The basis of

this preparation is the 'aurum musivum,' or bisulphuret of tin. (Dr. Paris.)

Powder, Blancmange. *Prep.* From sago meal, 1 lb.; essence of lemon, 15 drops; mace, 12 grs.; mix.

Powder, Bleaching. Chloride or hypochlorite of lime.

Powder Blue. See SMALT.

Powder, Bronze. See TIN (Bisulphide), BRONZING, &c.

Powder of Burnt Hartshorn. *Syn.* PULVIS CORNU CERVINI USTI, L. *Prep.* From pieces of hartshorn calcined to whiteness, and powdered. It consists principally of phosphate of lime.—*Dose.* 10 to 30 grs.; in rickets, &c.

Powder of Burnt Hartshorn with Opium. *Syn.* PULVIS OPIATUS, PULVIS CORNU USTI CUM OPIO, L. *Prep.* From powdered calcined hartshorn, 1 oz.; powdered opium and cochineal, of each, 1 dr.—*Dose.* 5 to 20 grs.

Powder, Capuchin. *Prep.* From powdered cevadilla, parsley seed, stavesacre, and tobacco, equal parts. *Used* to destroy pediculi.

Powder, Castillon's. *Prep.* From sago meal, salep, and gum tragacanth, of each 3 drs.; prepared oyster shells, 1 dr.; cochineal, q. s. to colour. Absorbent.—*Dose.* $\frac{1}{2}$ to 1 dr., boiled in milk; in diarrhoea, &c.

Powder of Cat'echu (Compound). *Syn.* PULVIS CATECHU COMPOSITUS (B. P., Ph. D.), L. *Prep.* 1. (Ph. D.) Take catechu and kino, of each, 2 oz.; cinnamon and nutmeg, of each, $\frac{1}{2}$ oz.; reduce each to a fine powder, mix, and keep the prepared powder in a well-stopped bottle. Aromatic and astringent.—*Dose.* $\frac{1}{4}$ dr. to 2 drs.; in various affections.

2. (B. P.) Pale catechu; kino, 2; rhazany, 2; cinnamon, 1; nutmeg, 1; mix.—*Dose.* 25 to 30 grs.

Powder of Chalk (Compound). *Syn.* PULVIS CRETÆ AROMATICUS (B. P.), PULVIS CRETÆ COMPOSITUS (Ph. L. E. & D.), P. CARBONATIS CALCIS COMP., L. *Prep.* 1. (Ph. L.) Prepared chalk, $\frac{1}{2}$ lb.; cinnamon, 4 oz.; tormentil and gum acacia, of each, 3 oz.; long pepper, $\frac{1}{2}$ oz.; rub them, separately, to a very fine powder, and mix them.

2. (Ph. E.) Prepared chalk, 4 oz.; cinnamon, in fine powder, $1\frac{1}{2}$ dr.; nutmeg, in fine powder, 1 dr.

3. (Ph. D.) Prepared chalk, 5 oz.; cinnamon, 2 $\frac{1}{2}$ oz.; gum, 2 oz.; nutmeg, $\frac{1}{2}$ oz.

4. (AROMATIC POWDER OF CHALK, B. P.) Chalk, 11; cinnamon, 4; nutmeg, 3; saffron, 3; cloves, $1\frac{1}{2}$; cardamom seed, 1; refined sugar, 25; all in powder; mix.—*Dose.* 30 to 60 grs.

Uses, &c. Aromatic, astringent, and antacid.—*Dose.* 10 to 30 grs.; in acidity, flatulence, heartburn, diarrhoea, &c. The following form is used by many wholesale houses:—Prepared chalk, 4 lbs.; powdered cassia, 2 lbs.; powdered calamus aromaticus, $\frac{1}{2}$ lb.; powdered gum, $1\frac{1}{2}$ lb.; long pepper, $\frac{1}{2}$ lb.

Powder of Chalk with Opium (Compound). *Syn.* PULVIS CRETÆ AROMATICUS CUM OPIO

(B. P.); OPIATED CHALK POWDER; PULVIS CRETÆ COMPOSITUS CUM OPIO (Ph. L.), PULVIS CRETÆ OPIATUS (Ph. E. & D.), L. *Prep.* 1. (Ph. L.) Compound chalk powder, 6½ oz.; powdered opium, 80 grs.

2. (Ph. E.) Compound chalk powder, 6 oz.; powdered opium, 80 grs.

3. (Ph. D.) Compound chalk powder, 4 oz. 7 drs.; opium, in fine powder, 1 dr.

4. (Wholesale.) Compound chalk powder, 21 oz.; powdered opium, ½ oz. Anodyne, antacid, and carminative.—*Dose.* 10 to 30 grs.; in the same cases as the preceding, than which it is more active. It has long been a favourite remedy in all cases of simple and even choleraic diarrhoea.

5. Aromatic powder of chalk (*see* POWDER OF CHALK (Compound), 4), 39; opium, in powder, 1; mix thoroughly, and pass through a sieve.—*Dose.* 10 to 40 grs.

Powder, Chalk Mixture. *Syn.* PULVIS PRO MIXTURA CRETÆ, L. *Prep.* (Beasley.) Powdered gum acacia, 5 oz.; prepared chalk, 4 oz.; white sugar, 3 oz.; oil of cinnamon, 1½ fl. dr.; mix. 40 grs. of this powder, triturated with 1 fl. oz. of water.

Powder, Chol'era (Saline). *Syn.* PULVIS SALINUS ANTICHOLOERICUS, L. *Prep.* 1. (Dr. O'Shaughnessy.) Carbonate of soda, 5 grs.; chloride of sodium, phosphate of soda, and sulphate of soda, of each, 10 grs. For a dose.

Powder of Cin'namon (Compound). *Syn.* AROMATIC POWDER; PULVIS CINNAMOMI COMPOSITUS (B. P., Ph. L.), PULVIS AROMATICUS (Ph. E.), L. *Prep.* 1. (Ph. L.) Cinnamon, 2 oz.; cardamoms, 1½ oz.; ginger, 1 oz.; long pepper, ½ oz.; rub them together so that a fine powder may be made.

2. (B. P., Ph. E.) Cinnamon, cardamom seeds, and ginger, equal parts; to be kept in a well-closed glass vessel.

3. (Ph. D.) Cinnamon and ginger, of each, 2 oz.; cardamom seeds (husked), and nutmegs, of each, 1 oz. Aromatic and carminative.—*Dose.* 10 to 30 grs. In the powder of the shops cassia is generally substituted for cinnamon.

Powder, Clarifying. Flake albumen. *See* ALBUMEN.

Powder, Cock'le. From the well-known shell-fish *Cardium edule* (Linn.), as oyster powder.

Powder, Colbatche's Specific. *Prep.* From solution of sesquichloride of iron and acetate of lead, of each, 4 oz.; mix, evaporate to dryness, powder the residuum, and preserve it from the air. Astringent and hæmstatic.—*Dose.* 3 to 8 grs.

Powder of Col'ocynth. *Syn.* PULVIS COLOCYNTHIDIS, L. That of the shops is generally prepared from the whole of the peeled fruit, with the seeds, instead of merely from the pulp, by which its activity is greatly lessened. A factitious article is also met with in trade, made by grinding byrrony root with about

twice its weight of colocynth seeds, and a very small quantity of gamboge.

Powder of Contrayer'va (Compound). *Syn.* PULVIS CONTRAYERVÆ COMPOSITUS, L. *Prep.* (Ph. L. 1824.) Powdered contrayer'va root, 5 oz.; prepared oyster shells, 1½ lb.; mix. A tonic absorbent or antacid.—*Dose.* 10 grs. to ½ dr., as required.

Powder, Corn.—*See* CORN SOLVENT (*page* 371), and WART POWDER (*below*).

Powder, Cosmetic. *Syn.* PULVIS COSMETICUS, L. *Prep.* (Ph. Hann. 1831.) Blanched sweet almonds and beans, of each, 18 oz.; orris root, 8 oz.; white Spanish soap, 6 oz.; spermaceti, 1½ oz.; dried carbonate of soda, 1 oz.; oils of lavender, bergamot, and lemon, of each, 6 drs.; mix, and beat them to a powder. *See* HAIR and HAND POWDER (*below*), PASTE (Almond), POWDERS (Scented), &c.

Powder of Crystal. From quartz, like POWDERED GLASS (*page* 574). Used to make fine glass; also for a dryer for paints, and sold under the name of 'diamond dust' for razor strops.

Powder, Cur'ry. *Syn.* INDIAN CURRY POWDER. The samples of this compound prepared by different houses vary so greatly from each other in the proportions of the ingredients, that it is difficult to regard any one as a standard. The following are therefore merely given as examples:—

Prep. 1. Corianders, 1 lb.; turmeric, ½ lb.; black pepper, ½ lb.; scorched mustard, ¼ lb.; ginger, 2 oz.; cumin seed, 1 oz.; capsicums, ¼ oz.; mace, ¼ oz.; (all in powder;) mix well.

2. Coriander seeds and black pepper, of each, 8 lbs.; turmeric and cumin seeds, of each, 4 lbs.; allspice, ½ lb.; mace, 1 oz.; (all in powder;) mix. This receipt is employed by an eminent wholesale house that does very largely in curry powder.

3. (*See page* 381.)

Used as a condiment and flavouring ingredient. The addition of a few heads of garlic gives it an increased zest for Indian veterans.

Powder, Cust'ard. *Prep.* From sago meal, 2 lbs.; powdered turmeric, ½ oz.; bitter-almond powder, cassia, and mace, of each, ½ dr.

Powder, Cyprus. From *Cladonia rangiferina* or reindeer moss. It has a very agreeable smell, and, being extremely retentive of odours, is much used as a basis for scent-powders, sachets, &c. The lichen known as the ragged hoary evernia also possesses nearly similar properties, and is often substituted for it. *See* POWDERS (Scented).

Powder, Disinfecting. *Syn.* PULVIS DISINFECTANS, L. *Prep.* (Keist.) Bisulphate of potassa, 41 parts; sugar of lead, 7 parts; binocide of manganese, 3 parts; reduce them separately to a fine powder, and, when wanted for use, mix a proper quantity in any suitable

vessel. For other formulæ, see DISINFECTING COMPOUNDS. The name is generally applied to hypochlorite of lime.

Powder, Dover's. *Syn.* PULVIS DOVERI, L. *Prep.* (Original formula.) Nitre and sulphate of potassa, of each, 4 oz.; melt them together in a red-hot crucible, reduce the cold fused matter to powder, and add powdered ipecacuanha, liquorice, and opium, of each, 1 oz. This is the formula adopted in the Paris Codex. COMPOUND IPECACUANHA POWDER is now sold under this name. (See *below*.)

Powder, Egg. See BAKING POWDER.

Powder, Emmenagogue. *Syn.* PULVIS EMMENAGOGUS, P. HEMATINUS, P. CONTRA AMENORRHEAM, L. *Prep.* 1. Saccharine carbonate of iron, 3 parts; powdered myrrh, ginger, and nutmeg, of each, 1 part; divide into $\frac{1}{2}$ -dr. papers. One for a dose, twice or thrice daily.

2. (Augustin.) Myrrh, 12 grs.; saffron, 3 grs.; oil of cloves, 1 drop. For a dose, as the last.

3. (Klein.) Calomel, 4 grs.; extract of yew, 10 grs.; powdered savine, 1 dr.; Quevenne's iron, $\frac{1}{2}$ dr.; loaf sugar, 2 drs. For 6 powders; as before.

Powder, Escharotic (Arsenical). *Syn.* PULVIS ESCHAROTICUS ARSENICALIS, L.; POUDRE DU FRÈRES COSME, Fr. *Prep.* 1. (Original formula.) From white arsenic, 12 grs.; burnt hartshorn, $\frac{1}{2}$ dr.; cinnabar, 1 dr.

2. (P. Cod.) Red sulphuret of mercury and powdered dragon's blood, of each, 2 parts; levigated arsenious acid, 1 part; carefully mixed together. See ARSENICAL CAUSTIC (page 304).

Powder of Extract of Colocyth (Compound). *Syn.* PULVIS EXTRACTI COLOCYNTHIDIS COMPOSITI, L. *Prep.* From compound extract of colocynth (Ph. L. 1836), dried by a gentle heat, and powdered.

Obs. This, like many other articles employed by lazy dispensers, does not represent the preparation for which it is used as a substitute; whilst, from its peculiar character, it is very open to sophistication, a practice, we regret to say, very general with certain druggists. Indeed, some of these parties make this article by simply throwing the ingredients of the extract into a pan along with a little water, and, when they have become soft, stirring them together with a spatula, after which they are 'siccated and powdered. This is then labelled by certain houses "Pulv. Ext. Coloc."—P. L., and sold to their unfortunate customers as such, although no such an extract has been in the Ph. L. since that of 1836.

Powder, Faynard's. The charcoal of beechwood, finely powdered. (Paris.) Used in piles, and as a styptic.

Powder, Fever. See ANTIMONIAL POWDER (*above*).

Powder of Flint. *Syn.* SILEX CONTRITUS (Ph. L.), L. *Prep.* As powdered glass. (See page 574.) It is ordered in the Ph. L. to be

employed, instead of magnesia, for the purpose of mechanically dividing the essential oils used in the preparation of distilled water. It is also used as an escharotic.

Powder, Fly. *Prep.* From white arsenic, 5 oz.; white sugar, 6 lbs.; rose pink, 2 oz.; mix, and put 6 drs. in each paper. Used to kill flies. It is poisonous, and should be employed with great caution, particularly where there are children.

Powder, Fulminating.

Powder, Fumigating. *Syn.* PULVIS FUMALIS, L. *Prep.* (Ph. Russ.) Amber, mastic, and olibanum, of each, 3 parts; storax, 2 parts; benzoin and labdanum, of each, 1 part; reduce them to coarse powder, and mix them well. See FUMIGATION.

Powder, Galls of (Compound). *Syn.* PULVIS GALLÆ COMPOSITUS, L. See ASTRINGENT POWDER.

Powder, Goelis's Antihæctic. *Prep.* From burnt hartshorn, powdered nutmeg, black pepper, and roasted laurel berries, of each, 1 part; liquorice powder, 3 parts.—Dose. $\frac{1}{2}$ to 1 dr.; in the hectic fever of scrofulous subjects.

Powder, Goulard. Effloresced sugar of lead. Poisonous.

Powder, Gray. Mercurial powder.

Powder, Gregory's. See COMPOUND RUBB POWDER (*below*).

Powder, Hæmostat'ic. *Syn.* PULVIS HÆMOSTATICUS, L. *Prep.* 1. (Guibourt.) Charcoal and gum arabic, of each, in powder, 1 part; powdered resin, 4 parts.

2. (Mialhe.) From powdered alum, gum tragacanth, and tannin, equal parts. Used to check local bleeding.

Powder, Hair. *Syn.* PULVIS PRO CRINE, L. Starch reduced to a very fine powder, and then scented according to the fancy of the artist; it is, lastly, passed through a gauze sieve. In its simple form, without any addition, it constitutes 'plain hair powder.' In other cases it is distinguished by the name of the substance added to perfume it. Thus, we have 'rose hair powder,' 'violet h. p.,' &c. Potato farina, well triturated, is now commonly used for hair powder. Amongst the lower classes, the contents of the 'flour dredger' of the kitchen are frequently misappropriated to this purpose. See SCENTED POWDERS (*below*).

Powder, Hand. *Prep.* From almond powder, 1 lb.; powdered cuttle-fish bone and white soap, of each, 4 oz.; orris powder, 1 oz.; mix. Used to clean the hands, and to render them soft and white. See COSMETIC POWDER.

Powder, Helvetius's. *Syn.* PULVIS HELVETII, L. A mixture of powdered alum and dragon's blood. (Dr. Paris.)

Powder, Herrenschwand's Specific. See PATENT MEDICINES.

Powder, Hiera Picra. Powder of aloes with canella (see *above*).

Powder, Hufeland's. *Syn.* HUFELAND'S

QUINQUINA FACTICE, PULVIS CINCHONÆ FACTITUS, P. SALICIS COMPOSITUS, L. *Prep.* From bennet (the herb), calamus aromaticus, chestnut bark, gentian root, and willow bark, equal parts; reduced to powder.

Powder, Hunter's. See WART POWDER (*below*).

Powder, Hunt's Breakfast. See page 260.

Powder of Ipecacuanha. (Compound). *Syn.* DOVER'S POWDER, COMPOUND POWDER OF IPECACUANHA WITH OPIUM; PULVIS DOVERI, PULVIS IPECACUANHÆ COMPOSITUS (B. P., Ph. L. E. & D.), L.; POUDRE D'IPECACUANHA ET D'OPIMUM, Fr. *Prep.* 1. B. P., Ph. L.) Ipecacuanha and opium, of each, in fine powder, 1 dr.; sulphate of potassa, in fine powder, 1 oz.; mix them (thoroughly). The Edin. and Dublin Formulæ are similar.

2. (P. Cod.) Nitre and sulphate of potassa, of each, 4 oz.; ipecacuanha, liquorice root, and hard extract of opium, of each, 1 oz. This closely resembles the original formula.

3. (Wholesale.) From powdered ipecacuanha and opium, of each, 1 lb.; powdered sulphate of potassa, 8 lbs. *Uses, &c.* 'Dover's powder' is a powerful and valuable sudorific.—*Dose.* 5 to 15 or 20 grs., followed by warm diluents; in inflammatory affections, rheumatisms, colds, &c.

Powder, Itch. *Syn.* PULVIS ANTIPSORICUS, L. *Prep.* 1. Sulphur and potato farina, of each, $\frac{1}{2}$ lb.; essence of bergamot, $\frac{1}{4}$ oz.; mix.

2. (Poudre de Pihorel.) A mixture of finely pulverised sulphuret of calcium and farina, in nearly equal quantities. *Used* either as a dusting powder or mixed with a little oil or fat, and rubbed into the affected part.

Powder of Jal'ap (Compound). *Syn.* PULVIS JALAPÆ COMPOSITUS (B. P., Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Jalap, 3 oz.; bitartrate of potassa, 6 oz.; ginger, 2 drs.; rub them separately into fine powder, then mix them.

2. (Ph. E.) As the last, omitting the ginger.

3. (Ph. D.) Jalap, 2 oz.; bitartrate of potassa, 3 $\frac{1}{2}$ oz.; ginger, $\frac{1}{2}$ oz.; (all in fine powder;) mix by careful trituration.—*Dose.* 20 to 60 grs.; as a purgative in habitual costiveness, dropsies, &c.; also in worms, the tumid bellies of children, &c.

4. (B. P.) Jalap, in powder, 5; acid tartrate of potash, 9; ginger, in powder, 1; mix.—*Dose.* 20 to 60 grs.

5. (PULVIS LENTIVUS; SACRE ORANGÉ PURGATIF.) From refined sugar, $\frac{1}{2}$ lb.; jalap and cream of tartar, of each, 2 oz.; oil of orange peel, $\frac{1}{4}$ oz. A popular purgative on the Continent.—*Dose.* 1 to 3 drs.

Powder, James's. *Syn.* PULVIS JACOBI, P. FERRIFUGUS JACOBI, L. The antimonial powder, or compound powder of antimony, of the Pharmacopœias (see *above*) is the preparation

which usually passes under this name; but the true James's powder is a nostrum the pretended secret of the preparation of which is claimed to be possessed by only two parties in the kingdom. The patent specification of the once celebrated Dr. James runs as follows:—

"Take of antimony, calcine it with a continued protracted heat, in a flat, unglazed earthen vessel, adding to it, from time to time, a sufficient quantity of any animal oil and salt, well dephlegmated; then boil it in melted nitre for a considerable time, and separate the powder from the nitre by dissolving it in water." On this it has been remarked that it yields a product totally different from that which Dr. James and his successors have sold under the name, and he has hence been charged with concealing the real formula for his powder, and publishing a false one in its stead.

According to Dr. Robinson, the original formula for this nostrum, and that still adopted by the vendors of the proprietary article at the present day, is—Tartarised antimony, 1 part; prepared burnt hartshorn and calx of antimony, of each, 5 parts; carefully mixed together, and divided into 21-gr. powders. ('Phil. Journ. Pharm.,' vi, 282.)

From analyses recently made of three specimens of James's powder ('Newberry's,' 'Butler's,' and a sample of 60 years old obtained by Mr. Squire), it appears that antimonious acid was present in different proportions, from about 45 $\frac{1}{2}$ to 33 $\frac{1}{2}$, the amount being greatest in the old specimen; teroxide of antimony was also present to the extent of from 9 $\frac{1}{2}$ to less than 1 $\frac{1}{2}$, the greatest quantity being again in the old preparation; the remainder in each specimen consisted chiefly of phosphate of lime; no trace of tartaric acid was discoverable in any of the samples.

Perhaps no nostrum ever received such extensive patronage from the faculty as James's powder. Dr. James himself was remarkably successful in its use; but whether his success depended upon his powder or the mercurials and bark which he commonly employed at the same time, is still undetermined.

Powder of Kino (Compound). *Syn.* PULVIS KINO COMPOSITUS (B. P., Ph. L.), L. *Prep.* (B. P., Ph. L.) Kino, 15 drs.; cinnamon, 4 drs.; dried opium, 1 dr.; reduce them separately to fine powder, and then mix them.—*Dose.* 5 to 20 grs.; in diarrhoea, pyrosis, &c.

Powder, Lausanne. *Prep.* From nitre, 1 $\frac{1}{2}$ dr.; carbonate of magnesia, bitartrate of potassa, precipitated sulphur, and oleo-saccharum of peppermint, of each, 4 drs.; sugar of milk, 1 oz. Lentive and antidiysenteric.

Powder, Laxative. See SPECIES.

Powder of Liquorice (Compound). *Syn.* PULVIS GLYCYRRHIZÆ COMPOSITUS, L. *Prep.* (Ph. Bor.) Liquorice root and senna leaves, of each, 6 oz.; fennel seed and milk of sulphur (pure), of each, 3 oz.; white sugar, 18 oz.; (all in fine powder;) mix. Pectoral and laxative.

Powder of Magnesia and Rhu'barb. See COMPOUND RHUBARB POWDER (*below*).

Powder, Martin's Can'cer. An American nostrum, composed of the powdered stems of the *Orobanché Virginiana* (Linn.), combined with a very small quantity of arsenious acid. It is used as a sprinkle for open cancers and cancerous sores.

Powder, Mercu'rial. *Syn.* GREY POWDER (HYDRARGYRUM CUM CRETÂ, B. P.), MERCURY WITH CHALK. *Prep.* 1. (B. P.) Mercury, 1; prepared chalk, 2; triturate till the globules disappear.—*Dose.* 3 to 8 grs.

2. Mercury, 3 oz.; powdered resin, $\frac{3}{4}$ oz.; prepared chalk, 5 oz.; rectified spirit, q. s.; make a paste with the resin and a small quantity of the spirit; add the mercury, which may be extinguished in a short time; then the chalk and alcohol, gradually, so as to keep up the pasty consistence; lastly, add sufficient spirit to dissolve out the resin, wash the powder on a filter, and dry it. Rectified oil of turpentine may be substituted for the spirit.

Powder, Milk. (See page 914.)

Powder, Morison's Ape'riant. See PATENT MEDICINES.

Powder of Mush'room. *Syn.* PULVIS AGARICI, P. A. ESCULENTI, L. From edible mushrooms, dried by a gentle heat, and then powdered along with a little white pepper, cloves, and mace. Some cayenne is frequently added.

Powder of Mus'sel. From the *Mytilus edulis* (Linn.), or common mussel, in the same way as OYSTER POWDER.

Powder of Myrrh (Compound). *Syn.* PULVIS Æ MYRRHÆ COMPOSITUS, L. *Prep.* (Ph. L. 1788.) Myrrh, dried savine, dried rue, and Russian castor, equal parts, rubbed to powder, and then well mixed. Emmenagogue and antispasmodic.—*Dose.* 12 to 30 grs.

Powder, Nur'sery. See VIOLET POWDER (*below*).

Powder, O'piated. Powder of chalk with opium.

Powder of Oys'ter. *Syn.* PULVIS OSTREÆ, L. *Prep.* From the common oyster (*Ostrea edulis*—Linn.), pulped through a sieve, made into a paste with wheaten flour and a little salt, and then rolled out into thin pieces and dried; these are reduced to powder, sifted, and packed in well-corked bottles. *Used* to make sauce; about 1 oz., to water, 1 pint. Other shell-fish are treated in the same way.

Powder, Pea. *Syn.* PEA FLOUR; FARINA PISORUM, L. *Prep.* From peas, in the usual manner. *Used* to make extemporaneous pea-soup.

Powder, Pearl. *Prep.* From pure pearl white and French chalk (scraped fine by Dutch rushes), equal parts; triturated together. Some makers add more French chalk. *Used* as a skin cosmetic. This mixture is preferable to pearl white alone, from being more adhesive.

Powder, Pease. *Prep.* From dried mint and sage, of each, 4 oz.; celery seed and white pepper, of each, $\frac{1}{2}$ oz.; turmeric powder, $\frac{1}{4}$ oz.;

reduced to fine powder. *Used* as a condiment and kitchen spice.

Powder, Pec'toral. See POWDER OF LIQUORICE, &c.

Powder, Piles. *Syn.* PULVIS ANTI-HÆMORRHOIDALIS, P. HÆMORRHOIDALIS, L. *Prep.* 1. (Fr. Hosp.) Precipitated sulphur, 3 oz.; cream of tartar and black pepper, of each, 1 oz.; oil of cubebs, $\frac{1}{2}$ dr.—*Dose.* A teaspoonful, in milk or honey, thrice a day.

2. (External).—*a.* From Aleppo galls, in very fine powder, 2 oz.; opium, in fine powder, 1 dr. A pinch to be applied occasionally.

b. From sesquioxide of iron, 1 oz.; powdered acetate of lead, $\frac{1}{2}$ dr. As the last.

Powder, Plate. *Syn.* PULVIS PRO ARGENTO, L. *Prep.* 1. Jeweller's rouge, $\frac{1}{4}$ lb.; prepared chalk or levigated burnt hartshorn, $\frac{1}{4}$ lb.; mix.

2. Levigated putty powder, $\frac{1}{4}$ lb.; burnt hartshorn, $\frac{1}{2}$ lb.; prepared chalk, 1 lb.; rose pink, 1 oz.

3. (MERCURIAL.) From quicksilver with chalk, 1 oz.; prepared chalk, 11 oz.; mix. *Used* to clean and polish plate. See PLATE.

Powder, Plate Boiling. *Prep.* From cream of tartar, common salt and alum, equal parts. A little of this powder, added to the water in which plate is boiled, gives to it a silvery whiteness.

Powder, Plummer's Al'terative. See ANTIMONIAL ETHIOPS.

Powder, Poul'tice. *Syn.* PULVIS PRO CATAPLASMATE (Ph. D. 1826), L. *Prep.* From linseed meal, 1 part; oatmeal, 2 parts; mixed together.

Powder, Rat. See RATS.

Powder of Rhu'barb (Compound). *Syn.* GREGORY'S MIXTURE, GREGORY'S POWDER; PULVIS RHEI COMPOSITUS (B. P., Ph. B. & D.), L. *Prep.* 1. (Ph. E.) Calcined magnesia, 1 lb.; rhubarb, 4 oz.; ginger 2 oz.; (all in fine powder;) mix, and preserve it from the air.

2. (B. P., Ph. D.) Calcined magnesia, 6 oz.; rhubarb, 2 oz.; ginger, 1 oz.

3. Calcined magnesia, 8 oz.; rhubarb, 3 oz.; chamomile, 2 oz.; ginger, 1 oz.

Obs. An excellent stómachic, antacid, and laxative.—*Dose.* 20 grs. to $\frac{1}{2}$ dr. Some druggists substitute the heavy carbonate for the calcined magnesia ordered above, but this alters the nature of the preparation, and requires the dose to be increased. Heavy calcined magnesia may, however, be employed with advantage.

Powder, Sach'et. See SCENTED POWDERS.

Powder, Saline' (Compound). *Syn.* PULVIS SALINUS COMPOSITUS (Ph. E.), L. *Prep.* (Ph. E.) Pure chloride of sodium and sulphate of magnesia, of each, 4 oz.; sulphate of potash, 3 oz.; each separately dried by a gentle heat, and pulverised, then triturated together, and preserved in well-closed vessels. An excellent saline purgative.—*Dose.* 2 to 6 drs., in $\frac{1}{2}$ pint of water or table-beer, in the morning, fasting.

Powder of Scammony (Compound). *Syn.* PULVIS SCAMMONII COMPOSITUS (B. P., Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Scammony and hard extract of jalap, of each, 2 oz.; ginger, $\frac{1}{2}$ oz.; rub them separately to a very fine powder, and then mix them.—*Dose.* 5 to 15 grs.

2. (Ph. E.) Scammony and bitartrate of potash, of each, in very fine powder, equal parts.—*Dose.* 7 to 20 grs.

3. (Ph. D.) Scammony, in fine powder, 1 oz.; compound powder of jalap, 3 oz.; mix.—*Dose.* 10 to 30 grs.

4. (B. P.) Scammony, 4; jalap, 3; ginger, 1; mix, and reduce to fine powder.—*Dose.* 10 to 20 grs.

Obs. The above are favourite cathartics in worms, especially for children. They are commonly sold for basilio powder. (See above.)

Powder of Scammony with Cal'omel. *Syn.* PULVIS SCAMMONII CUM CALOMELANE, L. *Prep.* From scammony, $\frac{1}{2}$ oz.; calomel and white sugar, of each, 2 drs. An excellent vermifuge for children.—*Dose.* For an adult, 5 to 20 grs.; for a child, 2 to 8 grs. Sold for basilio powder, to which it approaches nearer in composition than the preceding.

Powder, Schmidt's Parturifacient. *Syn.* SCHMIDT'S POUDRE OCTYQUE, Fr. *Prep.* From powdered ergot of rye, borax, and oleo-saccharum of camomile, of each, 8 grs.; powdered sugar, q. s. For a dose; to be repeated every quarter of an hour, until some effect is produced.

Powder of Sen'na (Compound). *Syn.* PULVIS SENNÆ COMPOSITUS, L. *Prep.* (Ph. L. 1824.) Senna and bitartrate of potassa, of each, 2 oz.; scammony, $\frac{1}{2}$ oz.; ginger, 2 drs.; all in fine powder; mix.—*Dose.* 20 to 30 grs.; or more; as a purgative or anthelmintic.

Powder of Senna (Battley's Green). *Syn.* PULVIS SENNÆ VIRIDIS, L. *Prep.* From senna leaves, dried and heated until they turn yellow, then powdered along with a little (blue) charcoal, to give a green colour.

Powder, Sil'vering. *Prep.* 1. Silver dust (fine), 20 grs.; alum, 30 grs.; common salt, 1 dr.; cream of tartar, 3 drs.; rub them together to a fine powder.

2. As the last, but substituting 35 grs. of nitrate of silver for the silver dust.

3. Chloride of silver is dissolved in a solution of hyposulphite of soda, and the solution made into a paste with levigated burnt hartshorn or bone dust; this is next dried, and powdered.

4. Silver dust, 1 oz.; common salt and sal ammoniac, of each, 4 oz.; corrosive sublimate, $\frac{1}{4}$ oz.

Obs. The above powders, made into a paste with a little water, are used to silver dial-plates, statuettes, and other articles in copper, previously well cleaned, by friction. The best silver powder for the purpose is that precipitated from its nitric solution by means of a copper plate. When the product of the last

formula is used, the articles should be afterwards made red hot, and polished.

Powder of Soap. *Syn.* SAPO CONTRITUS, PULVIS SAPONIS, L. Castile soap, sliced or cut small, dried by exposure to a warm atmosphere, or by a very gentle heat, and then powdered. Used in dispensing; also as a hand, shaving, and tooth powder. As a cosmetic, it may be scented at will.

Powder of Sponge. *Syn.* PULVIS SPONGIÆ, P. SPONGIÆ USTÆ, L. *Prep.* Let sponge, cut into small pieces, be beaten so as to free it from sand or stones; then burn it in a covered iron vessel, until it becomes black and friable; finally, reduce it to powder. Deobstruent.—*Dose.* $\frac{1}{2}$ to 3 drs.; in glandular indurations and enlargements, &c. It should be of a brownish-black colour; if over burnt, its efficacy is destroyed.

Powder of Squills. *Syn.* PULVIS SCILLÆ, L. *Prep.* Remove the membranous integuments from the bulb of the squill, cut it into thin slices, and dry it at a heat between 90 and 100° Fahr.; next reduce it to powder, and keep it in well-stopped bottles.

Powder, Sternutatory. See SNUFFS (Medicated).

Powder, Styptic. See ASTRINGENT POWDER, FAYNARD'S P., &c.

Powder of Trag'acanth (Compound). *Syn.* PULVIS TRAGACANTHÆ COMPOSITUS (B. P., Ph. L. & E.), L. *Prep.* 1. (Ph. L.) Gum tragacanth, gum acacia, and starch, of each, in fine powder, $\frac{1}{2}$ oz.; powdered white sugar, 3 oz. The Edinburgh formula is similar. Demulcent.—*Dose.* $\frac{1}{2}$ dr. to 2 drs., in water or any simple liquid; in hoarseness and catarrhs, combined with squills and henbane, to allay irritation; in dysentery, combined with ipecacuanha; in gonorrhœa, strangury, &c., combined with acetate of potass or nitre.

2. (B. P.) Tragacanth, in powder, 1; gum arabic, in powder, 1; starch, in powder, 1; refined sugar, in powder, 3; rub well together.—*Dose.* 10 to 60 grs.

Powder, Violet. *Syn.* NURSEY POWDER, SKIN P. This is simply starch reduced to a very fine powder, and scented with orris powder or essence of violets. The best kinds are also perfumed with a little musk or ambergris, and are now generally made with potato farina. The commoner sort is only scented with a little essence, or 'bergamot' or 'essence of lemon. 'Plain violet powder' is, of course, unscented.

Prep. 1. Powdered starch, 28 lbs.; powdered orris root, 1 lb.; essence of ambergris and essence of bergamot, of each, $\frac{1}{2}$ oz.; oil of rhodium, $\frac{1}{2}$ dr.; mix, and pass the powder through a sieve.

2. Powdered starch, 14 lbs.; essence of bergamot, $\frac{1}{2}$ oz.; oil of cloves, $\frac{1}{4}$ oz.; as last. Used as a dusting powder in excoariations, &c. See COSMETIC POWDERS (*below*).

Powder, Ward's Sweating. Resembles DOVER'S POWDER.

Powder, Wart. *Syn.* CORN POWDER, COS-

METIC CAUSTIC, &c. *Prep.* 1. Ivy leaves ground to powder. A pinch is applied with a rag, the part being first moistened with strong vinegar. *Useful* for soft corns and warts.

2. (Hunter's.) From savine and verdigris, equal parts. See CORN SOLVENT.

Powder, Warwick's (Earl of). *Syn.* PULVIS COMITIS WARWICENSIS, L. *Prep.* From scammony, prepared with the fumes of sulphur, 2 oz.; diaphoretic antimony, 1 oz.; cream of tartar, $\frac{1}{2}$ oz.—*Dose.* 15 to 30 grs.

Obs. This is a modification of CORNACHINI'S POWDER. It is represented in the present Pharmacopœias by COMPOUND SCAMMONY POWDER. "Cornachini wrote a whole book about his powder, the proportions of the ingredients of which he varied according to circumstances." ('Med. Lex.')

Powder, Washing. The numerous compounds vended under this name have for their basis the soda-ash of commerce, blended with common Scotch soda in variable proportions. The best of them consist either wholly or chiefly of the first of these substances. The alkaline matter is reduced to coarse powder, and stirred up with liquid size, or with a decoction of linseed, Irish moss, or British gum, and is then dried, and again crushed, or powdered, and at once put into the packages, in which it is rammed tight, and covered up immediately. The object aimed at by the manufacturer is to keep his commodity from the air as much as possible, because exposure renders it less caustic, and consequently, less detergent.

POWDERS. The following preparations have been placed under this head instead of under 'POWDER,' because some are invariably spoken of in the plural number, and the others may be conveniently noticed in classes or groups.

Powders, Efferves'cing. *Prep.* 1. (PULVERES EFFERVESCENTES—Ph. E.) Take of tartaric acid, 1 oz.; bicarbonate of soda, 1 oz. 54 grs. (534 grs.), or bicarbonate of potassa, 1 oz. 2 drs. 40 grs. (640 grs.); reduce the acid and either bicarbonate separately to fine powder, divide each of these into 16 powders, and preserve the acid and alkaline powders in separate papers of different colours.

2. (PULVERES EFFERVESCENTES CITRATI—Ph. D.) Take of citric acid (crystallised), 9 drs.; bicarbonate of soda, 11 drs., or bicarbonate of potassa, 13 drs.; proceed as last, dividing each into 18 parts.

3. (PULVERES EFFERVESCENTES TARTARIZATI—Ph. D.) Take of tartaric acid (in crystals), 10 drs.; bicarbonate of soda, 11 drs., or bicarbonate of potassa, 13 drs.; reduce them to powder, and divide them into 18 parts, as before. (See *below*.)

Powders, Gin'ger Beer. *Syn.* PULVERES EFFERVESCENTES CUM ZINGIBERE, L. *Prep.* 1. Powdered white sugar, 1 to 2 drs.; bicarbonate of soda, 26 grs.; finest powdered Jamaica ginger, 6 grs.; essence of lemon, 1

drop; mix, and wrap it in blue paper. In the white paper put of powdered tartaric acid, 35 grs., or of powdered citric acid, 30 grs.

2. Finest Jamaica ginger, 1 dr.; bicarbonate of soda, 5 drs.; white sugar, 16 drs.; essence of lemon, 6 or 8 drops; mix, and divide it between 12 papers (blue). For the white papers, divide tartaric acid, 6 drs., in the same way. By taking the drachms as ounces, the quantity will be sufficient for 8 dozen. For *use*, dissolve one of each colour separately in somewhat less than half a glass of water, mix the two, and drink the mixture whilst effervescing.

3. (In one bottle.)—*a.* The sugar and the saline ingredients are separately dried by a very gentle heat, then mixed in a dry room with the ginger and essence of lemon, and at once put into bottles.

b. By adding to the 'acidulated kali,' noticed at page 667, about 1-16th of its weight of the finest powdered Jamaica ginger (*i. e.* $\frac{1}{2}$ dr. to each oz.; 1 oz. to each lb.) at the time of mixing the ingredients together. A dessert-spoonful, thrown into a tumbler two thirds filled with cold water, produces an excellent glass of ginger beer.

Powders, Ink. The article usually sold under this name is noticed under INK. Another formula, which we have adopted with considerable success, is as follows:—Good black ink, 3 pints, lump sugar, $1\frac{1}{2}$ oz., and gum arabic, $\frac{1}{2}$ oz., are put into a clean iron pan, and evaporated by the heat of boiling water, with occasional stirring, to dryness; the dried mass is reduced to powder, and divided into 12 parts, which are enveloped in either tin-foil or glazed paper, and kept dry. One of these papers dissolved in $\frac{1}{4}$ pint of hot water forms that quantity of excellent black ink, without sediment, and which answers well with the copying press.

Powders, Lem'onade. *Syn.* LEMON SHERBET; LIMONADUM SICCTUM, PULVIS PRO LIMONADO, L. *Prep.* 1. Powdered citric or tartaric acid, 12 grs.; powdered white sugar, $\frac{1}{2}$ oz.; essence of lemon, 1 drop (or a little of the yellow peel of a lemon rubbed off on a piece of sugar); mix. For one glass.

2. White sugar, 4 lbs.; citric or tartaric acid, $1\frac{1}{2}$ oz.; essence of lemon, $\frac{1}{2}$ oz.; mix well, and preserve it in a bottle for use. 1 to 2 dessert-spoonfuls make a glass of lemonade. It is also put up in papers, containing about 24 drs. each.

3. (EFFERVESCING.)—*a.* For the blue papers, take of powdered white sugar, 1 lb.; bicarbonate of soda, $\frac{1}{4}$ lb.; essence of lemon, $1\frac{1}{2}$ dr.; mix, and divide it between 6 dozen papers. Next divide tartaric or citric acid, 5 oz., between 6 dozen white papers. Or the two may be kept in bulk, in separate bottles.

b. (In one bottle.) As 'ACIDULATED KALI.' Some makers slightly increase the quantities of acid and essence of lemon there ordered.

Powders, Pol'ishing. *Prep.* 1. (For brass

and copper.)—*a.* From rotten stone, 3 oz.; powdered soap, 1 oz.

b. From rotten stone, 7 oz.; powdered oxalic acid, 1 oz. Both are used with a little water. See BRASS PASTE.

2. (For gold.) Jeweller's rouge. See SESQUIOXIDE OF IRON.

3. (For ivory.) Pumice stone and putty powder.

4. (For plate.) See PLATE and PLATE POWDER.

5. (For silver.) As the last.

Powders, Scented. *Prep.* 1. COSMETIC POWDERS.—*a.* (POUDRE DE CHIPRE.) Macerate oak moss in running water for 2 or 3 days, then dry, and powder it. *Used* as a basis for other powders, on account of its being highly retentive of odours. Reindeer moss and ragged hoary evernia are also used for the same purpose. See CYPRUS POWDER (*above*).

b. (POUDRE DE CHIPRE DE MONTPELIER.) From poudre de chipre, 2 lbs.; musk, 30 grs.; civet, 20 grs.; (the last two powdered by means of a little sugar); cloves, $\frac{1}{2}$ oz.

c. (POUDRE DE FLEURS D'ORANGES.) From starch or cyprus powder, 25 lbs.; orange flowers, 1 lb.; mixed in a covered chest, and stirred twice or thrice daily; the process being repeated, with fresh flowers, a second and a third time. Or, the plain powder is scented by the addition of a little neroli or essence of petit grain.

d. (POUDRE DE FRANGIPANNI.) From poudre de fleurs d'oranges and poudre de chipre, of each, 6 lbs.; essence of ambergris, 1 oz.; civet (powdered with sugar), $\frac{1}{2}$ dr. Ash-gray colour.

e. (POUDRE DE JASMINE.) As POUDRE DE FLEURS D'ORANGES, but using jasmin flowers.

f. (POUDRE À LA MARÉCHALE.) From poudre de chipre, 2 lbs.; starch powder, 1 lb.; calamus aromaticus, cloves, and cyperus perennis or rotundus, of each, 2 oz. Or, starch powder, 28 lbs.; powdered cloves, $\frac{1}{2}$ lb.; powdered orris root, $\frac{1}{2}$ lb.; essence of ambergris, 2 drs.

g. (POUDRE À LA MOUSSELINE.) From orris root, 1 lb.; coriander seed, 6 oz.; mace and violet ebony, of each, 2 oz.; musk seed, cassia, cloves, and sandal wood, of each, 1 oz.

h. (POUDRE DE JONQUELLE.) From jonquils, as POUDRE DE JASMINE.

i. (POUDRE À L'ÉCILLET.) From plain powder, 2 lbs.; orris root and dried red rose leaves, of each, 1 lb.; cloves and musk seed, of each, 4 oz.; essence of bergamot and essence de petit grain, of each, $\frac{1}{2}$ dr.

k. (POUDRE DE ROSES COMMUNES.) From pale roses, as POUDRE DE FLEURS D'ORANGES.

l. (POUDRE DE ROSES MUSQUÉES.) From musk roses, as the last.

m. (POUDRE À LA VANILLE.) From poudre de chipre or cyprus, 3 lbs.; vanilla, powdered by means of sugar, 2 drs.; oil of cloves and essence of ambergris, of each, 20 drops.

n. (POUDRE À LA VIOLETTE.) See VIOLET POWDER (*above*).

The above are used as cosmetic powders for the skin and hair; also, but less frequently, for sachets, drawers, &c.

2. SACHET POWDER.—*a.* From orris root, 2 oz.; cassia, $\frac{1}{2}$ oz.; cloves, 1 oz.; yellow sandal wood, $\frac{1}{4}$ oz.; oils of lavender and bergamot, of each, 1 dr.; otto of roses, 20 drops; musk and ambergris, of each, rubbed with a little sugar, 6 grs.; reduce the dry ingredients to coarse powder, mix them, and add the oils.

b. From corianders, orris root, rose leaves, and calamus aromaticus, of each, 4 oz.; lavender flowers, 8 oz.; rhodium wood, 1 dr.; musk, 20 grs.

c. From corianders, orris, calamus aromaticus, and red roses (dried), of each, 1 oz.; lavender flowers, 2 oz.; mace and cloves, of each, 1 dr.; essential oil of almonds, 10 drops.

d. As last, but substituting musk, 5 grs., for the oil of almonds.

e. From patchouli, 8 oz.; lavender flowers, (lightly dried), 3 oz.; orris root, 2 oz.; cloves, 1 oz.; essence of bergamot, 1 dr.; essences of ambergris and musk, of each, $\frac{1}{2}$ dr.

These are used, along with cotton wool, to fill scent bags, cassolettes, &c.; and as scent powders for boxes, drawers, and the like. The scent is added to the dry ingredients, separately reduced to powder, and the whole is then passed through a fine sieve, to ensure perfect admixture.

3. PARFUM POUR LES AUTRES POWDRES. From poudre d'ambrette, 12 lbs.; civette, $\frac{1}{2}$ oz.; musk, 1 dr.; reduce the last two to powder by grinding them with some dry lump sugar, then mix the whole together and pass it through a sieve. *Used* to perfume hair powder, sachets, &c.

Powders, Seidlitz. *Syn.* PULVERES EFFERVESCENTES APERIENTES, L. *Prep.* 1. Potassio-tartrate of soda (Rochelle salt) 2 drs.; bicarbonate of soda, 40 grs.; mix, and put it in a blue paper; tartaric acid, 35 grs., to be put in a white paper. For about $\frac{1}{2}$ pint of water. Laxative.

2. (In one bottle.) From potassio-tartrate of soda, 12 oz.; bicarbonate of do., 4 oz.; tartaric acid, $3\frac{1}{2}$ oz.; white sugar, 1 lb.; (all in fine powder); dry each separately by a gentle heat, add of essence of lemon, $\frac{1}{2}$ dr., mix well, pass the mixture through a sieve, and put it at once into clean dry bottles.—*Dose.* A dessert-spoonful, or more, to a tumblerful of water.

Obs. The above mixtures, though now universally sold as Seidlitz powder, do not, when dissolved, exactly resemble the natural water, which contains carbonates, sulphates, and chlorides of calcium and magnesium. However, the factitious article is equally effective, and much more agreeable.

Powders, Sherbet. These are made of the same materials as lemonade powders, the flavouring ingredient being varied to suit the particular case.

Powders, So'da-water. *Syn.* EFFERVESCING POWDERS, E. SALINE P., SODAIC P., AERATED SODA P.; PULVERES EFFERVESCENTES, L. *Prep.* 1. From bicarbonate of soda, 30 grs., in each blue paper; tartaric acid, 25 grs. (or citric acid, 24 grs.), in each white paper. One of each is dissolved separately in about $\frac{1}{2}$ a glassful of water, and the two solutions mixed, and drank immediately. A cooling, wholesome summer beverage, but it should not be indulged in to excess.

2. (Chalybeated.) By adding 1 gr. of dried protosulphate of iron to each paper of acid. Tonic.

3. (Midgeley's.) Made by adding $\frac{1}{2}$ gr. of tartarised antimony to each paper of acid. Refrigerant and diaphoretic. For the Ph. formulæ see EFFERVESCING POWDERS (*above*).

Powders, Soup. See CURRY POWDER, PEASE P., SPICE, &c.

Powders, Spruce Beer. *Syn.* PULVERES EFFERVESCENTES CUM ABITE, L. *Prep.* As ginger-beer powders, but substituting essence of spruce, 3 to 6 drops, for the powdered ginger.

Powders, Tooth. *Syn.* PULVIS DENTIFRICII, L. The general principles which should be kept in view in the selection of the materials, and in the preparation of dentifrices, have been already fully noticed (see page 399), and need not, therefore, be repeated here. Care must be taken that all the dry ingredients be finely pulverised, and that the harder and gritty ones be reduced to the state of an impalpable powder, either by levigation or elutriation. The mixture of the ingredients must also be complete. This is the most readily effected by stirring them well together until they form an apparently homogeneous powder, and then passing this powder through a very fine sieve. Those which contain volatile substances should be preserved in closely corked wide-mouth bottles, and those which contain acidulous or gritty matter should not be frequently employed. The selection of the tooth brush likewise deserves attention. It should be sufficiently stiff to effect its purpose completely; but, at the same time, it should be so formed as not to cause irritation or injury to the gums during its use.

Prep. 1. Cuttle-fish bone and prepared chalk, of each, 2 oz.; oil of cloves, 20 drops. This may be perfumed at will, and medicated by any of the substances referred to under DENTIFRICES.

2. To the last add of powdered Castile soap, 2 oz.

3. Prepared chalk, 12 oz.; cuttle-fish bone, 8 oz.; orris root, 4 oz.; dragon's blood, $1\frac{1}{2}$ oz.; oils of cloves and cassia, of each, $\frac{1}{2}$ dr.

4. Prepared chalk, 1 lb.; pumice-stone, in impalpable powder, $\frac{1}{2}$ lb.; orris root, 2 oz.; pure rouge, $\frac{1}{2}$ oz.; neroli, $\frac{1}{2}$ dr.

5. Yellow cinchona bark and myrrh, of each, $\frac{1}{2}$ oz.; recently burnt charcoal, 3 oz.; cloves, 1 dr.

6. Pumice-stone, red coral, and powdered rhatany root, of each, 2 oz.; orris root, $\frac{1}{2}$ oz.; essence of vanilla, $\frac{1}{2}$ dr.

7. (AROMATIC TOOTH POWDER.) From cuttle-fish bone, 4 oz.; calamus aromaticus, 2 oz.; powdered Castile soap, 1 oz.; oil of cloves, $\frac{1}{2}$ dr.

8. (ASIATIC DENTIFRICE.) From prepared red coral, $8\frac{1}{2}$ lbs.; Venetian red, $\frac{1}{2}$ lb.; prepared chalk and pumice-stone, of each, $1\frac{1}{2}$ lb.; China musk, 30 grs.

9. (Cadet's.) From lump sugar and charcoal, of each, 1 oz.; Peruvian bark, $\frac{1}{2}$ oz.; cream of tartar, $\frac{1}{2}$ oz.; cinnamon, $\frac{1}{2}$ dr.

10. (Camphorated.) See CAMPHORATED CHALK (page 317).

11. (CHARCOAL DENTIFRICE.) From charcoal, preferably that from the willow or the areka nut, either alone or combined with twice its weight of prepared chalk. Scent or medicinals injure it. (See 9, 19, and 26.)

12. (CORAL DENTIFRICE.) See 16, 23, and 25 (*below*).

13. (DESCHAMP'S ALKALINE DENTIFRICE.) From powdered talc, 4 oz.; bicarbonate of soda, 1 oz.; carmine, 6 grs.; oil of mint, 12 or 15 drops.

14. (FLORENTINE DENTIFRICE.) From prepared shells, 4 oz.; orris root, $1\frac{1}{2}$ oz.; bitartrate of potassa, $\frac{3}{4}$ oz.; Florentine lake, q. s. to colour.

15. (GALVANIC DENTIFRICE.) From gold, 3 leaves; silver, 4 leaves; trifurcate them with alum and sulphate of potassa, of each, $1\frac{1}{2}$ dr.; then add, of dry common salt, pellicory of Spain, and Peruvian bark, of each, 1 dr.; prepared hartshorn, 1 oz.; mix, and either colour it blue with smalts or red with lake. A useless compound.

16. (Grosvenor's.) From red coral, 3 lbs.; prepared oyster-shells, $2\frac{1}{2}$ lbs.; orris powder, $\frac{1}{2}$ lb.; oil of rhodium, 25 drops. Rose-pink is now commonly substituted for the coral.

17. (Hemet's.) From cuttle-fish bone, 6 oz.; cream of tartar, 1 oz.; orris root, $\frac{1}{2}$ oz.

18. ('Lancet.') Red bark and Armenian bole, of each, 1 oz.; powdered cinnamon and bicarbonate of soda, of each, $\frac{1}{2}$ oz.; oil of cinnamon, 2 or 3 drops.

19. (Lardner's.) From charcoal, in very fine powder, 1 oz.; prepared chalk, 3 oz.; mix.

20. (Mishle's RATIONAL DENTIFRICE.) From sugar of milk, 3 oz.; pure tannin, 3 drs.; real lake, 1 dr.; oils of mint and aniseed, of each, 7 or 8 drops; neroli, 4 or 5 drops.

21. (MYRRH DENTIFRICE.) From cuttle-fish bone, 6 oz.; myrrh and orris root, of each, 2 oz.

22. (PEARL DENTIFRICE.) From heavy carbonate of magnesia or precipitated chalk, 1 lb.; finest smalts, 3 drs.; essence de petit grain, $\frac{1}{2}$ dr.

23. (Pelletier's QUININE DENTIFRICE.) From prepared red coral, 3 oz.; myrrh, 1 dr.; disulphate of quinine, 12 to 15 grs.

24. (Ph. Russ.) Cinchona bark, 4 oz.; orris root, 2 oz.; catechu and myrrh, of each, $1\frac{1}{2}$ oz.; sal ammoniac, 1 oz.; oil of cloves, 20 drops.

25. (POUDRE DENTIFRICE—P. Cod.) Red coral, red bole, and cuttle-fish bone, of each, 3 oz.; dragon's blood, $1\frac{1}{2}$ oz.; cinnamon, $\frac{1}{2}$ oz.; cochineal, 3 drs.; cloves, 1 dr.; bitartrate of potassa, $4\frac{1}{2}$ oz.; reduce them separately to very fine powder before mixing them. This is the 'coral dentifrice' of the French.

26. (Rignini's.) From charcoal, 1 oz.; yellow bark, $\frac{1}{2}$ oz.

27. (ROSE DENTIFRICE.) From precipitated chalk, 6 oz.; cuttle-fish bone, 3 oz.; bicarbonate of soda, 2 oz.; red lake, $\frac{1}{4}$ oz.; otto of roses, 20 drops.

28. (Ruspini's.) From cuttle-fish bone, 8 oz.; Roman alum and orris root, of each, 1 oz.; cream of tartar, 2 oz.; oil of rhodium, 6 or 8 drops.

29. (VIOLET TOOTH POWDER.) From orris root, 3 oz.; cuttle-fish bone and rose pink, of each, 5 oz.; precipitated chalk, 12 oz.; pure indigo, q. s. to give it a pale violet tinge.

30. (Zieter's.) From finely powdered calcined hartshorn and cuttle-fish bone, of each, 6 oz.; calamus aromaticus, cassia, and pelitory of Spain, of each, 1 oz.; essence of vanilla, 1 dr.; essence of ambergris, 10 or 12 drops.

Powders, Worm. *Syn.* PULVERES ANTHELMINTICI, P. VERMIFUGI, L. *Prep.* 1. (Bouchardat.) Powdered Corsican moss and worm-seed, of each, 5 drs.; calomel, 40 grs.; rub them together.

2. (Collier.) From powdered jalap and scammony, of each, 1 dr.; cream of tartar, 2 drs.; Ethiop's mineral, 3 drs.

3. (Guibourt.) Sulphate of iron, 1 dr.; tansy, 2 drs.; worm-seed, 3 drs.

4. (P. Cod.) Corsican moss and worm-seed, of each, 2 oz.; rhubarb, 1 oz.; rubbed to a fine powder, and carefully mixed.

POX. A corruption of a Saxon word, originally applied to pustules or eruptions of any kind, but now restricted to varicella, variola, vaccinia, and, in its unqualified form, to syphilis. (See *below*.)

Chicken-pox. *Syn.* WATER-POX; VARICELLA, L. An eruptive disease, consisting of smooth, semi-transparent vesicles, of various sizes, which afterwards become white and straw-coloured, and about the fourth day break and scale off, without leaving any permanent mark behind them. In hot weather the discharge sometimes become purulent, and at others the eruption is attended with considerable fever. Sometimes the vesicles assume a pointed form, and the fluid remains clear throughout the disease; it is then frequently called the 'swine-pox.' When the vesicles are large and globular, and their contents, at first whey-coloured, afterwards turn yellow, it is popularly known as 'hives.'

The treatment of chicken-pox consists in

the adoption of a light, vegetable diet, and in the administration of mild saline aperients and cooling drinks.

The chicken-pox, except in children of a very bad habit of body, is an extremely mild disease. Like the smallpox, it rarely attacks the same person more than once during life.

Cow-pox. *Syn.* VACCINIA, VARIOLA VACCINA, L. This disease was proposed as a substitute and a preventive of smallpox, by Dr. Jenner, in 1798, and its artificial production (vaccination) has rendered smallpox a comparatively rare disease in Britain. There appears no reason to doubt that the pretensions of the advocates of vaccination have been fully justified by the experience of more than half a century; or, that this disease, when actively developed, evinced by the completeness and maturation of the pustules, acts as a prophylactic of smallpox.

The process of vaccination is similar to that of inoculation for smallpox. The point of a lance is wetted with the matter taken from one of the pustules, and is then gently inserted under the cuticle, and the scratch afterwards rubbed over with the same. Hæmorrhage should be avoided, as the blood is apt to wash away the virus, or to form a cake which shields the living tissue from its action.

Smallpox. *Syn.* VARIOLA, L. This disease comes on with the usual symptoms of inflammatory fever. About the third day, red spots, resembling flea-bites, make their appearance on the face and head, and gradually extend over the whole body. About the fifth day, small circular vesicles, depressed in the centre, surrounded by an areola, and containing a colourless fluid, begin to form, when the feverish symptoms abate; about the sixth day, the throat becomes sore; about the eighth day, the face is swollen; and about the eleventh day, the pustules acquire the size of a pea, and cease to enlarge, the matter which they contain becomes opaque and yellow, a dark central spot forms on each, the swelling of the face subsides, and secondary symptoms of fever come on; the pustules become rough, break, and scab over, and a dark spot remains for some days, often followed by permanent indentations, popularly known as 'pock-marks.' At the end of the sixteenth or eighteenth day, the symptoms usually disappear. In the confluent smallpox, a severer form of the disease, the pustules coalesce, the eruption is irregular in its progress, and the inflammatory symptoms are more severe.

The treatment of ordinary cases of smallpox resembles, for the most part, that mentioned above for chicken-pox. As soon as the febrile symptoms become marked, the patient should not be suffered to lie in a hot bed, but on a mattress, in a cool and well-ventilated apartment, and antiseptic cooling drinks should be freely administered. When convulsions occur, or great irritability exists, small doses of morphine, opium, or camphor, may be ad-

ministered, and obstinate vomiting arrested by effervescing saline draughts. When the skin is pale and cold, the pulse weak, and the eruption languidly developed, the warm or tepid bath is often serviceable. An infusion of the root of *Sarracenia purpurea*, an American plant, has been strongly recommended as a preventive and cure of smallpox, but many of our most eminent physicians regard it as valueless. The application on the third day of a mask formed of thin muslin, covered with mercurial ointment, and having holes cut in it for the nostrils, eyes, and mouth, will effectually prevent 'pitting.' (Dr. Stewardson.) With the same intention, some persons recommend the puncture of the pustules as soon as they are mature. A solution of India rubber in chloroform is now often painted over the face when the eruption has become fully developed. The chloroform quickly evaporates, leaving an elastic film of india-rubber, which almost entirely removes the itchiness of the pustules and prevents 'pitting.' To remove the pock-marks, whether recent or old, nothing appears to be better than warm sea-bathing, or the use of tepid ioduretted lotions.

The smallpox is eminently contagious, but only attacks the same person once during life. Formerly, a milder form of the disease was propagated by inoculation, a practice introduced into England from Turkey, by Lady Mary Wortley Montague, about the year 1721. At the present day, in England, inoculation, as well as the exposure of a patient labouring under smallpox, is penal, the punishment being either by fine or imprisonment. See COW-POX (*above*).

PRECIPITATE. Any substance which has separated from its solution in a solid and, usually, a pulverulent or flocculent form. The substance by which such a change is produced is called the 'precipitant'; and the act or operation by which it is effected is called 'precipitation.' The old chemists gave this name to several compounds. Red precipitate, or precipitate *per se*, is the red oxide of mercury prepared by heat. White precipitate is the AMMONIATED MERCURY of the B. P.

PRECIPITATION. The formation or subsidence of a precipitate. (See *above*.) When the precipitate is the chief object of the process, it is necessary to wash it, after it is separated, by filtration.

This operation requires little attention when the substance thrown down is insoluble in water; but when it is in some degree soluble in that liquid, great attention is required to prevent the loss which might result from the use of too much water. Preci-

washed with spirit more or less concentrated.

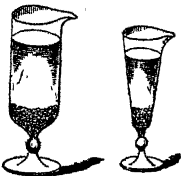

The best precipitating vessel is a very tall glass jar, furnished with a lip and spout, and narrower at the bottom than at the mouth, so that the precipitate may readily collect by subsidence, and the supernatant liquor be decanted off with more ease.

PREGNANCY. For the preservation of the health, and the prevention of the numerous discomforts and dangers which so frequently attend this condition, nothing is so effective as exercise. It is this that is so favourable to the humble peasant, and it is its absence that inflicts such calamities on the wealthier classes. Exercise, moderate and unfatiguing, when assisted by regular habits, and a diet nutritious, but not too liberal, is, indeed, capable of not only affording pleasure and increasing the comforts of existence, but is also generally sufficient to greatly lessen the severity of the sufferings, and to ward off the not unfrequently fatal results which terminate this interesting condition.

The sickness of pregnancy may be greatly ameliorated, if not removed, by the occasional use of a saline aperient, and by effervescing draughts formed with the bicarbonate of potassa and citric acid. The oxalate of cerium is strongly recommended by Professor Simpson, of Edinburgh; as a remedy for obstinate vomiting in pregnancy.—*Dose.* 1 gr. to 2 grs. three times a day in pills.

PRESCRIBING (Art of). Besides a knowledge of diseases and their treatment, much of the success of the physician depends on circumstances connected with the form in which the remedies are exhibited. In writing a prescription, it is necessary to consider the age, sex, temperament, habits, and idiosyncrasy of the patient, as well as the conditions of climate and season, before the selection of the leading medicament, and the apportioning of the dose. The most convenient form of exhibiting it, whether it should be given alone or in some simple form, or combined with other ingredients, the compatibility of the latter, and how far these are likely to assist, impede, or modify its operation, must also receive the consideration of the practitioner. Without a careful attention to all these circumstances, the most valuable remedies may be rendered worthless, and the highest medical skill and the best intentions frustrated.

A prescription generally contains several medicinal substances, which are distinguished by medical writers by names indicative of the office which each of them performs. These are—1. The **BASE**, which is the principle or most active ingredient;—2. The **ADJUVANT**, or that which is intended to promote the action of the base;—3. The **CORRECTIVE**, intended to correct, modify, or control its action, or to cover its odour or taste, as when we add carminatives or diaphoretics to cathartics, or aromatics or liquors to nauseous substances;

pitates soluble in water, but insoluble in alcohol,* are frequently, on the small scale,

—4. The **EXCIPIENT**, or that which gives the whole a commodious or agreeable form, and which, consequently, gives the prescription its peculiar character, as that of draught, mixture, pills, &c. To these, certain Continental writers add a 5th,—**THE INTERMEDIUM**, which is the substance employed to unite remedies which are not, by themselves, miscible with each other, or with the excipient. Of this character are the yolk of egg and mucilage, employed in the preparation of emulsions.

The medicinal substances, with the quantities to be taken, generally arranged as above, are said to form the ‘**inscription**,’—the directions as to their combination or dispensing, which usually come next, the ‘**subscription**,’ and—the orders for the exhibition of the compound medicine, which follow these, the ‘**instructions**.’ These distinctions are, however, in many cases more technical than useful.

In choosing the form of a prescription, it should be recollected that solutions and emulsions generally act with more certainty and rapidly than powders diffused through water; and these, again, than the semi-solid and solid forms of medicine, represented by electuaries, boluses, and pills. On these matters, however, the taste and wishes of the patient should not be disregarded. For this purpose, the taste of nauseous medicines should be disguised, as much as possible, by the judicious selection of an appropriate corrective or excipient. Thus, the disagreeable flavour of Epsom salt may be in a great measure covered by dissolving it in peppermint water; that of aloes, by liquorice; that of castor oil and copaiba by orange peel; and that of powdered bark, by mixing it with milk immediately before taking it; whilst the bitterness of all bitter substances is concealed by strong coffee.

In order that a prescription may be well made, it is not necessary to unite all the elements above referred to. The basis and the excipient are the only two which are absolutely necessary, since there are many medicines which have no need of an adjuvant. The agreeable flavour and odour of some, and the mild and harmless nature of others, often render the intervention of a corrigent unnecessary when they are employed. A single substance may also “be capable of answering two or more purposes. Thus the adjuvant may also act as a corrigent, as when the addition of soap to aloes, or to extract of jalap, lessens their griping properties, and at the same time promotes their action. In the same way neutral salts correct the colic which follows the use of resinous purgatives, and accelerate their action.” According to Garbinius, the number of ingredients in a prescription should scarcely ever exceed three or four. See **DOSE, MEDICINES, INCOMPATIBLES, PILLS, &c.**

PRESCRIPTIONS. Recipes or formulæ for the preparation and exhibition of medicines

intended, generally, for immediate use. See **PRESCRIBING** (*above*).

PRESERVES. A general term, under which are included the various fruits and vegetables which are seasoned and kept in sugar or syrup, more especially those which are so preserved whole or in slices. See **CANDYING, JAM, MARMALADE, &c.**

PRESS (Correcting for the). See **PROOFS**.

PRINCE'S METAL. One of the names for Dutch gold. (See page 580.)

PRINTING (Anastatic). A method of zincography, patented in 1845, having for its object the reproduction of drawings, engravings, and letter-press, from copies however old. To describe briefly the preparation of a plate or cylinder, let us suppose a newspaper about to be reprinted by this means. The sheet is first moistened with dilute acid and placed between sheets of blotting paper, in order that the superfluous moisture may be absorbed. The ink resists the acid, which attacks the blanks only. In all cases where the letter-press is of recent date, or not perhaps older than half a year, a few minutes suffice for this purpose. The paper is then carefully placed upon the plate with which the letter-press to be transferred is in immediate contact, and the whole passed under a press, on removal from which, and on carefully disengaging the paper, the letters are found in reverse on the plate. A preparation of gum is then applied to the plate by means of a roller, after which the letters receive an addition of ink, which is immediately incorporated with that by which they are already formed. These operations are effected in a few minutes. The surface of the plate round the letters is next bitten in a very slight degree by dilute acid, and on the fresh application of the ink it is rejected by the zinc, and received only by the letters, which are charged with the ink by the common roller used in hand-printing. Each letter comes from the press as clear as if it had been imprinted by type metal; and the copies are fac-similes, which cannot easily be distinguished from the original sheet.

When pen-and-ink drawings are to be reproduced, they are made on any paper free from hairs or filaments, and well-sized. The ink used is a preparation made for the purpose, closely resembling lithographic ink, and may be mixed to any degree of thickness in pure distilled water. It should be used fresh, and slightly warm when a fine effect is to be given. In making or copying a design a pencil may be used; but the marks must be left on the paper, and by no means rubbed with India rubber or bread. It is necessary to add, that the paper should be kept quite clean and free from friction, and should not be touched by the fingers, inasmuch as it will retain marks of very slight touches.

Before closing this notice of anastatic printing, it may be proper to remark, that the great pretensions originally set up by the patentees

have not been fulfilled by its extensive adoption in trade.

PRINTING INK. *Prep.*—a. The **VARNISH.** Linseed or nut oil, 10 or 20 galls., is set over the fire in an iron pot capable of containing fully as much more; when it boils, it is kept stirred with an iron ladle, and, if it does not take fire of itself soon after the smoke begins to rise, it is kindled by means of a piece of burning paper, stuck in the cleft end of a long stick; the pot is shortly afterwards removed from the fire, and the oil is suffered to burn for about half an hour, or until a sample of the varnish cooled upon a pallet knife may be drawn into strings of about $\frac{1}{2}$ inch long, between the fingers; the flame is now extinguished by the application of a closely fitting tin cover, and, as soon as the froth of the ebullition has subsided, black resin is added, in the proportion of $\frac{3}{4}$ lb. to 1 lb. for every quart of oil thus treated; the mixture is next stirred until the resin is dissolved, when dry brown soap, cut into slices, $1\frac{1}{2}$ lb., is further added (cautiously), and the ingredients are again stirred with the spatula until the whole is united, the pot being once more placed over the fire to promote the combination; when this is effected, the varnish is removed from the heat, and, after a good stirring, is covered over and set aside.

b. The **INK.** Indigo and Prussian blue, of each, in fine powder, $2\frac{1}{2}$ oz.; mineral lampblack (finest), 4 lbs.; vegetable lampblack, $3\frac{1}{2}$ lbs.; stir them gradually into the warm varnish (a), and submit the mixture to careful grinding, either in a mill or by means of a slab and muller. On the large scale, steam power is now generally employed for this purpose.

An extemporaneous superfine black ink may be made by the following formula:—Take of balsam of copaiba (pure), 9 oz.; lampblack, 3 oz.; indigo and Prussian blue, of each, $\frac{1}{2}$ oz.; Indian red, $\frac{1}{4}$ oz.; yellow soap (dry), 3 oz.; grind the mixture to an impalpable smoothness by means of a stone and muller. Canada balsam may be substituted for balsam of copaiba where the smell of the latter is objectionable, but the ink then dries very quickly.

COLOURED PRINTING INKS are made in a similar way from the following pigments:—Carmine, lakes, vermilion, chrome yellow, red lead, orange red, Indian red, Venetian red, for red; orange chrome, chrome yellow, burnt terra di sienna, gall-stone, Roman ochre, yellow ochre, for orange and yellow; verdigris, Scheele's green, Schweinfurt green, blues and yellows mixed, for greens; indigo, Prussian blue, Antwerp b., cobalt b., charcoal b., for blue; lustre, bronze powders, &c., for metallic colours; and umbria, sepia, &c., for brown.

Obs. It is necessary to prepare two kinds of varnish, varying in consistence, from more or less boiling, to be occasionally mixed together as circumstances may require; that

which answers well in hot weather being too thick in cold, and *vice versa*. Large characters also require a thinner ink than small ones. Old linseed oil is preferable to new. Yellow resin soap is preferred for black and dark-coloured inks, and white curd soap for light ones.

A good varnish may be drawn into threads like glue, and is very thick and tenacious. The oil loses from $10\frac{1}{2}\%$ to $14\frac{1}{2}\%$ by the boiling. Mr. Savage obtained the large medal of the Society of Arts for his black ink made as above.

PRINTS (Ackerman's Liquor for). *Prep.* Take of the finest pale glue and white curd soap, of each, 4 oz.; boiling water, 3 pints; dissolve, then add of powdered alum, 2 oz. Used to size prints and pictures before colouring them.

PROOF. See **ACETIMETRY**, **ALCOHOLOMETRY**, &c.

PROOFS (Correct'ing). The specimen on the next page, with the notes, will, if carefully perused, put the reader into possession of all the secrets of this useful art.

PROPYLIC ALCOHOL. C_3H_7O . *Syn.* HYDRATED OXIDE OF PROPYL, TRITYL ALCOHOL. A liquid boiling at 204.8° Fahr., obtained by repeatedly rectifying the first products of the distillation of the fusel-oil of marc-brandry. It stands to ethylic alcohol (ordinary alcohol) in the same relation in which the latter stands to methylic alcohol (pyroxylic spirit).

PROTEIN. The name given by Mälder to a substance which he regarded as the original matter from which animal albumen, casein, and fibrin, were derived; but which is now considered as a product of the decomposition of those important principles by moderately strong caustic alkali.

Prep. (Liebig.) Albumen, casein, or fibrin is dissolved in moderately strong potassa, the solution heated for some time to 120° Fahr., and acetic acid added; a gelatinous precipitate subsides, which, after being washed and dried, is protein.

Obs. The names binoxide and teroxide of protein have been given by Mälder to products of the long-continued action of boiling water upon fibrin in contact with the air.

PROTIDE. A soluble, straw-yellow substance, formed, along with other products, by the action of strong solution of potassa on albumen, fibrin, or casein. See **ERYTHROPROTIDE**.

PROTO. See **NOMENCLATURE**.

PROVISIONS (Preservation of). See **PURIFICATION**.

PRUNES. [Fr.] The fruit of cultivated varieties of *Prunus domestica* (Linn.). The dried fruit (**FRENCH PRUNES** or **PLUMS**; **PRUNUM**—B. P., Ph. L., **PRUNA**—Ph. E. & D.) is cooling and gently laxative, and, as such, is useful in habitual costiveness and fevers.

Pulp of Prunes. *Syn.* **PREPARED PRUNES**; **PULPA PRUNORUM**, **PRUNUM PREPARATUM**

[Proof.]

1 *Ital.* As the vine, which has long
 2 *S* twined its grac^aeful foliage
 3 *z* about the oak; and been

every disadvantage

[The same corrected.]

As the *vine*, which has long twined its grace-
 ful foliage about the oak, and been lifted by it
 into sunshine, will, when the hardy plant is
 rifted by the thunderbolt, cling round it with its
 caressing tendrils, and bind up its shattered
 boughs, so is it beautifully ordered by Providence,
 that WOMAN, who is the mere dependant and
 ornament of man in his happier hours, should
 be his stay and solace when smitten by sudden
 calamity; winding herself into the rugged re-
 cesses of his nature, tenderly supporting the
 drooping head, and binding up the broken heart.

It also is interesting to notice how *some* minds
 seem almost to create THEMSELVES, springing
 up under every disadvantage, and working their
 "solitary, but irresistible way," through a thou-
 sand obstacles. Nature seems, &c.

IRVING.

Explanation of the marks:

1. When a letter or word is to be in *italics*.
2. When a letter is turned upside down.
3. The substitution of a comma for another point or letter.
4. The insertion of a hyphen; also marked (-).
5. When letters should be close together.
6. When a letter or word is to be omitted.
7. When a word is to be changed to roman.
- 8, 9. Two methods of marking a transposition: when there are several words to be transposed, and they are much intermixed, it is a common plan to number them, and to put the usual mark in the margin.
10. Substitution of a capital for a small letter.
11. When a word is to be changed from small letters to capitals.
12. The transposition of letters in a word.
13. The substitution of one word for another.
14. When a word or letter is to be inserted.
15. When a paragraph occurs improperly.
16. The insertion of a semicolon.
17. When a space or quadrat stands up, and is seen along with the type.
18. When letters of a wrong fount are used.
19. When words crossed off are to remain.
20. The mark for a paragraph, when its commencement has been neglected. Sometimes the sign [or ¶, or the word 'break,' is used instead of the syllables 'New Par.'
21. For the insertion of a space when omitted or insufficient.
22. To change capitals to small letters.
23. To change small letters to small capitals.
24. When lines or words are not straight.
- 25, 26 The insertion of inverted commas. The apostrophe is similarly marked.
27. The insertion of a period when omitted, or in place of another point or letter.
28. Substitution of one letter for another.
29. The method of marking an omission or insertion when too long for the side margin.

(Ph. L.), *L. Prep.* The imported dried fruit is boiled gently for four hours with water, q. s. to cover them, and then pressed, first through a fine cane sieve, and afterwards through a fine hair sieve; the pulp is, lastly, evaporated by the heat of a water bath to the consistence of a confection. A better plan is to use as little water as possible, by which the necessity of subsequent evaporation is avoided. *Used* in the preparation of confection of senna.

PRUNING varies according to the kind of plant or tree operated on, and the particular object in view, and its skilful performance must, therefore, greatly depend on the experience and knowledge of the gardener. "In the operation of pruning, the shoots are cut off close to the buds, or at a distance not greater than the diameter of the branch to be cut off; because without the near proximity of a bud, the wounds will not heal over. In shoots which produce their buds alternately the cut is made at the back of the bud, sloping from it, so that it may be readily covered by the bark in the same or in the following year; but in the case of branches where the buds are produced opposite each other, either one bud must be sacrificed or the branch must be cut off at right angles to its line of direction, which is most conveniently done with the pruning shears." (London.)

PRUSSIAN ALKALI. Ferrocyanide of potassium.

PRUSSIAN BLUE. *Syn.* BERLIN BLUE, PARIS B., FERROCYANIDE OF IRON, PRUSSATE OF IRON, CYANURET OF I. This is the well-known blue pigment of the shops.

Prep. 1. The crude but clear solution of ferrocyanide of potassium (blood lye) is precipitated by a mixed solution of alum, 2 parts, and green sulphate of iron, 1 part; the dingy greenish precipitate that falls gradually becomes blue by absorption of atmospheric oxygen, which is promoted by exposure and agitation of the liquor; as soon as it has acquired its full colour, the sediment is repeatedly washed with water, and is then drained, and dried, at first in a stove, but afterwards on chalk stones. *Product* large, but inferior in quality.

2. Repeatedly digest and wash the precipitate obtained by the above process, in very dilute hydrochloric acid, and then in pure water; drain and dry it, as before. *Superior.*

3. (Paris blue).—*a.* Neutralise the solution of ferrocyanide of potassium (blood lye) with dilute sulphuric acid, precipitate the liquid with a solution of any persalt or sesquisalt of iron (as the persulphate, nitrate, sesquichloride, or peracetate); well wash the precipitate with water, and dry it, as before. A very rich and intense colour.

b. (Hochstätter.) Crystallised ferrocyanide of potassium and green sulphate of iron, of each, 6 parts, are each separately dissolved in water, 15 parts; after the admixture of the solutions, and frequent agitation, oil of vitriol, 1 part,

and fuming hydrochloric acid, 24 parts, are stirred in; after some hours have elapsed, a strained solution of chloride of lime, 1 part, dissolved in water, 80 parts, is gradually added, the addition being stopped as soon as an effervescence from the escape of chlorine is perceived; the whole is now left for 5 or 6 hours, when the precipitate is thoroughly washed in pure soft water, drained, and dried. Or, instead of the above, the precipitate is at once washed in dilute nitric acid, until its colour ceases to be improved by the process. The *product* is of the finest quality.

Prop. Insoluble in water and in dilute acids, except the oxalic, in solutions of which it dissolves freely, when pure; oil of vitriol dissolves it to a white pasty mass, which is again precipitated of the usual blue colour by water; alkalies instantly decompose it, and so do red oxide of mercury and some other oxides when boiled with it; it burns in the air like tinder, leaving an ash of oxide of iron. It is not poisonous.

Pur., &c. The quality of Prussian blue may be estimated by the richness of its colour, and by the quantity of potassa or soda required to destroy this. If it effervesces with acids, it contains chalk; and if it forms a paste with boiling water, it is adulterated with starch. It is pure if, "after being boiled with dilute hydrochloric acid, ammonia throws down nothing from the filtered liquid." (Ph. L. 1836.) It is distinguished from indigo by exhibiting a coppery tint when broken, but which is removed by rubbing with the nail.

Concluding remarks. The commercial Prussian blue is not pure ferrocyanide of iron, but a mixture of this salt with varying proportions of the ferriecyanide of iron and potassium, which also has a fine deep blue colour. The object in employing alum is to prevent or lessen the precipitation of oxide of iron by the free alkali in the blood lye, but a portion of alumina is in consequence thrown down with the blue, and tends to render it paler and increase the product. The quantity of alum employed may be varied according to the shades of the intended blue. Samples containing this contamination must not be employed medicinally. (See page 240.)

Prussian Blue, Soluble. *Prep.* 1. (BASIC PRUSSIAN BLUE.) By adding a solution of protosulphate of iron to a solution of ferrocyanide of potassium; a bluish-white precipitate, turning dark blue by free exposure, is formed, which, after it has acquired this colour, is washed until it begins to dissolve in the water, and colour it blue; it is then either collected and dried, or is at once dissolved in pure water. This variety is not precipitated from its solution by alcohol.

2. (FERROCYANIDE OF POTASSIUM AND IRON.) By precipitating a solution of a sesquisalt or persalt of iron (as the persulphate, pernitrate, peracetate, or sesquichloride) with a stronger solution of ferrocyanide of potassium,

so that the latter may be in considerable excess. A blue precipitate is formed, which is treated as before. This variety is precipitated by alcohol. Both are freely soluble in pure water, but not in water which has the slightest saline contamination. Hence it is that lengthened exposure to the atmosphere, and the use of the common steel pen, causes the gradual precipitation of this substance from its solution when used as ink. See WRITING FLUIDS.

PRUSSIC ACID. See HYDROCYANIC ACID.

PSEUDO-MORPHIA. A substance of little importance, occasionally found in opium. It differs from morphine chiefly in not decomposing iodic acid. It is said to contain nitrogen.

PTISAN. *Syn.* PTISANA, L. A decoction made of pearl barley, liquorice, raisins, and other like vegetable matters, either alone or so slightly medicated as to be taken as a common drink in fevers, catarrhs, &c. Those retained in English pharmacy have been already noticed. The French physicians often employ this form of medicine. The 'tisanes' of the P. Cod. are numerous. See DECOCTION, INFUSION, JULEP, TISANE, &c.

PTYALIN. A peculiar animal matter, analogous to diastase, obtained from the saliva. It is soluble in water, but insoluble in alcohol.

PUCHA PAT. *Syn.* PATCHOULI. Puchá pát is the dried foliaceous tops of *Pogostemon Patchouli*, an Indian species of *Labiatae*. It is much used in perfumery, particularly for making sachets; but its odour, although very durable, is not so agreeable as that of many other substances, unless it is combined with lavender, bergamot, ambergris, musk, or some other like perfume.

PUDDINGS. The instructions given under **CAKES**, **PIES**, &c., will be found, with some slight modifications, also to apply to puddings, and, therefore, need not be repeated here. Soyer tells us that every sort of pudding, if sweet or savory, is preferably dressed in a basin, instead of in a cloth. If boiled in a basin, the paste receives all the nutriment of the materials, which, if boiled in a cloth, are dissolved out by the water, when by neglect it ceases boiling. To cause them to turn well out, the inside of the basin should be thoroughly 'larded' or rubbed with butter.

In the preparation of meat puddings the "first and most important point is never to use any meat that is tainted; for in pudding, above all other dishes, it is least possible to disguise it by the confined progress which the ingredients undergo. The gradual heating of the meat, which alone would accelerate decomposition, will cause the smallest piece of tainted meat to contaminate all the rest. Be particular, also, that the suet and fat are not rancid, ever remembering the grand principle that everything which gratifies the palate nourishes."

A pudding-cloth, however coarse, ought

never to be washed with soap; it should be simply dried as quickly as possible, and kept dry and free from dust, and in a drawer or cupboard free from smell." (Soyer.)

PUD'DLING. See IRON.

PULMONITIS. Inflammation of the lungs.

PULP. *Syn.* PULPA, L. The softer parts of plants, more particularly of fruits, separated from the fibrous and harder portions.

"Pulpy fruits, if they be unripe, or ripe and dried, are to be placed in a damp situation until they become soft; then the pulp is to be pressed out through a hair sieve; afterwards, it is to be boiled with a gentle heat, frequently stirring; and, finally, the (excess of) water is to be evaporated in a water bath, until the pulp acquire proper consistence.

"Press the pulpy fruits which are ripe and fresh through a hair sieve, without boiling them." (Ph. L. 1836.)

PULVERISATION. The reduction of any substance to dust or powder.

On the small scale, pulverisation is usually performed by means of a pestle and mortar; on the large scale, by stamping, grinding or cutting the substance in a mill. A few soft substances, as carbonate of magnesia, carbonate of lead, &c., may be pulverised by simply rubbing them through a fine sieve, placed over a sheet of paper; whilst many hard, gritty substances can only be reduced to fine powder by porphyrisation or levigation. Elutriation, or 'washing over,' is adopted for several substances, as chalk, antimony, &c., which are required to be reduced to fine powder on the large scale. For some articles which are very tough, fibrous, or resisting, a rasp or file is employed. Whichever of these methods is adopted, the body to be powdered must be very dry, and where spontaneous drying is insufficient, artificial desiccation in a stove or oven, gently heated, is employed. To facilitate this, the substance should be first cut into pieces or crushed small. On the other hand, a few substances, as rice, sago, nux vomica, and St. Ignatius's bean, are often soaked in water, or steamed, before being further operated on. Whenever a substance cannot be dried completely, without an alteration of its properties, an intermediate is had recourse to, by which the moisture may be absorbed, or its state of aggregation modified. Thus, sugar is employed in pulverising civet, musk, nutmeg, and vanilla. When camphor is to be pulverised, the addition of a very small quantity of alcohol renders the operation easy. In other cases, the intermediate is of so hard a nature as to assist in breaking down the substance to be powdered; thus, gold leaf is reduced to powder by rubbing it with sulphate of potassa, and afterwards removing this last by means of water. Fusible metals, as zinc and tin, are powdered by pouring them into a mortar, and stirring them rapidly whilst cooling; or, by briskly agitating them, in the melted state, in a wooden box covered with chalk or whiting. Phosphorus is

powdered by melting it in urine or lime water, and then shaking the bottle until its contents have become quite cold. Glass, quartz, and silicated stones, require to be heated red hot, and in this state to be thrown into cold water, by which they become sufficiently friable to admit of pulverisation. Many salts which are reduced to fine powder with very great difficulty, and do not dissolve in spirit of wine, are easily obtained in a pulverulent form, by agitating their concentrated aqueous solution with a considerable quantity of rectified spirit; the disengaged fine crystallised powder may then be dried, and further divided by trituration. Potassio-tartrate of antimony may be advantageously thus treated. A large number of salts, including nitre, sal ammoniac, and carbonate of potash, may also be reduced to powder by keeping their solutions in a state of constant and violent agitation during their rapid evaporation.

The following rules should be observed in the preparation of powders:—

1. If possible, perfectly dry articles should alone be operated on, and only in dry weather.

2. The nature of the mortar, and the mode of operating, should be adapted to the nature of the substance. Thus, woods and barks should be pulverised in an iron mortar; sugar, alum, and nitre, in one of marble or wedgwood-ware; and corrosive sublimate, only in one of glass.

3. The mortar should be provided with a cover, to prevent loss and annoyance to the operator. If much powder escapes, or if it is dangerous or disagreeable when breathed, or if the substance is rare or costly, the mortar should be covered with a skin of leather, to which the pestle is attached, so that the latter may be freely moved without causing the slightest opening for the escape of the dust occasioned by the process. When aloes or gamboge is powdered, a few drops of olive oil are commonly added, with the same intention.

4. The pulverised portions should be separated from time to time, by aid of a sieve, the coarser particles being returned to the mortar to be again beaten and triturated; and this alternate pulverisation and sifting is to be repeated until the process is complete.

PUMICE STONE. *Syn.* PUMEX, LAPIS PUMICEUS, L. RUMICUS, L. Round in the neighbourhood of volcanoes. *Used,* in the solid form, to polish wood, paint, &c.; also, when pulverised, as a polishing powder for glass, bone, ivory, marble, metals, &c.

PUNCH. An acidulous, intoxicating beverage, composed of water sweetened with sugar, with a mixture of lemon juice and spirit, to which some aromatic, as nutmeg, mace, or cinnamon, is occasionally added. Wine is sometimes substituted for spirit. It is much less drunk than formerly. Rum punch is the most popular amongst sailors, who are now the principal consumers of this beverage.

Prep. 1. Juice of 3 or 4 lemons; yellow peel of 1 lemon; lump sugar, $\frac{3}{4}$ lb.; boiling water, $3\frac{1}{2}$ pints; infuse $\frac{1}{2}$ an hour, strain, and add, of bitter ale, $\frac{1}{2}$ pint; rum and brandy, of each, $\frac{3}{4}$ to 1 pint (or rum alone, $1\frac{1}{2}$ to 2 pints). More hot water and sugar may be added if the punch is desired either weaker or sweeter.

2. (COLD PUNCH.) From arrack, port wine, and water, of each, 1 pint; juice of 4 lemons; white sugar, 1 lb.

3. (GIN PUNCH.) From the yellow peel of $\frac{1}{2}$ a lemon; juice of 1 lemon; strongest gin, $\frac{1}{2}$ pint; water, $1\frac{1}{2}$ pint; sherry, 1 glassful.

4. (ICED PUNCH.) From champagne or Rhenish wine, 1 quart; arrack, 1 pint; juice of 6 lemons; yellow peel of 3 lemons; white sugar, 1 lb.; soda water, 1 or 2 bottles; to be iced as cream.

5. (MILK PUNCH; VERDER.) Steep the yellow rinds of 18 lemons and 6 oranges, for 2 days, in rum or brandy, 2 quarts; then add, 3 quarts more of either spirit; hot water, 3 quarts; lemon juice, 1 quart; loaf sugar, 4 lbs.; 2 nutmegs, grated; and boiling milk, 2 quarts; mix well, and in 2 hours strain the liquor through a jelly-bag.

6. (NORFOLK PUNCH.) Take of French brandy, 20 quarts; yellow peels of 18 oranges and 30 lemons; infuse for 12 hours; add, of cold water, 30 quarts; lump sugar, 20 lbs.; and the juice of the oranges and lemons; mix well, strain through a hair sieve, add of new milk, 2 quarts, and in 6 weeks bottle it. Keeps well.

7. (ORANGE PUNCH.) As No. 1, using oranges, and adding some orange wine, if at hand. A little curaçoa, nøyau, or mareschino, improves it.

8. (RASPBERRY PUNCH.) As the last, but using raspberry juice, or raspberry vinegar, for the oranges or lemons.

9. (REGENT'S PUNCH.) From strong hot green tea, lemon juice, and capillaire, of each, $1\frac{1}{2}$ pint; rum, brandy, arrack, and curaçoa, of each, 1 pint; champagne, 1 bottle; mix, and slice a pineapple into it.

10. (TEA PUNCH.) From strong hot tea, 1 quart; arrack, $\frac{1}{2}$ bottle; white sugar, 6 oz.; juice of 8 lemons; and the yellow rinds of 4 lemons; mixed together.

11. (WINE PUNCH.) From white sugar, 1 lb.; yellow peel of 3 lemons; juice of 9 lemons; arrack, 1 pint; port or sherry (hot), 1 gal.; cinnamon, $\frac{1}{2}$ oz.; nutmeg, 1 dr.; mix.

12. (YANKEE PUNCH.) Macerate sliced pineapple, 3 oz.; vanilla, 6 grs.; and ambergris (rubbed with a little sugar), 1 gr., in the strongest pale brandy, 1 pint, for a few hours, with frequent agitation; then strain with expression; add, of lemon juice, 1 pint; lemon syrup, and either claret or port wine, of each, 1 bottle; with sugar, $\frac{1}{2}$ lb., dissolved in boiling water, $1\frac{1}{2}$ pint. See SHRUB.

PURGATIVES. *Syn.* DEJECTORIA, PURGANTIA, PURGATIVA, L. These have been divided into five orders or classes, according to

their particular actions. The following are the principal of each class:—

1. (LAXATIVES, LENTIVES, OR MILD CATHARTICS.) Manna, cassia pulp, tamarinds, prunes, honey, phosphate of soda; castor, almond, and olive oils; ripe fruit.

2. (SALINE OR COOLING LAXATIVES.) Epsom salt, Glauber's salt, phosphate of soda (tasteless salt), seidlitz powders, &c.

3. (ACTIVE CATHARTICS, Occasionally acrid, frequently tonic and stomachic.) Rhubarb, senna, aloes, &c.

4. (DRASTIC OR VIOLENT CATHARTICS.) Jalap, scammony, gamboge, croton oil, colocynth, elaterium, &c.

5. (MERCURIAL PURGATIVES.) Calomel, blue-pill, quicksilver with chalk, &c.

In prescribing purgatives, regard should be had to the particular portion of the alimentary canal on which we desire more immediately to act, as well as to the manner in which the medicine effects its purpose. Thus, Epsom salt, sulphate of potassa, and rhubarb, act chiefly on the duodenum; aloes, on the rectum; blue pill, calomel, and jalap, on the larger intestines generally; and tartrate and bitartrate of potassa, and sulphur, on the whole length of the intestinal canal. Again, others are stimulant, as aloes, croton oil, jalap, scammony, &c.; others are refrigerant, as most of the saline aperients; magnesium and its carbonate are both aperient and antacid; whilst another class, including rhubarb, damask roses, &c., are astringent. Further, some produce only serous or watery dejections, without greatly increasing the peristaltic action of the bowels; whilst a few occasion a copious discharge of the feces in an apparently natural form. See DRAUGHT, MIXTURE, PILLS, PRESCRIBING, &c.

PURL. *Prep.* To ale or beer, $\frac{1}{2}$ pint, gently warmed, add of bitters, 1 wine-glassful, or q. s. Some add a little spirit. A favourite beverage with hard drinkers early in the morning.

PURPLE. A rich compound colour, produced by the admixture of pure blue and pure red. This colour has always been the distinguishing badge of royalty and distinction. The celebrated Tyrian purple was produced from a shell-fish called murex.

Purple, Aniline. *Syn.* PERKIN'S PURPLE, MAUVE. This valuable dye-stuff is prepared under W. H. Perkin's patent, by mixing solutions of sulphate of aniline and bichromate of potassa in equivalent proportions, and, after some hours, washing the black precipitate with water, drying it, digesting it repeatedly in coal-tar naphtha, and, finally, dissolving it in boiling alcohol. It may be further purified by evaporating the alcoholic solution to dryness, dissolving the residue in a large quantity of boiling water, reprecipitating by caustic soda, washing with water, dissolving in alcohol, filtering, and evaporating to dryness. Thus purified, mauve forms a brittle substance,

having a bronze-coloured surface. It imparts a deep purple colour to cold water, though dissolving sparingly in that liquid; it is more soluble in hot water, and very soluble in alcohol. See PURPLE DYE (*below*), and TAR COLOURS.

Purple of Cassius. *Syn.* PURPLE PRECIPITATE OF CASSIUS, GOLD PURPLE, GOLD PREPARED WITH TIN; AURUM STANNO PARATUM, PURPURA MINERALIS CASSII, *L.* *Prep.* 1. Crystallised protochloride of tin, 1 part; crystallised perchloride of tin, 2 parts; dissolve each separately, mix the solutions, and add of crystallised terchloride of gold (in solution), 1 part; carefully wash, and dry the precipitate. Very fine.

2. (Frick.) Dissolve pure grain tin in cold dilute aqua regia, until the fluid becomes faintly opalescent, then take the metal out and weigh it; next, dilute the solution largely with water, and add, simultaneously, a dilute solution of gold and dilute sulphuric acid in such proportion that the tin in the one shall be to the gold in the other in the ratio of 10 to 36.

3. (P. Cod.) Terchloride of gold, 1 part, is dissolved in distilled water, 200 parts; another solution is made by dissolving, in the cold, pure tin, 1 part, in a mixture of nitric acid, 1 part, and hydrochloric acid, 2 parts; this last solution is diluted with distilled water, 100 parts, and is then added to the solution of terchloride of gold until precipitation ceases to take place; the powder is, lastly, washed by decantation, and dried by a very gentle heat.

4. Silver, 150 parts; gold, 20 parts; pure grain tin, 35 parts; fuse them together under charcoal and borax, cool, laminate, and dissolve out the silver with nitric acid.

Obs. Purple of Cassius is generally supposed to be a combination of oxide of gold and sesquioxide of tin, in which the latter acts as an acid. Heat resolves it into a mixture of metallic gold and binocide of tin. It is used as a purple in porcelain painting, and to communicate a ruby red colour to glass, when melted in open vessels.

PURPLE DYE. The purples now in vogue are the numerous shades of 'mauve' and 'magenta' obtained by the 'aniline colours.' (See *above*, also RED.) For silk and woollen goods, no mordant is required. The proper proportion of the clear alcoholic solution is mixed with water slightly warm, any scum that may form is cleared off, and the goods are entered and worked until the required shade is obtained; a small quantity of acetic or tartaric acid is recommended to be added in some cases. For dyeing on cotton with the aniline colours, the cloth or yarn is steeped in sumac or tannic acid, dyed in the colour, and then fixed by tin; or it may be steeped in sumac and mordanted with tin, and then dyed. Purples were formerly, and are still occasionally, produced, by first dyeing a blue in the 'indigo

vat,' and then dyeing a cochineal or lac scarlet upon the top. See VIOLET DYE.

PURPURATE OF AMMONIA. See MUREXIDE.

PURPURIC ACID. See MUREXAN.

PURPURIN. $C_9H_6O_3$. *Syn.* MADDER PURPLE. The name given by Robiquet and Colin to a beautiful colouring principle obtained from madder.

Prep. Coarsely powdered madder is allowed to ferment with water, after which it is boiled in a strong solution of alum; the decoction is next mixed with sulphuric acid, and the resulting red precipitate is purified by one or more crystallisations from alcohol.

Prop., &c. Crystalline red needles, insoluble in cold water, but soluble in hot water, and in alcohol, ether, and solutions of alum and the alkalies. It differs from alizarin or madder red in containing 2 atoms less of carbon.

PURREE. *Syn.* INDIAN YELLOW. A yellow substance, of doubtful origin, imported from China and India, and now extensively used in both oil and water-colour painting. According to the researches of Stenhouse and Erdmann, it consists of purreic acid, a strongly tinctorial vegetable substance, united to magnesia.

PURREIC ACID. *Syn.* EUXANTHIC ACID. This substance is obtained from purree. It crystallises in nearly colourless needles, which are only sparingly soluble in cold water, and forms rich yellow-coloured compounds with the alkalies and earths. Heat converts it into a neutral, crystallisable substance, called purrone.

PUS. The cream-like, white or yellowish liquid secreted by wounded surfaces, abscesses, sores, &c.

PUTREFACTION. *Syn.* PUTREFACTIO, L. The spontaneous decomposition of animal and nitrogenised vegetable substances, under the joint influence of warmth, air, and moisture. The solid and fluid matters are resolved into gaseous compounds and vapours, which escape, and into earthy matters, which remain. The most striking characteristic of this species of decomposition is the ammoniacal or fetid exhalations that constantly accompany it.

The nature of putrefaction, and the conditions essential to its occurrence, have been briefly alluded to under FERMENTATION, to which we must refer the reader. It may here, however, be useful to reiterate that this change can only be prevented by the abstraction or exclusion of the conditions essential to its occurrence. This may be effected by—reduction of temperature,—exclusion of atmospheric air, or—the abstraction of moisture. The antiseptic processes in common use are effective in precisely the same degree as these preventive means are carried out. Frozen meat may be preserved for an unlimited period, while the same substance will scarcely keep for more than a few days at the ordinary heat of summer. Animal substances will also remain uninjured for a

long period if kept in vessels from which the air is entirely excluded, as in the process now so extensively adopted for the preservation of fresh meat for the use of our army and marine. The third condition is fulfilled when nitrogenised matter is preserved in alcohol, brine, or any similar fluid, and when it is dried. In either case water is abstracted from the surface, which then loses its propensity to putrefy, and forms an impervious layer, which excludes atmospheric oxygen from the interior and softer portion of the substance. Creasote, and most of the antiseptic salts, also act in this way.

Among special antiseptic processes are the following:—

APPLICATION OF COLD. The accession of putrefaction is prevented, and its progress arrested, by a temperature below that at which water freezes. In the colder climates of the world, butcher's meat, poultry, and even vegetables, are preserved from one season to the other in the frozen state. In North America millions are thus supplied with animal food, which, we can state, from personal experience, is often superior in flavour, tenderness, and apparent freshness, to that from the recently killed animal. In temperate climates, and in cold ones during their short summer, ice-houses and ice-safes afford a temperature sufficiently low for keeping meat fresh and sweet for an indefinite period. Substances preserved in this manner should be allowed to gradually assume their natural condition before cooking them; and on no account should they be plunged into hot water, or put before the fire, whilst in the frozen state.

BUCANING. A rude kind of drying and smoking meat, cut into thin slices, practised by hunters in the prairies and forests.

DESICCATION OR DRYING. In this way every article of food, both animal and vegetable, may be preserved, without the application of salt or other foreign matter. The proper method is to expose the substances, cut into slices or small fragments, in the sun, or in a current of warm dry air, the temperature of which should be under 140° Fahr. Articles so treated, when immersed for a short time in cold water, to allow the albumen and organic fibres to swell, and then boiled in the same water, are nearly as nutritious as fresh meat cooked in the same manner. If a higher degree of heat than 140° be employed for animal substances, they become hard and insipid. Owing to the practical difficulties in the way of applying the above process to fresh meats, it is usually employed in conjunction with either salting or smoking, and, frequently, with both of them.

EXCLUSION OF ATMOSPHERIC AIR. This is effected by the method of preserving in sugar, potting in oil, and, more particularly, by some of the patented methods noticed below. Fresh meat may be preserved for some months in that state, by keeping it in water perfectly

deprived of air. In practice, some iron filings and sulphur may be placed at the bottom of the vessel, over which must be set the meat; over the whole is gently poured recently boiled water, and the vessel is at once closed, so as to exclude the external air.

IMMERSION IN ANTISEPTIC LIQUIDS. One of the commonest and most effective liquids employed for this purpose is alcohol of 60 to 70%, to which a little camphor, ammonia, sal ammoniac, or common salt, is occasionally added. A cheaper and equally efficient plan is to employ a weak spirit holding a little creasote in solution. A weak solution of sulphurous acid may be substituted for alcohol. Weak solutions of alum, or carbolic acid, with or without the addition of a few grains of corrosive sublimate, or of arsenious acid, are also highly antiseptic. These are chiefly employed for anatomical specimens, &c. A solution containing only $\frac{1}{1000}$ th part of nitrate of silver is likewise very effective; but, from this salt being poisonous, it cannot be employed for preserving articles of food. Butcher's meat is occasionally pickled in vinegar. By immersing it for 1 hour in water holding $\frac{1}{1000}$ th part of creasote in solution, it may be preserved unchanged for some time, even during summer.

INJECTION OF ANTISEPTIC LIQUIDS into the veins or arteries of the recently killed animal. It is found that the sooner this is done after the slaughter of the animal the more effective it becomes, as the absorbent power of the vessels rapidly decrease by age. See **GANNAL'S PROCESS** (*below*.)

JERKING is a method of preserving flesh sometimes adopted in hot climates. It consists in cutting the lean parts of the meat into thin slices, and exposing these to the sun's fire until quite dry and brittle, when they are bruised in a mortar, and pressed into pots.

PICKLING IN VINEGAR. In this method the substances, rendered as dry as possible by exposure to the air, are placed in glass or stone-ware jars (not salt-glazed), or wooden vessels, when strong vinegar, either cold or boiling hot, is poured over them, and the vessel at once closely corked, or otherwise covered up, and preserved in a cool situation. Meat is occasionally thus treated; vegetables frequently so. See **PICKLE**.

POTTING IN OIL. In this case salad or olive oil is substituted for vinegar (see *above*), and is always used cold.

SALTING acts chiefly by abstracting water from the albuminous portions of the meat, by which its disposition to change is lessened.

SMOKING. This process, which, as well as the last, is referred to further on, acts both by the abstraction of moisture and the antiseptic properties of certain substances (creasote, &c.) contained in wood smoke. Fresh meat and fish are occasionally smoked; but, in general, substances intended to be thus treated are first salted.

In Donkin and Gamble's patent process, the substances, previously parboiled, are placed in small tin cylinders, which are then filled up with rich soup; the lids are next soldered on quite air-tight, and a small hole is afterwards made in the centre; the cylinders are then placed in a bath of strong brine, or a strong solution of chloride of calcium, which is at once heated to the boiling-point, to nearly complete the cooking process; after which the small hole in the lid is hermetically sealed, by covering it with solder while the vessel still remains boiling hot; the tins are, lastly, again submitted to heat in the heated bath, the duration of which is proportioned to the quantity and character of their contents, the 'dressing' of which is to be perfected by this operation. The ends of the tins, on cooling, assume a concave form, from the pressure of the atmosphere, without which they cannot be air-tight, and the process has been unsuccessful. To determine this, the patentees expose the canisters, prepared as before, for at least a month, in an apartment heated to about 100° Fahr.; when, if the process has failed, putrefaction commences, and the ends of the cases, instead of remaining concave, bulge, or become convex. This is called the 'test.' By this process, which was invented by M. Appert in France, about the year 1808, fish, flesh, poultry, and vegetables, may be preserved for years, in any climate.

Goldner's process differs somewhat from the preceding, in the employment of a higher degree of heat, more hastily applied, and not prolonged or repeated after the tins are soldered up.

Gannal's process, having for its object the preservation of butcher's meat in the fresh state, depends on the peculiar absorbent property of the flesh of recently killed animals, above referred to. This process consists in injecting a solution of sulphate of alumina, or, better, of chloride of aluminium, of the sp. gr. 1.070 to 1.085 (10° to 12° Baumé), into the carotid artery, by means of a syphon, as soon as the blood ceases to flow from the slaughtered animal; both extremities of the jugular vein being previously tied. 9 to 12 quarts of the solution are sufficient for an ox, and a proportionate quantity for smaller animals. A less quantity is also required in winter than summer. When the animal has been well bled, and the injection skilfully performed, it is scarcely perceptible that the animal has undergone any preparation. The injected animal is cut up in the usual way; and when intended to be eaten within 2 or 3 weeks merely requires to be hung up in a dry, airy situation, free from flies; but if it is to be kept for a longer period, it is directed to be washed with a mixed solution of common salt and chloride of aluminium at 10° Baumé, and then simply dried and packed in clean air-tight barrels, and kept in a cool, dry place. If the air cannot be perfectly excluded, it should be

packed in dry salt, not for the purpose of preserving it, but to prevent the vegetation of bissus, as, without this precaution, the meat becomes musty from exposure and the action of moisture. Meat preserved by this process may be kept for several years, and merely requires soaking for 24 hours in water, for the purpose of swelling its pores, to give it the appearance and taste of fresh meat, fit for either roasting or boiling. For hot climates a somewhat stronger solution, or a larger quantity of the usual one, may be injected. The use of the strong solutions ordered in some recent works, however, deprives the flesh of a portion of its apparent freshness, and makes it more nearly approach in flavour to that which has been slightly salted in the ordinary manner.

In addition to the above, it may be added that both flesh and fish may be preserved by dipping them into, or brushing them over with, pyroligneous acid, and then drying them. This gives them a smoky flavour; but if pure acetic acid (Ph. L.) be used, no taste will be imparted. These fluids may be applied by means of a clean painter's brush, or even a stiff feather. A table-spoonful is sufficient to brush over a large surface. Fish and flesh so prepared will bear a voyage to the East Indies, and back, uninjured.

Fish may also be preserved in a dry state, and perfectly fresh, by means of sugar alone. Fresh fish may be thus kept for some days, so as to be as good when boiled as if just caught. If dried and kept free from mouldiness, there seems no limit to their preservation; and they are much more nutritious in this way than when salted. This process is particularly valuable in making what is called 'kippered salmon;' and the fish preserved in this manner are far superior in quality and flavour to those which are salted or smoked. A few table-spoonfuls of brown sugar are sufficient for a salmon of five or six pounds' weight; and if salt be desired, a teaspoonful or two may be added. Saltpetre may be used, instead of salt, if it be wished to make the kipper hard.

The well-known property possessed by ether, alcohol, pyroxylic spirit, chloroform, and certain other hydrocarbons, of averting putrefaction, has been thus applied by M. Robin:—He encloses the meat or other substances to be preserved in a glass case, along with a sponge or a capsule containing the preservative liquid, which latter is continually evolved in a vaporous condition, and exercises the preservative agency. In this way the vapours of hydrocyanic acid are found to be very efficacious. Camphor is thus employed in the MUMMY CASES in the British Museum.

It has been asserted by Mr. George Hamilton, that in an atmosphere of binocide of nitrogen, in the dark, flesh preserves its natural colour and freshness for about 5 months; and eats well, provided it be boiled in open vessels, to expel nitrous fumes. See ANIMAL SUB-

STANCES, CANDYING, EGG, FISH, FRUIT, MILK, PICKLES, POTTING, PRESERVES, SALT-ING, SMOKING, STUFFING, VEGETABLE SUBSTANCES, &c.

PUTTY. This name is given to the following preparations (when used alone, 'Glazier's putty' is generally indicated):—

Glazier's Putty. From whitening made into a stiff paste with drying oil. It is used to fix panes of glass in sashes, to fill holes and cracks in wood before painting it, &c.

Plasterer's Putty. A fine cement used by plasterers, made of lime only. It differs from 'FINE STUFF' in the absence of hair.

Polisher's Putty. *Syn.* PUTTY POWDER, CALCINE; CINERES STANNI, STANNI OXYDUM CRUDUM, L. A crude peroxide of tin, obtained by exposing metallic tin in a reverberatory furnace, and raking off the dross, as it forms; this is afterwards calcined until it becomes whitish, and is then reduced to powder. Another method is to melt tin with rather more than an equal weight of lead, and then to rapidly raise the heat so as to render the mixed metal red hot, when the tin will be immediately flung out in the state of 'putty' or 'peroxide.' The products of both these processes are very hard, and are used for polishing glass and japan work, and to colour opaque white enamel. See TIN.

PUZZOLANA, PUZZOLANA, or, more correctly, PUZZOLANA, is a volcanic ash, found at Puzzuoli, near Naples. When mixed with lime, it forms an excellent hydraulic cement. A good FACTITIOUS PUZZOLANA may be made by heating a mixture of 3 bushels of clay and 1 bushel of fresh-slaked lime, for some hours, to redness. (M. Bruyere.) See CEMENT and MORTAR.

PYRITES. A term applied to several native metallic sulphides. IRON PYRITES is the best known of these.

PYRO- The term is applied to several acids that are obtained by the action of heat on other substances; as, PYROGALLIC ACID, PYROLIGNEOUS A., &c.

PYROACE'TIC SPIRIT. See SPIRIT (Pyroacetic).

PYROGALLIC ACID. $\text{HC}_6\text{H}_3\text{O}_6$. *Syn.* ACIDUM PYROGALLICUM, L. *Prep.* 1. From either gallic or tannic acid, heated in a retort, by means of an oil bath, and steadily maintained at a temperature of about 420° Fahr. as long as crystals are formed in the neck of the retort, or in the receiver, both of which should be kept well cooled. Pure. If a much higher heat is employed, the product consists chiefly of metagallie acid.

2. From Aleppo galls, in very coarse powder, heated in a dish covered with thin filtering paper pasted to its edge, and connected with a well-cooled receiver. Dr. Ure says that the so-called Chinese galls furnish, by dry distillation, a "very concentrated solution of pyrogallie acid, which, evaporated on the water bath, yields of brown crystalline

pyrogallie acid nearly 15% of the weight of the galls."

3. (Dr. Stenhouse.) By sublimation from the dry aqueous extract of nut-galls, in a Mohr's apparatus, in the same way that benzoic acid is obtained from benzoin resin (see page 208), observing the precautions referred to in No. 1 (*above*). Nearly pure. The product is fully 10% of the weight of extract operated on.

Prop. Light crystals, which, when perfectly pure, are quite white; freely soluble in water, but the solution cannot be evaporated without turning black and suffering decomposition; it strikes a rich blackish-blue colour with the protosalts of iron, and reduces those of the sesquioxide to the state of protoxide; when heated to 480° Fahr., it is converted into METAGALLIC ACID and water.

Uses, &c. Pure pyrogallie acid is now very extensively employed in photography. A solution of the crude acid mixed with a little spirit is used to dye the hair, to which it imparts a fine brown colour, but has the disadvantage of also staining the skin when applied to it.

PYROGEN ACIDS. Those generated by heat.

PYRO'LA. See WINTER GREEN.

PYROLIG'NEOUS ACID. *Syn.* VINEGAR OF WOOD†, SPIRIT OF W.†, SMOKING LIQUOR†, ESSENCE OF SMOKE†; ACIDUM PYROLIGNOSUM, L. Impure acetic acid, obtained by the destructive distillation of wood in close vessels. It comes over along with tar, creasote, and other liquid and gaseous matters. In this state it contains much empyreumatic matter in solution; but by separation from the tar, saturation with slaked lime or chalk, defecation, and evaporation, an impure acetate of pyrolignite of lime is obtained, which, after being gently heated, to destroy part of its empyreumatic matter, without injuring its acetic acid, is again dissolved and defecated, and then precipitated by a solution of sulphate of soda, when a solution of acetate of soda and a precipitate of sulphate of lime are formed by double decomposition. The solution is next evaporated to dryness, the dry mass (pyrolignite of soda) dissolved in water, and the new solution filtered and recrystallised. The crystals of acetate of soda, obtained by the last process, yield nearly pure acetic acid by distillation along with sulphuric acid. See ACETIC ACID and VINEGAR.

PYROLIG'NEOUS SPIRIT. See SPIRIT (Pyroxilic).

PYROM'ETER. An instrument to measure high degrees of heat. WEDGWOOD'S PYROMETER, the one best known, depends on the property which clay possesses of contracting when strongly heated. PROF. DANIEL'S PYROMETER consists, essentially, of a small rod or bar of platinum, which acts in a precisely opposite manner to the preceding, viz., by its expansion.

PYROPH'ORUS. *Syn.* LUFT-ZUNDER, Ger.

Any substance that inflames spontaneously when exposed to the air.

Prep. 1. Neutral chromate of lead, 6 parts; sulphur, 1 part; triturate them with water, q. s. to form a paste, and make this into pellets; dry these perfectly by a gentle heat, then heat them in a closed tube until the sulphur is all driven off; lastly, transfer them to a stoppered phial.

2. (HOMBERG'S PYROPHORUS.) From alum and brown sugar, equal parts; stir the mixture in an iron ladle over the fire until dry, then put it into an earthen or coated glass phial, and keep it at a red heat so long as flame is emitted; it must then be carefully stopped up and cooled.

3. (Dr. Hare.) Lampblack, 3 parts; burnt alum, 4 parts; carbonate of potassa, 8 parts; as the last.

4. (Gay Lussac.) From sulphate of potassa, 9 parts; calcined lampblack, 5 parts; as No. 2.

5. Alum, 3 parts; wheat flour, 1 part; as No. 2.

6. (LEAD PYROPHORUS—Göbel.) Heat tartrate of lead to redness in a glass tube, and then hermetically seal it. See TARTRATE OF LEAD.

Obs. When the above are properly prepared, a little of the powder rapidly becomes very hot, and inflames on exposure to the air. The accession of the combustion is promoted by moisture, as a damp atmosphere or the breath. With the exception of the first and sixth, "they owe their combustibility to the presence of sulphide of potassium." (Gay Lussac.)

PYROPHOSPHOR'IC ACID. See DIBASIC PHOSPHORIC ACID.

PYRO'SIS. *Syn.* BLACK WATER, WATER BRASH, WATER QUALM. An affection of the stomach, attended by a sensation of heat and the eructation of a thin, sour liquid, often in considerable quantity, especially in the morning. It is a variety of HEARTBURN (which *see*).

PYROTARTAR'IC ACID. $H_2C_6H_6O_4$. Obtained by the destructive distillation of tartaric acid. See TARTARIC ACID.

PYROTECH'NY. The art of making fireworks. The three principal materials employed in this art are charcoal, nitre, and sulphur, along with filings of iron, steel, copper, or zinc, or with resin, camphor, lycopodium, or other substances, to impart colour, or to modify the effect or the duration of the combustion. Gunpowder is used "either in grain, half crushed, or finely ground, for different purposes. The longer the iron filings are, the brighter red and white spots they give; those being preferred which are made with a coarse file, and quite free from rust. Steel filings and cast-iron borings contain carbon, and afford a more brilliant fire, with wavy radiations. Copper filings give a greenish tint to flame; those of zinc, a fine blue colour; the

sulphide of antimony gives a less greenish blue than zinc, but with much smoke; amber affords a yellow fire, as well as colophony (resin) and common salt; but the last must be very dry. Lampblack produces a very red colour with gunpowder, and a pink one with nitre in excess; it serves for making golden showers." When this substance is lightly mixed with gunpowder and put into cases, it throws out small stars resembling the rowel of a spur; this composition has hence been called 'spur fire.' "The yellow sand, or glistening mica, communicates to fire-works golden radiations. Verdigris imparts a pale green; sulphate of copper and sal ammoniac gives a palm-tree green. Camphor yields a very white flame and aromatic fumes, which masks the bad smell of other substances. Benzoin and storax are also used, on account of their agreeable odour. Lycopodium burns with a rose colour and a magnificent flame; but it is principally employed in theatres to represent lightning, or to charge the torch of a Fury." (Ure.) See FIRES (Coloured), FLAME COLOURS, GUNPOWDER, STARS, ROCKETS, &c.

PYROXYLIC SPIRIT. See SPIRIT (Pyroxylic).

PYROXYLIN. *Syn.* FULMINATING COTTON, GUN-COTTON. A highly inflammable and explosive compound, discovered by Schönbein. It is obtained by the action of nitric acid on cotton (cellulin, $C_6H_{10}O_5$), in the presence of sulphuric acid.

By varying the strength of the nitric acid three kinds of gun-cotton may be obtained, called respectively mononitro-cellulin [$C_6H_5(NO_2)O_5$], dinitro-cellulin [$C_6H_5(NO_2)_2O_5$], and trinitro-cellulin [$C_6H_5(NO_2)_3O_5$]. The first is but slightly explosive; the second is not sufficiently explosive to be used as a substitute for gunpowder, but is best adapted for the preparation of collodion; the third is highly explosive, and is the variety employed in mining and military operations, &c.

Prep. 1. (B. P. DINITRO-CELLULIN.) Cotton-wool, 1; sulphuric acid, 5; nitric acid, 5; mix the acids, immerse the cotton, and stir with a glass rod for three minutes, or until it is thoroughly wetted, then remove it, and thoroughly wash out the acid, so that the washings cease to produce a precipitate with chloride of barium. Drain on filtering paper, and dry in a water bath. *Used in the preparation of COLLODION.*

2. Concentrated nitric acid (sp. gr. 1.500) and concentrated sulphuric acid (sp. gr. 1.845) are mixed together in about equal measures; when the mixture has become cold, it is poured into a glass or wedgwood-ware mortar or basin, and clean, dry carded cotton, in as loose a state as practicable, is immersed in it for 4 or 5 minutes, the action of the liquid being promoted by incessant stirring with a glass rod; the acid is next poured off, and the cotton, after being squeezed as dry as possible, by means of the glass stirrer, or between two

plates of glass, is thrown into a large quantity of clean soft water, and again squeezed to free it from superfluous moisture; it is then washed in a stream of pure water until it becomes perfectly free from acid, and is, lastly, carefully dried by the heat of hot water or steam, at a temperature not higher than about 180° Fahr.

3. (Schönbein.) Nitric acid (1.45 to 1.50), 1 part; sulphuric acid (1.85), 3 parts; (both by volume;) proceed as above, but, after the cotton has been squeezed from the acid, allow it to remain in a covered vessel for an hour before washing it; and after washing it, dip it into a solution of carbonate of potassa, 1 oz., in pure water, 1 gal., then squeeze, and partially dry it; next dip it into a weak solution of nitre, and dry it in a room heated by hot air or steam to about 150° Fahr. (See Patent Specif.)

4. (Von Lenk.) The cotton, having been thoroughly cleansed and dried, is steeped, as above, in a mixture of nitric and sulphuric acids (the strongest obtainable in commerce), squeezed as dry as possible, and immersed in a fresh mixture of strong acids, being allowed to remain in this second mixture 48 hours. It is then washed in a stream of water for several weeks, and finally treated with a solution of silicate of potassa (soluble glass). This is the celebrated Austrian gun-cotton which was reported on so favourably by a committee of the British Association in 1863. The treatment with silicate of potassa is adopted merely for the purpose of retarding the combustion.

5. ('Bulletin de St. Pétersbourg.')—*a.* Take of powdered nitre, 20 parts; sulphuric acid (1.830 to 1.835), 31 parts; dissolve in a glass vessel, and, whilst the solution is still warm (122° Fahr.), add of dry carded cotton, 1 part, and employ agitation until this last is well saturated; then cover over the vessel with a plate of glass, and let it stand, for 24 hours, at a temperature of about 86° Fahr.; next well wash the cotton, as above, first with cold and afterwards with boiling water, and dry it carefully at a very low temperature.

b. From sulphuric acid (containing 3 equiv. of water), 13 parts; nitric acid (monohydrated), 12 parts; carded cotton, 1 part; the immersion being limited to one hour at a temperature of from 104° to 122° Fahr. (See 'Pharm. Journ.,' vol. xiii, No. 2.)

Prop., &c. Pyroxylin explodes, with a very sudden flash, and the development of very little heat, without either smoke or residue, at a temperature of about 300° Fahr. (No. 3 at 277° Fahr.). Several modifications of pyroxylin are known, varying considerably in composition, though they all contain the elements of hyponitric acid, and are all explosive. Some are insoluble in a mixture of ether and alcohol, whilst others are readily dissolved, forming the glutinous solution which is used in surgery under the name of 'collodion,' and which is also extensively used in photography. The

best gun-cotton (Von Lenk's) is of no use whatever for making collodion. The pyroxilin prepared by the formula 5, *a* (*above*), is soluble in a mixture of 7 parts of ether and 1 part of alcohol; whilst the product of 5, *b*, if prepared by 2 hours' digestion instead of 1, is said to be even soluble in absolute alcohol.

Obs. General von Lenk has overcome all the difficulties which have hitherto prevented gun-cotton being used in place of gunpowder. By spinning the gun-cotton into thread or yarn, and weaving this into webs, he has succeeded in making cartridges which will produce the exact amount of force required. The time needed for the complete ignition of the cartridge can be diminished or increased at pleasure by varying the mechanical arrangement of the spun threads. Each gun and each kind of projectile requires a certain density of cartridge. In general, it is found that the proportion of 11 lbs. of gun-cotton occupying 1 cubic foot of space produces a greater force than gunpowder of which from 50 to 60 lbs. occupies the same space, and a force of the nature required for ordinary artillery. See COLLODION and XYLOIDIN; consult also Abel's researches in the 'Transactions of the Royal Society.'

QUACK MEDICINES. See PATENT MEDICINES, OINTMENT, PILLS, &c.

QUAIL. The *Coturnia vulgaris*, a gallinaceous bird, allied to the partridge, but of smaller size. Its flesh is highly esteemed by epicures. It is imported from Turkey, preserved in oil; and from Italy, potted with clarified butter.

QUARTAN. Occurring every fourth day.

QUARTATION. The practice, among assayers, of alloying 1 part of gold with 3 parts of silver; before submitting it to the operation of 'parting'; in order that its particles may be too far separated to protect the copper, lead, palladium, silver, or other metals, with which it is contaminated, from the solvent action of the nitric or sulphuric acid, as the case may be. See ASSAYING.

QUARTZ. Pure native silica. It is an essential constituent of granite and many other rocks. Its crystalline, transparent varieties are known as rock crystal. See GLASS, POWDER, &c.

QUASS. *Syn.* POSCA VENALIS, L. *Prep.* Mix rye-flour and warm water together, and keep the mixture by the fireside until it has turned sour. *Used* as vinegar in Russia.

QUASSIA. *Syn.* QUASSIA (Ph. L. E. & D.; QUASSIA LIGNUM, QUASSIA WOOD, B. P.) The "wood of *Pierena* (*Pierasma*) *excolet*, Lindl." (B. P., Ph. L.), or *Jamaica quassia*; and also of the "*Quassia amara*, Linn." (Ph. E.), or *Surinam quassia*. The latter is the original quassia, but it is no longer imported. Quassia is characterised by its intense bitterness. It is reputed tonic and stomachic, assisting digestion, and giving tone and vigour

to the system. Its name was given to it by Linnæus, in honour of a negro slave who had long employed it as a remedy for the malignant endemic fevers of Surinam. When sliced, it forms the 'quassia chips' of the shops. It is generally taken in the form of infusion. This last, sweetened with sugar, forms a safe and effective poison for flies.—*Dose.* (In powder) 10 to 20 grs.

ROASTED QUASSIA, reduced to powder, is largely employed, instead of hops, to embitter porter; and the unroasted powder is used for the same purpose in the adulteration of the bitter varieties of ale.

QUASSIN. *Syn.* QUASSITE, QUASSINA. A peculiar bitter principle, obtained by precipitating decoction of quassia with milk of lime, evaporating the filtrate, dissolving the residue in alcohol, treating with animal charcoal, again evaporating, dissolving in water, and crystallising. 8 lbs. of quassia chips yield 1 drachm.

QUEEN'S BLUE. Thumb blue. See BLUE.

QUEEN'S MET'AL. A species of pewter used for teapots, &c., made by fusing under charcoal a mixture of tin, 9 parts, and antimony, bismuth, and lead, of each, 1 part; or, tin, 100 parts; antimony, 8 parts; copper, 4 parts; bismuth, 1 part. See BRITANNIA METAL and PEWTER.

QUEEN'S YEL'LOW. Subsulphate of mercury.

QUER/CITRON. The bark of *Quercus nigra* or *tinctoria*, a species of oak indigenous in North America. With alum mordants it yields a very permanent yellow dye.

QUICK/SILVER. See MERCURY.

QUILLS. *Prep.* 1. The quills or wing-feathers of the goose (goose quills) are separately plunged, for a few seconds, into hot ashes, cinders, or sand, of a temperature about equal to that of boiling water, after which they are scraped with a blunt knife, strongly rubbed with a piece of flannel or woollen cloth, and gently 'stoved'; they are, lastly, tied up in bundles by women or children. A yellow tinge is often given to them by dipping them for a short time into dilute hydrochloric or nitric acid, or into an infusion of turmeric.

2. Suspend the quills in a copper over water sufficiently high to nearly touch the nibs; then close it, steam tight, and apply three or four hours' hard boiling; next, withdraw the quills, and dry them, and in 24 hours cut the nibs and draw out the pith; lastly, rub them with a piece of cloth, and expose them to a moderate heat in an oven or stove. Quills prepared in this way are as hard as bone, without being brittle, and nearly as transparent as glass. Crow quills and swan quills may be cured in the same manner.

QUINA. See QUININE.

QUINCE. *Syn.* CYDONIA, L. The fruit of *Cydonia vulgaris*, or common quince tree. Its flavour in the raw state is austere, but it forms an excellent marmalade (quince marmalade).

lade), and its juice yields an agreeable and wholesome wine. The seed or pips (*cydoniæ semina*; *cydonium*—Ph. L.) abound in gummy matter, which forms a mucilage with water, and possesses the advantage of not being affected by the salts of iron or alcohol. See DECOCTION, FIXATURE, and JELLY.

QUINICINE. An alkaloid obtained in 1853 by Pasteur, by exposing quinine or quinidine, under favourable circumstances, to a temperature varying from 248° to 266° Fahr., for several hours. It is very probable that this alkaloid is either identical, or in very close connection, with the amorphous alkaloid soluble in ether which occurs in all barks, and particularly in the young barks of the plantations in India.

QUINIDINE. $C_{20}H_{24}O_2N_2 \cdot 2Aq$. *Syn.* QUINIDIA, CONCHININE, &c. An alkaloid contained in many species of cinchona, together with quinine and cinchonine, and therefore often found in the mother-liquors of quinine manufacturers. It is identical with the β quinine of Van Heyningen, and was discovered, in 1833, by Henry and Delondre. As the cinchonidine discovered by Winckler, in 1848, has been unhappily denominated quinidine by this chemist, there is still a confusion about these alkaloids, and, therefore, the quinidine of commerce was very often a mixture of both, till Pasteur made, in 1853, a classical investigation of this matter. He maintained the name of quinidine for the alkaloid discovered by Henry and Delondre, because it is isomeric with quinine, and gives the same green colour when treated with chlorine followed by ammonia, and gave the name of cinchonidine to the alkaloid discovered by Winckler, because it is isomeric with cinchonine. He determined also the action of the solutions of these alkaloids on the plane of polarization, and found that the quinidine turned this plane to the right, its molecular rotation in alcoholic solution being $[\alpha] = 250.75^\circ \ggggg \rightarrow$, whilst he found that the cinchonidine turned this plane to the left, its molecular rotation in alcoholic solution being $[\alpha] = 144.61^\circ \lllll \leftarrow$.

Prop. &c. Many of the salts of quinidine are very similar to those of quinine, but the normal salt with hydriodic acid is not only very different from that of quinine, but also from those of all the other cinchona-alkaloids. The normal hydriodate of quinidine is so very sparingly soluble in water that 1 part requires, at 60° Fahr., not less than 1200 parts of water to be dissolved. Therefore the presence of sulphate of quinidine in the sulphate of quinine, which often occurs, either from that article being carelessly made or from wilful adulteration, can be easily detected by adding a few minims of solution of iodide of potassium to the saturated solution of sulphate of quinine in water of 60° Fahr., whereby, if quinidine is present, its hydriodate will be separated either

in the shape of a sandy precipitate or, if only traces are present, in the shape of striae on the sides of the glass where this has been rubbed by a glass rod.

For an account of its medicinal properties, the reader should consult the recent report from India upon the experiments made there by order of Government with all the four cinchona-alkaloids, which experiments are very favourable to the therapeutic action of quinidine compared with that of quinine.

QUININE. $C_{10}H_{13}ON$. *Syn.* QUINA, QUINIA. Till recently it was found in the greatest quantity in good Calisaya bark, particularly in that from Bolivia, but since it has been found in great quantity in some other barks, especially in the bark of *Cinchona officinalis*, for instance in the bark of that species grown in Ceylon. Red bark contains not only quinine and cinchonine, but also cinchonidine.

Prep. 1. By precipitating a solution of sulphate of quinine with a slight excess of ammonia, potassa, or soda, and washing and drying the precipitate. By solution in alcohol, sp. gr. .815, and spontaneous evaporation, it may be procured in crystals. Crystals may also be obtained from "its solution in hot water with a little ammonia." (Liebig.)

2. (Direct.) By adding hydrate of lime, in slight excess, to a strong decoction of the ground bark made with water acidulated with sulphuric acid, washing the precipitate which ensues, and boiling it in alcohol; the solution, filtered while hot, deposits the alkaloid on cooling.

Prop., &c. Quinine, when prepared by precipitation, is an amorphous white powder, but when this precipitate is left in the liquor it assumes, after some time, the appearance of aggregated crystalline needles; when slowly crystallised from its solution, these needles are remarkably fine, and of a pearly or silky lustre. It is freely soluble in rectified spirit and in ether, and of all the cinchona-alkaloids it is the most soluble in ammonia. It is upon this fact that Kerner's method for testing the purity of sulphate of quinine is founded. Its normal salts, if dissolved in water, have a slightly alkaline reaction upon red litmus paper. It is only sparingly soluble in water, even when boiling; both the fixed and volatile oils dissolve it with the aid of heat, more especially when it has been rendered anhydrous, or is presented to them under the form of an ethereal solution. It fuses by a gentle heat, without decomposition; forms crystallisable salts, which are only slightly soluble in water, unless it be acidulated, and, like the pure alkaloid, are extremely bitter, and possess much of the characteristic flavour of cinchona bark. It is precipitated by the alkalies and their carbonates, by tannic acid, and by most astringent substances.

Pur. See SULPHATE OF QUININE, and QUINOMETER (below).

Tests. Quinine is recognised by—1. Its appearance under the microscope.—2. Its solubility in ether, and in pure ammonia water.—3. Its solubility in concentrated nitric acid, forming a colourless liquid, which does not become yellowish until it is heated.—4. The solubility of itself and salts, when pure, in concentrated sulphuric acid, forming colourless fluids, “which do not acquire any coloration upon being heated to the point of incipient evaporation of the sulphuric acid, but which afterwards become yellow, and finally brown.” (Fresenius).—5. Its solubility in concentrated sulphuric acid to which some nitric acid has been added, forming a colourless, or, at the most, only a faintly yellowish liquid.—6. It is wholly destroyed by heat.

A solution of quinine in acidulated water, and solutions of its salts, exhibit the following reactions:—1. Ammonia, potassa, and the alkaline carbonates, give white, pulverulent precipitates, becoming crystalline after some time (see *above*), and which are soluble in ammonia in excess, and which, when ether is added after the ammonia, and the whole is agitated, redissolve in the ether, whilst the clear liquid, on repose, presents two distinct layers.—2. Bicarbonate of soda (avoiding excess) gives a similar precipitate, both in acid and neutral solutions of quinine, either at once or after a short time. This precipitate is soluble in excess of the precipitant, and is again precipitated from the new solution upon protracted ebullition. “Vigorous stirring of the liquid promotes the separation of this precipitate.” (Fresenius).—3. If recently prepared chlorine be added to it, and then ammonia, a beautiful emerald-green colour is developed. (Ph. L.).—4. A concentrated solution of ferrocyanide of potassium being added, in excess, after the chlorine, instead of the ammonia, a dark red colour is instantly produced, which, after some time, passes into green, especially when freely exposed to the light. This reaction is not characteristic of quinine, for with quinidine one gets the same reaction.—5. If caustic potassa be used instead of ammonia (see *above*), the solution acquires a sulphur-yellow colour. “These reactions are restricted to this alkaloid.” (Dr. Garrod.)

The best test, however, for quinine is the formation of its iodosulphate, the so-called herapathite. For this purpose the quinine is dissolved in 10 parts of proof spirit, acidulated with $\frac{1}{10}$ th part of sulphuric acid, and to this solution an alcoholic solution of iodine is carefully added, and the liquid in the meanwhile stirred with a glass rod. There appears, either immediately or after some minutes, a black precipitate of iodosulphate of quinine, which, if redissolved in boiling proof spirit, forms in cooling the beautiful crystals of herapathite. 100 parts of this herapathite, if dried on a water bath, represent 56·5 parts of pure quinine.

Quinine is distinguished from both cinchonine and quinidine by its comparatively free

solubility in ether; the last of these being very sparingly soluble, and the other wholly insoluble, in that menstruum. The presence of cinchonine may also be positively determined by reference to the behaviour of that alkaloid. Quinidine is also distinguished from quinine by the different crystallisation, greater specific gravity, and freer solubility of its salts in cold water.¹

Estim. See QUINOMETRY.

Uses, &c. Pure quinine is but rarely used in medicine, but several of its salts are employed as remedies, on account of their great stimulant, tonic, and febrifuge powers. As a tonic in dyspeptic affections, and for restoring strength and vigour to morbidly weakened habits, and as an antiperiodic or agent to counteract febrile action, it appears to be superior to all other remedies, provided no abnormal irritability of the mucous membranes, or of the circulatory organs, exists. The dose of the salts of quinine, as a tonic, is $\frac{1}{2}$ to 1 gr., twice or thrice daily; as an antiperiodic, 2 to 5 grs., or even more, every second or third hour, during the intervals of the paroxysms of ague, and of other intermittent or periodic affections; also in acute rheumatism. The sulphate (disulphate) is the salt generally used; this and other salts are most effective when taken in solution.

The salts of quinine may be made by simply saturating the dilute acids with the base, so that part of the latter remains undissolved, and gently evaporating the solutions for crystals, or to dryness. Prince Lucien Bonaparte recommends all these salts to be prepared by the addition of a strong alcoholic solution of quinine to a cold solution of the acid. We have tried this method with success.

Quinine, Ac'etate of. *Syn.* QUINÆ ACETAS, L. *Prep.* 1. (P. Cod.) Mix quinine, 2 parts, with water, 3 parts; heat the mixture, and add of acetic acid, q. s. to dissolve the alkaloid, and to render the solution slightly acid; lastly, decant or filter the solution whilst boiling hot, and set it aside to crystallise. The mother-water, on evaporation, will yield a second crop of the acetate.

2. Effloresced sulphate of quinine, 17 parts, is dissolved in boiling water, and mixed with crystallised acetate of soda, 6 parts. The acetate of quinine crystallises.

Prop., &c. Satiny, acicular crystals, which are rather more soluble in water than those of the sulphate.—*Dose.* $\frac{1}{2}$ to 5 grs.

Quinine, Arse'niate of. *Syn.* QUINÆ ARSENIAS, L. *Prep.* (Bourrières.) Arsenic acid, 1½ dr.; quinine, 5 drs.; distilled water, 6 fl. oz.; boil them together in a covered glass vessel until the alkaloid is dissolved, then set the solution aside to crystallise.

Uses, &c. Recommended by Dr. Neligan,

¹ An extremely elegant and highly sensitive method of testing for quinine and quinidine by means of the microscope, &c., is described at considerable length, by Dr. Herapath, in the ‘Pharm. Journ.’ for November, 1853.

and others, as being more powerfully antiperiodic than the other preparations of quinine.

—*Dose.* $\frac{1}{16}$ to $\frac{1}{4}$ gr., made into pills; in agues, neuralgia, &c.; also in cancer.

Quinine, Arsenite of. *Syn.* QUINÆ ARSENIS, L. *Prep.* Sulphate of quinine, 100 parts, is dissolved in alcohol, 600 parts, and boiled with arsenious acid, 14 parts. The liquid is then filtered. The poisonous salt is deposited in the crystalline form as the liquid cools.

Uses, &c. As the last.

Quinine, Chloride of. Hydrochlorate of quinine (see *below*).

Quinine, Citrate of. *Syn.* QUINÆ CITRAS, L. *Prep.* 1. By mixing a hot solution of sulphate of quinine with a like solution of citrate of soda.

2. From quinine and citric acid, as the acetate. Needle-shaped prisms.—*Dose, &c.* As the sulphate or disulphate.

Quinine, Disulphate of. Sulphate of quinine (see *below*).

Quinine, Ferrocyanide of. *Syn.* CYANIDE OF IRON AND QUININE; QUINÆ HYDROFERROCYANAS, QUINÆ FERRO-PRUSSIAS, L. *Prep.* (P. Cod.) Sulphate of quinine, 100 parts; ferrocyanide of potassium, 31 parts; distilled water, 2500 parts; boil for a few minutes, and, when cold, separate the impure salt which floats as an oily mass on the surface, wash it with a little cold water, and dissolve it in boiling alcohol; the solution will deposit crystals as it cools.

Obs. This compound is by some said to be the most efficacious of all the salts of quinia. Pelouze asserts that it is simply quinine mixed with some Prussian blue.—*Dose.* 1 to 6 grs.

Quinine, Ferrosulphate of. See SULPHATE OF QUININE AND IRON (*below*).

Quinine, Hydriodate of. *Syn.* IODIDE OF QUININE; QUINÆ HYDRIODAS, Q. IODIDUM, L. *Prep.* 1. By adding, drop by drop, a concentrated solution of iodide of potassium to a like solution of acid sulphate of quinine, and drying the precipitate in the shade; or, heat the liquid nearly to the boiling-point, and allow it to crystallise.

2. (Parrish.) Effloresced sulphate of quinine, 5 parts, dissolved in alcohol, and decomposed by an alcoholic solution of 3 parts of iodide of potassium, precipitates sulphate of potassium, and yields, on cooling and evaporating, hydriodate of quinine in fine crystalline needles.

3. (IODURETTED — Bouchardat.) From an acid solution of quinia and a solution of iodide of iron containing a slight excess of iron, as No. 1.

Obs. The above are reputed alterative, tonic, and antiperiodic.—*Dose.* 1 to 4 grs.; in obstinate intermittents, and in the scrofulous affections of debilitated subjects.

¹ "1 and 2 are not identical, 1 is an acid salt which readily crystallises, but 2 is a normal salt which I never saw crystallise, but always like a fluid resin, quite amorphous."—De Vrij.

Quinine, Hydrochlorate of. *Syn.* CHLORIDE OF QUININE, MURIATE OF QUININE †; QUINÆ HYDROCHLORAS, QUINÆ MURIAS, L. *Prep.* 1. By neutralising dilute hydrochloric acid with the base, as above.

2. (Ph. Bor.) Chloride of barium, 5 drs.; boiling water, 1 lb.; dissolve, add, gradually, of sulphate of quinine, 2 oz.; boil gently for a few minutes, filter the solution whilst hot, and set it aside that crystals may form.

3. (QUINÆ MURIAS—Ph. D.) Dissolve chloride of barium, 123 grs., in distilled water, 2 fl. oz.; add of sulphate of quinine, 1 oz., dissolved in boiling water, 1½ pint; mix, evaporate the solution to one half, filter, and again evaporate until spiculae begin to appear; next allow the liquid to cool, collect the crystals, and dry them on bibulous paper. The mother-liquor, by further concentration and cooling, will yield an additional product.

Obs. Hydrochlorate of quinine occurs in snow-white groups of feathery crystals, of a mother-of-pearl lustre, which are more freely soluble than those of the disulphate.

Quinine, Kininate of. *Syn.* QUINÆ KINAS, L. *Prep.* By saturating a solution of kinic acid with quinine, and purifying by crystallisation out of alcohol. The kinate of quinine is obtained in crystalline warts, soluble in 4 parts of water and 8 parts of alcohol.

Quinine, Lactate of. *Syn.* QUINÆ LACTAS, L. *Prep.* As the ACETATE or CITRATE. By spontaneous evaporation fine crystals may be obtained. Said to agree better with dyspeptic patients than the other salts of quinine.

Quinine, Muriate of. Hydrochlorate of quinine (see *above*).

Quinine, Nitrate of. *Syn.* QUINÆ NITRAS, L. *Prep.* As the HYDROCHLORATE, substituting dilute nitric acid, or nitrate of baryta (P. Cod.), for hydrochloric acid or chloride of barium.

Quinine, Phosphate of. *Syn.* QUINÆ PHOSPHAS, L. As the ACETATE. Silky, needle-shaped crystals, with a pearly lustre. It has been highly recommended in intermittents, &c., associated with rickets and stomach affections.

Quinine, Sulphates of. The salt often called 'disulphate of quinine' is now generally regarded as the normal sulphate, while the soluble salt often called the 'neutral sulphate,' is considered to be an acid salt. This change in nomenclature results from doubling the atomic weight of the alkaloid quinine:—

1. **Quinine, Acid Sulphate of.** ($C_{20}H_{24}N_2O_2 \cdot H_2SO_4 \cdot 7Aq$). *Syn.* SULPHATE OF QUININE †, NEUTRAL SULPHATE OF QUININE †, SOLUBLE S. OF Q.; QUINÆ SULPHAS SOLUBILIS, L. *Prep.* From sulphate of quinine, 1 oz., dissolved, by the aid of heat, in water, ½ pint, previously acidulated with dilute sulphuric acid, 5 fl. drs.; the solution affords crystals on cooling, and more on evaporation.

Obs. This salt possesses the advantage of being soluble in about 10 parts of water at

60° Fahr.; but it is seldom used in the crystalline form; still, as the officinal sulphate ('disulphate') is generally prescribed along with a small quantity of dilute sulphuric acid to render it soluble, this acid sulphate is, in fact, the compound which is commonly given. It is the 'bisulphate,' 'supersulphate,' or 'acid sulphate of quina' of Soubeiran and other Continental chemists.

2. Quinine, Sulphate $\frac{3}{4}$ l. ($C_{20}H_{24}N_2O_2$). $2H_2SO_4$ (7Aq). *Syn.* NORMAL SULPHATE OF QUININE, DISULPHATE OF Q., QUININE; QUININE DISULPHAS (Ph. L.), QUININE SULPHAS (Ph. E., D., & U. S., & P. Cod.), QUININE SULPHAS (B. P.), L.; SULPHATE DE QUININE, Fr. *Prep.* 1. (Ph. L. 1836.) Take of yellow cinchona bark, bruised, 7 lbs.; sulphuric acid, 4½ oz.; (diluted with) water, 6 galls.; boil them for 1 hour, and strain; repeat this a second time for 1 hour, with a like quantity of acid and water, and again strain; next boil the bark for 3 hours, in water, 8 galls., and strain; wash the residue with fresh quantities of boiling distilled water; to the mixed decoctions and washings, add moist hydrated oxide of lead to saturation, decant the supernatant fluid, and wash the sediment with distilled water; boil down the liquor for 15 minutes, and strain, then precipitate the quina with liquor of ammonia, and wash the precipitate (with very cold water) until nothing alkaline is perceptible; saturate what remains with sulphuric acid, ½ oz., diluted with water, q. s., digest with animal charcoal, 2 oz., and strain; lastly, the charcoal being well washed, evaporate the mixed liquors, that crystals may form.

2. (Ph. E.) This process varies from the last one, in the bark (1 lb.) being first boiled in water (4 pints) along with carbonate of soda (4 oz.); the residuum, being pressed, is moistened with water, and again pressed, and this operation is repeated a second and a third time, the object being to remove, as much as possible, the acids, colouring matter, gum, and extractive, before proceeding to extract the alkaloid. Carbonate of soda is also used as the precipitant, instead of ammonia, and the precipitate is formed into a sulphate (disulphate) by being stirred with boiling water, 1 pint, to which sulphuric acid, 1 fl. scruple, or q. s., is subsequently added. The crystals, after digestion with prepared animal charcoal, 2 drs., are ordered to be dried at a heat not higher than 140° Fahr.

3. (Ph. D.) Yellow bark, 1 lb., is macerated for 24 hours in water, 2 quarts, acidulated with oil of vitriol, 2 fl. drs., and then boiled for half an hour, after which the fluid is decanted; this is repeated a second and a third time with water, 2 quarts, and oil of vitriol, 1 fl. dr.; the decanted (or strained) liquors are evaporated to a quart, and filtered, and slaked lime, 1 oz., or q. s., added to the solution until it exhibits a decidedly alkaline reaction; the precipitate is next collected on a calico filter, and, after having been washed with cold water,

partially dried on porous bricks, and subjected to powerful pressure enveloped in blotting paper, is boiled for 20 minutes in rectified spirit, 1 pint, and the liquid, after subsidence, decanted; this is repeated a second and a third time with a fresh pint of spirit, and the residuum being well pressed, the mixed liquors are filtered, and the spirit removed by distillation; the brown viscid residuum is dissolved in boiling water, 16 fl. oz., boiled, and dilute sulphuric acid, ½ fl. oz., or q. s., added to render the solution neutral or only slightly acid; animal charcoal, ½ oz., is next stirred in, the mixture boiled for about 5 minutes, filtered, and set aside to crystallise; the crystals are dried on blotting paper, by mere exposure to a dry atmosphere.

4. (B. P.) Yellow cinchona bark, in coarse powder, 16; hydrochloric acid, 3; distilled water, a sufficiency; solution of soda, 80; dilute sulphuric acid, a sufficiency. Dilute the hydrochloric acid with ten pints of the water. Place the bark in a porcelain basin, and add to it as much of the diluted hydrochloric acid as will render it thoroughly moist. After maceration, with occasional stirring, for twenty-four hours, place the bark in a displacement apparatus, and percolate with the diluted hydrochloric acid until the solution which drops through is nearly destitute of bitter taste. Into this liquid (hydrochlorate of quinine) pour the solution of soda, agitate well, let the precipitate (quinine) completely subside, decant the supernatant fluid, collect the precipitate on a filter, and wash it with cold distilled water until the washings cease to have colour. Transfer the precipitate to a porcelain dish containing a pint of distilled water, and, applying to this the heat of a water bath, gradually add diluted sulphuric acid until *very nearly* the whole of the precipitate has been dissolved, and a neutral liquid has been obtained. (Or add about half the precipitated quinine to some water in an evaporating basin, warm the mixture and pour in diluted sulphuric acid until the precipitate has dissolved and the liquid is neutral or only faintly acid, then add the other half, stir well, and again heat liquid.) Filter the solution (sulphate of quinine), while hot, through paper, wash the filter with boiling distilled water, concentrate till a film forms on the surface of the solution, and set it aside to crystallise. The crystals should be dried on filtering paper without the application of heat.

5. "Those who are well acquainted with the chemistry of the cinchona-alkaloids all agree with me in condemning the boiling of bark with dilute acids. I prefer the following method, which can also be used on a small scale for quinometry.

"Yellow bark, or any other bark in which quinine prevails, like, for instance, that of *Cinchona officinalis*, 1 lb., is mixed with milk of lime, made from 4 oz. of lime and 40 oz. of water. After drying this mixture it is ex-

hausted with strong methylated spirit (the strongest possible) and the slightly coloured solution neutralised with sulphuric acid, so that the liquor has a slight acid reaction upon blue litmus paper. After filtering or subsiding, the clear liquid is distilled and the residue in the still dissolved in water, carefully neutralised, so that the solution has a slight alkaline reaction upon red litmus paper, treated with charcoal and crystallised, &c."—De Vrij.

6. ('HOSPITAL SULPHATE'—Mr. E. Herring.) The crushed bark is boiled in a solution of caustic soda or potassa, to extract colouring matter and gum; it is then pressed, washed with cold water, a second time boiled with a solution of caustic alkali, and again pressed, washed, and pressed; the decoloured and purified bark is next exhausted by coction with acidulated water, in the usual way, and the filtered mixed decoctions are precipitated with carbonate of soda; the precipitated quina is then dissolved in hot dilute sulphuric acid, to saturation, when the 'HOSPITAL SULPHATE' crystallises out, as the solution cools; this is, lastly, washed with a little cold water, drained, and dried.—The advantage of this process is the non-use of animal charcoal as a bleacher, and the consequent less cost of the product. In the preparation of his 'WHITE SULPHATE,' Mr. Herring uses benzol as a solvent, instead of alcohol. *Patent* dated July 28th, 1853. .

Prop. When pure, sulphate of quinine forms very light, delicate, flexible, white needles, which are efflorescent, inodorous, and intensely bitter; it is soluble in 740 parts of water at 60°, and in 30 parts at 212° Fahr.; it takes about 80 parts of cold rectified spirit for its solution, but is freely soluble in boiling alcohol, and in acidulated water; it melts at 240° Fahr., and is charred and destroyed at a heat below that of redness. The crystals contain 76.1% of quinine, 8.7% of sulphuric acid, and 15.2% of water; of the last, they lose about 3-4ths by exposure to dry air, and nearly the whole when kept in a state of fusion for some time.

Pur. This may not be inferred from the form of its crystallisation, for the sulphates of quinidine and of cinchonidine may be obtained in the same form of crystallisation. As mentioned already, the reaction with chlorine and ammonia does not distinguish quinine from quinidine, as both give the same green colour. "It is entirely soluble in water (hot), and more readily so when an acid is present. Precipitated by ammonia, the residuary liquid, after evaporation, should not taste of sugar. By a gentle heat it loses 8 or 10% of water. It is wholly consumed by heat. If chlorine be first added, and then ammonia, it becomes green." (Ph. L. 1836.) "On adding chloride of barium to 100 grs. of this salt, dissolved in water mixed with hydrochloric acid, 26.6 grs. of sulphate of baryta, dried at a red heat, are prepared." (Ph. L. 1851.) "A solution of 10 grs., in 1 fl. oz. of distilled water, and 2 or

3 drops of sulphuric acid, if decomposed by a solution of $\frac{1}{2}$ oz. of carbonate of soda, in two waters, and heated until the precipitate shrinks and fuses, yields, on cooling, a solid mass, which, when dry, weighs 7.4 grs., and when reduced to powder, dissolves entirely in a solution of oxalic acid." (Ph. E.)

Adult. Sulphate of quinine is said to be often adulterated with starch, magnesia, gum, sugar, cinchonine, quinidine, &c.; but according to De Vrij, those with starch, magnesia, gum, and sugar, are very rare, if ever they were really observed. Very frequent are those with the sulphates of the other cinchona-alkaloids, and these become even still more frequent, as very different kinds of bark are used for the manufacture of quinine. Salicine is, if ever, but very seldom used for adulteration of quinine. The best practical test for the purity of sulphate of quinine is the following:—A saturated solution of the salt is made at 60° Fahr., and one part of this solution is mixed with 2 or 3 minims of a concentrated solution of iodide of potassium, whilst another part is mixed with 2 or 3 minims of a concentrated solution of tartrate of potash and soda. If the sulphate of quinine is pure its solution will remain unaltered by both reagents, even after rubbing the sides of the test tube with a glass rod and standing many hours. But if it contains one or more of the other cinchona-alkaloids there will appear either precipitates or striae on the glass where it has been rubbed by the glass rod. Iodide of potassium indicates particularly the presence of even traces of quinidine, but also of cinchonidine and cinchonine, provided their quantity be not too small. Tartrate of potash and soda indicate, under these circumstances, only the presence of cinchonidine. The first three remain undissolved when the salt is digested in spirit; the fourth is dissolved out by cold water; the fifth may be detected by its total insolubility in ether; or, by precipitating the quinine by solution of potassa, and dissolving the precipitate in boiling alcohol; cinchonine crystallises out as the solution cools, but the quinine remains in the mother-liquor; and the last, by the greater solubility and sp. gr. of the salt, &c. If the sample disengages ammoniacal fumes when treated with liquor of potassa, it contains sal ammoniac. The presence of most foreign organic substances is also shown by the sample being turned brown, and being soon charred when treated with a drop of concentrated sulphuric acid. If it turn red it contains salicin, a substance which is now frequently used to adulterate sulphate of quinine. The pure sulphate is not discoloured by this reagent.

Uses, &c. The sulphate is more extensively employed than any of the other salts of quinine, and, indeed, to almost the exclusion of them. It is the article intended to be used whenever 'sulphate' or 'disulphate' of quinine, or even 'quinine,' is ordered for medicinal purposes,

unless the name is qualified by some other term. It is a most valuable stomachic, in doses of $\frac{1}{4}$ to 1 gr.; as a tonic, 1 to 3 grs.; and as a febrifuge, 2 to 20 grs.

Quinine, Sulpho-tar'trate of. *Syn.* QUINÆ SULPHO-TARTRAS, L. *Prep.* From sulphate of quinine, 4 parts; tartaric acid, 5 parts; distilled water, 20 parts; mix, gently evaporate to dryness, and powder the residuum.

Quinine, Tan'nate of. *Syn.* QUINÆ TANNAS, L. *Prep.* Dissolve sulphate of quinine in slightly acidulated water, and add a solution of tannic acid as long as a precipitate forms; wash this with a little cold water, and dry it. The Ph. Græca orders infusion of galls to be used as the precipitant. In intermittent neuralgia.

Quinine, Tar'trate of. *Syn.* QUINÆ TARTRAS, L. *Prep.* (P. Cod.) From tartaric acid and quinine, as the acetate.

Quinine, Vale'rianate of. *Syn.* QUINÆ VALERIANAS (Ph. D.), L. *Prep.* 1. As the acetate or citrate.

2. (Ph. D.) Valerianate of soda, 124 grs.; distilled water, 2 fl. oz.; dissolve; also dissolve hydrochlorate of quinine, 7 drs., in distilled water, 14 fl. oz.; next heat each solution to 120° (not higher), mix them, and set the vessel aside for 24 hours; lastly, press the mass of crystals thus obtained, and dry them, without the application of artificial heat.

Prop., &c. Silky needles and prisms; its solution suffers decomposition when heated much above 120° Fahr. It is powerfully antispasmodic, antiperiodic, and nervine.—*Dose.* $\frac{1}{2}$ gr., every two hours, or 1 to 3 grs., twice or thrice daily; in epilepsy, hemicrania, hysteria, neuralgia, and other nervous affections.

QUININE AND COD-LIVER OIL. *Syn.* COD-LIVER OIL WITH QUININE, QUINARETTED COD-LIVER OIL; OLEUM MORRHUE CUM QUINÀ, OLEUM TRECORIS ASELLI CUM QUINÀ, L. This medicine is a solution of pure anhydrous quinine in pure cod-liver oil.

Prep. 1. Pure quinine (preferably recently precipitated) is fused in a glass or porcelain capsule by the heat of an oil or sand bath, carefully applied, by which it assumes a brown colour and the appearance of a resin; it is then allowed to cool out of contact with the air, after which it is reduced to powder in a dry mortar, and added to pure pale Newfoundland cod-liver oil, gently heated in a closed glass vessel over a water bath; the solution of the alkaloid is promoted by constant agitation, and, when complete, the vessel, still corked, is set aside in a dark situation to cool; when the 'quinaretted oil' is quite cold, it is put into bottles, in the usual manner, and preserved, as much as possible, from the light and air.

2. The anhydrous quinine is dissolved in a little anhydrous ether before adding it to the oil, which in this case need not be heated, as the union is effected by simple agitation; should this not take place, it may be gently warmed for a few minutes.

3. The anhydrous quinine is dissolved in anhydrous alcohol, and after being added to the oil, the whole is gently heated, in an open vessel, by the heat of a water bath, until the alcohol is expelled; agitation, &c., being had recourse to, as in No. 1.

Prop., &c. The above preparation resembles ordinary cod-liver oil, except in having a pale yellowish colour, and a slightly bitter taste, similar to that of cinchona bark. It is said to possess all the properties of cod-liver oil combined with those peculiar to quinine, by which the tonic, stomachic, and antiperiodic qualities of the latter are associated, in one remedy, with the genial, supporting, and alterative action of the other. The common strength is 2 grs. of quinine per oz.

QUININE AND IRON. These two important medicinal agents are combined together in various ways. The following compound salts are often prescribed.

Quinine and Iron, Citrate of. *Syn.* CITRATE OF IRON AND QUININE; FERRI ET QUINÆ CITRAS, B. P. *Prep.* 1. (B. P.) Solution of persulphate of iron, $4\frac{1}{2}$; sulphate of quinia, 1; dilute sulphuric acid, $1\frac{1}{2}$; citric acid, 3; solution of ammonia and distilled water, of each, a sufficiency: mix 8 of the solution of ammonia with 40 of the water, and to this add the solution of persulphate of iron, previously diluted with 40 of the water, stirring them constantly and briskly. Let the mixture stand for two hours, stirring it occasionally, then put it on a calico filter, and when the liquid has drained away, wash the precipitate with distilled water until that which passes through the filter ceases to give a precipitate with chloride of barium. Mix the sulphate of quinia with 8 of the water, add the sulphuric acid, and when the salt is dissolved, precipitate the quinia with a slight excess of solution of ammonia. Collect the precipitate on a filter, and wash it with 30 of the water. Dissolve the citric acid in 5 of the water, and having applied the heat of a water bath, add the oxide of iron, previously well drained; stir them together, and when the oxalic acid has dissolved, add the precipitated quinia, continuing the agitation until this also has dissolved. Let the solution cool, then add, in small quantities at a time, $1\frac{1}{2}$ solution of ammonia, dilute with 2 of the water, stirring the solution briskly, and allowing the quinia, which separates with each addition of ammonia, to dissolve before the next addition is made. Filter the solution, evaporate it to the consistence of a thin syrup, then dry it in layers on flat porcelain or glass plates, at the temperature of 100° Fahr., remove the dry salt in flakes, and keep it in a stoppered bottle. Solubility, 2 in 1.—*Test.* Taste bitter as well as chalybeate. When burned with exposure to air, it leaves a residue (oxide of iron) which yields nothing to water. 50 grs., dissolved in an ounce of water, and treated with a slight excess of ammonia, gives a white precipitate (quinia) which, when collected on

a filter and dried, weighs 8 grs. The precipitate is entirely soluble in pure ether, indicating absence of quinia and cinchona. When burned it leaves no residue. When dissolved by the aid of an acid it forms a solution which, after decolorisation by a little purified animal charcoal, turns the plane of polarisation strongly to the left (cinchona turns it to the right).—*Dose.* 5 to 10 grs. as a tonic, three times a day, in solution or in pill.

2. (Ph. U. S.) Triturate sulphate of quinine, 1 oz., with distilled water, 6 fl. oz., and having added sufficient diluted sulphuric acid to dissolve it, cautiously pour into the solution water of ammonia with constant stirring, until in slight excess. Wash the precipitated quinine on a filter, and having added solution of citrate of iron, 10 fl. oz., keep the whole at a temperature of 120° by means of a water bath, and stir constantly until the alkaloid is dissolved. Lastly, evaporate the solution to the consistence of a syrup, and spread it on plates of glass, so that, on drying, the salt may be obtained in scales.—*Dose.* 2 grs. to 5 grs.

Quinine and Iron, Iodide of. *Syn.* QUINÆ ET FERRI IODIDUM, L. *Prep.* From protiodide of iron, 2 parts; hydriodate of quinine, 1 part; rectified spirit, 12 parts; heat them together, and either evaporate to dryness or crystallise by refrigeration. A powder, or crystalline scales.

Quinine and Iron, Sulphate of. *Syn.* FERROSULPHATE OF QUININE; QUINÆ FERRO-SULPHAS, QUINÆ ET FERRI SULPHAS, L. *Prep.* From solutions of the sulphates of iron and quinine, in atomic proportions, mixed whilst hot, and the crystals which form as the liquid cools carefully dried and preserved from the air.

QUININE AND MERCURY. See CHLORIDE OF MERCURY AND QUININE.

QUINOIDINE. *Syn.* AMORPHOUS QUININE, CHINOIDINE; QUINA AMORPHA, QUINA INFORMIS, QUINOIDIA, QUINOIDINA, QUINOIDINUM, CHINOIDEUM, L. A few years after the discovery of the quinine by Pelletier and Caventou, Sertuerner, a German physician, and known as the discoverer of morphia, obtained, by a peculiar method, from yellow bark, an amorphous alkaloid which was called by him Chinoïdin,¹ and also fever-killer (Fiebertödtter). He found that not only this alkaloid itself, but also all its compounds with acids, were equally amorphous. As recent investigations have proved that this amorphous alkaloid occurs in all cinchona barks, and is found particularly in many young Indian barks in great quantity, it is quite natural that in the manufacture of quinine the uncrystallisable sulphate of this alkaloid should accumulate in the mother-liquors of the sulphate of quinine. From such liquors it is precipitated in an impure state by an alkali, and brought into commerce under the name of quinoidine. As this

amorphous alkaloid has the property of preventing the crystallisation of the salts of the other alkaloids, particularly those of quinine, it is clear that the quinoidine of commerce very often contains quinine and also cinchonidine. Dr. de Vrij, for instance, found sometimes more than 20% of quinine in some samples of quinoidine of commerce. Although commercial quinoidine contains many impurities which may have their origin partly in the adulteration of the cinchona-alkaloids, unadulterated quinoidine, no doubt, chiefly consists of the amorphous alkaloid discovered by Sertuerner.

The quinoidine of commerce ought never to be used in medicine, unless purified. For this purification there are two methods. 1. That of Mr. Bullock, which gives the purer but the more expensive product. Crude quinoidine is exhausted with ether, which, after defecation, is distilled off, leaving the purified quinoidine behind. This process has been patented in England by Mr. Bullock. 2. That of Dr. de Vrij, which consists in boiling 9 parts of crude quinoidine with a solution of 2 parts of oxalate of ammonium in water. By this process the alkaloids contained in the quinoidine are dissolved, whilst the impurities, and amongst them the lime which is often contained in the crude quinoidine, remain undissolved. The solution is mixed with a large bulk of water, then filtered and the purified quinoidine precipitated by a slight excess of liquor of soda.

Prop., &c. In its crude form quinoidine somewhat resembles aloes; in its purest state it is a yellowish-brown resin-like mass, freely soluble in alcohol and ether, but nearly insoluble in water; with the acids it forms dark-coloured, uncrystallisable salts. It is powerfully febrifuge, but less so than either quinine or quinine, although it is identical in chemical composition with both of them.—*Dose.* 2 to 4 grs. for adults, $\frac{1}{2}$ to 1 gr. for children, given in wine, lemonade, or acidulated honey.

QUINOMETRY. *Syn.* CINCHONOMETRY. The art of estimating the quantity of quinine in cinchona bark, and in the commercial salts of this alkaloid.

Proc. 1. FOR BARK.—a. (Ph. E.) A filtered decoction of 100 grs. of bark, in distilled water, 2 fl. oz., is precipitated with 1 fl. dr., or q. s., of a concentrated solution of carbonate of soda; the precipitate, after being heated in the fluid so as to become a fused mass, and having again become cold, is dried and weighed. "It should be 2 grs., or more, and entirely dissolve in a solution of oxalic acid." To render the result strictly accurate, the product should be dissolved in 10 parts of proof spirit, containing $\frac{1}{10}$ th of sulphuric acid, and to this solution carefully added an alcoholic solution of iodine as long as there appears a brown precipitate, which immediately turns black by stirring with a glass rod. This precipitate, collected upon a filter, washed with strong alcohol and dried on a water bath, is Herapath's

¹ Sertuerner, 'Die neuesten Entdeckungen in der Physik, Heilkunde, und Chemie,' 3ter Band, 2tes Heft, Seite 269 (1850).

iodosulphate of quinine, of which 100 parts represent 56.5 parts of pure quinine.

b. (Rebourdain.) 100 grs. of the bark (coarsely powdered) are exhausted with acidulated water, and the filtered solution rendered alkaline with solution of potassa; it is next shaken with about 1-3rd of its volume of chloroform, and then allowed to repose for a short time; the chloroform holding the alkaloid in solution sinks to the bottom of the vessel in a distinct stratum, from which the supernatant liquid is separated by decantation; the chloroformic solution, either at once or after being washed with a little cold water, is allowed to evaporate; the residuum, when weighed, gives the per-centage richness of the sample.

Obs. A like result may be obtained with ether, instead of chloroform; in which case the solution of quinine will form the upper stratum.

c. Instead of Rebourdain's process, Dr. de Vrij prefers that of Charles,¹ so far as regards the separation of the total mixed alkaloids from the bark. To this mixture is applied the process mentioned above (a), viz. solution in acidulated proof spirit, &c.

2. For the SALTS. The above methods, as well as several others which have been devised for the purpose, may also be applied to the salts of quinine; but, unfortunately, they are inapplicable when great accuracy is required, owing to the non-recognition of the presence of quinidine, as such, and which, consequently, goes to swell the apparent richness of the sample in quinine. The following ingenious method, invented by Dr. Ure, not merely enables us to detect the presence of cinchonine and quinidine in commercial samples of the salts of quinine, but, with some trifling modifications, it also enables us to determine the quantity of each of these alkaloids present in any sample:—"10 grs. of the salts to be examined" (the sulphate is here more especially referred to) "is put into a strong test-tube, furnished with a tight-fitting cork; to this are to be added 10 drops of dilute sulphuric acid (1 acid and 5 water), with 15 drops of water, and a gentle heat applied to accelerate solution." This having been effected, and the solution entirely cooled, 60 drops of officinal sulphuric ether, with 20 drops of liquor of ammonia, must be added, and the whole well shaken while the top is closed by the thumb. The tube is then to be closely stopped, and shaken gently from time to time, so that the bubbles of air may readily enter the layer of ether. If the salt be free from cinchonine and quinidine, or contain the latter in no greater proportion than 10%, it will be completely dissolved; while on the surface, where contact of the two layers of clear fluid takes place, the mechanical impurities only will be separated. After some time the layer of ether becomes hard and gelatinous, and no further observation is possible."

¹ Journal de Pharmacie et de Chimie, 4e série, t. 12, p. 81 (Août, 1870).

"From the above statement respecting the solubility of quinidine in ether, it appears that the 10 grs. of the salt examined may contain 1 gr. of quinidine, and still a complete solution with ether and ammonia may follow; but in this case the quinidine will shortly begin to crystallise in a layer of ether. The least trace of quinidine may be yet more definitely detected by employing, instead of the ordinary ether, some ether previously saturated with quinidine, by which means all of the quinidine contained in the quinine examined must remain undissolved. It is particularly requisite, in performing this last experiment, to observe, (immediately) after the shaking, whether all has dissolved; for, owing to the great tendency of quinidine to crystallisation, it may become again separated in a crystalline form, and be a source of error."

"If more than 1-10th of quinidine or (any) cinchonine be present, there will be found an insoluble precipitate at the limits of the two layers of fluids. If this be quinidine, it will be dissolved on the addition of proportionately more ether, while cinchonine will remain unaffected."

Note. To Dr. Ure's test Dr. de Vrij prefers, for several reasons, Dr. Kerner's test, 'Zeitschrift für Analytische Chemie,' von Fresenius, 1st Jahrg. 1862; 'Ueber Die Prüfung des Käuflichen Schwefelsauren Chinins auf fremde Alkaloiden, von Dr. G. Kerner.'

QUINOVIN. $C_{20}H_{45}O_9$. Syn. CINCHOVIN, QUINOVIA.

QUINOVIN. A very bitter amorphous glucoside contained in the genus Cinchona, Nausea, and probably in many other allied genera. It is insoluble in water, very soluble in rectified spirit and in chloroform, with which last liquid it forms, in concentrated solutions, a jelly. If a current of hydrochloric gas is passed into its alcoholic solution the liquid becomes hot and the quinoevin is split up into a peculiar kind of sugar.

QUINOVIC ACID. $C_{25}H_{39}O_4$. This is insoluble in water, also in chloroform, and difficultly soluble in alcohol. It can be obtained from the boiling alcoholic solution, by cooling, in small crystals. In the leaves, bark, and wood, of the cinchona tree this acid is contained, together with quinoevin, and it is this mixture which has been recently applied in therapeutics, as a powerful tonic in cases of dysentery, &c. The mixture can easily be obtained from the leaves, bark, or wood, of cinchona, and even from bark which has been exhausted by ebullition with water or diluted acids, by cold maceration with weak milk of lime, by which it is dissolved, as it combines easily with bases. It is only the quinoevate of lime which has till now been used in medicine.—Dose. 2 to 8 grs. every two hours.

QUINQUINA. See CINCHONA.

QUIN'SY. See THROAT AFFECTIONS.

QUINTESENCE. Syn. QUINTA ESSENTIA, L. A term invented by the alchemists to represent a concentrated alcoholic solution of

the active principles of organic bodies. It is still occasionally employed in perfumery and the culinary art. See ESSENCE, TINCTURE, &c.

QUOTIDIAN. Occurring or returning daily. See AGUE.

RABBIT. The *Lepus cuniculus* (Linn.) of the Cuvian order *Rodentia*. The domestic rabbit, when young, is a light and wholesome article of food, approaching in delicacy to the common barn-door fowl; but has less flavour than the wild animal. The fat is among the 'simples' of the Ph. L. 1618. Its hair and skin are made into cheap furs, gloves, hats, &c.

RACAHOUT. *Syn.* RACAHOUT DES ARABES. This is said to be farina prepared from the acorns of *Quercus Ballota*, or Barbary oak, disguised with a little flavouring. The following is recommended as an imitation:—Roasted cacao or chocolate nuts, 4 oz.; tapioca and potato farina, of each, 6 oz.; white sugar, slightly flavoured with vanilla, $\frac{1}{2}$ lb. Very nutritious. *Used* as arrow-root.

RACEMIC ACID. *Syn.* PARATARTARIC ACID. This compound was discovered by Kestner, in 1820, replacing tartaric acid in grape-juice of the Department of the Vosges. Racemic acid and tartaric acid have exactly the same composition, and yield, when exposed to heat, the same products; the racemates also correspond in the closest manner with the tartrates. Racemic acid is rather less soluble than tartaric, and separates first from a solution containing the two acids. A solution of racemic acid precipitates a neutral salt of calcium, which is not the case with tartaric acid. A solution of racemic acid does not affect a ray of polarised light, while a solution of tartaric acid rotates the ray to the right.

RACK'ING. See CIDER and WINES.

RADICAL. *Syn.* RADICLE. According to the binary theory of the constitution of saline compounds, every salt is composed, like chloride of sodium (NaCl), of two sides or parts, which are termed its radicals. That part of a salt which consists of a metal, or of a body exercising the chemical functions of one, is called the metallic, basic, or basylous radical; while the other part, which, like chlorine, by combining with hydrogen would produce an acid, is designated the chlorous or acidulous radical. Every salt, therefore, consists of a basic and of an acid radical. Sometimes radicals are elementary in their nature, when they are called *simple*; and sometimes they are made up of a group of elements, when they are termed *compound*. Some radicals, both simple and compound, have been isolated, while many have but a hypothetical existence. In the following formulæ the vertical line separates the basic from the acid radicals, the former being on the left, the latter on the right:

H	F	Hydrofluoric acid (<i>Fluoride of hydrogen</i>).
Na	Cl	Chloride of sodium.
K	CN	Cyanide of potassium.
Ca	CO ₃	Carbonate of calcium.
NH ₄	Cl	Chloride of ammonium.
C ₂ H ₅	NO ₂	Nitrite of ethyl.

RADISH. The common garden radish (RAPHANUS, L.) is the root of *Raphanus sativus* (Linn.), one of the *Cruciferae*. There are several varieties. They are all slightly diuretic and laxative, and possess considerable power in exciting the appetite. The seed is pressed for oil. The horseradish (ARMORACIA, L.) belongs to a distinct genus.

RAIN-GAUGE. *Syn.* OMBOMETER, PLUVIOMETER, UDOMETER. An instrument for determining the quantity of water, which falls as rain, at any given place. A simple and convenient rain-gauge for agricultural purposes is formed of a wide-mouthed funnel, or open receiver, connected with a glass tube furnished with a stop-cock. The diameter of the tube may be exactly 1-100th that of the receiver, and if the tube be graduated into inches and tenths, the quantity of rain that falls may be easily read off to the 1-1000th of an inch. The instrument should be set in some perfectly open situation; and, for agricultural purposes, with its edge as nearly level with the ground as possible. The quantity of water should be duly measured and registered at 9 a.m., daily.

RAISINS. *Syn.* DRIED GRAPES; UVÆ (B. P.), UVÆ SICCATE, UVA (Ph. L.), UVÆ PASSÆ (Ph. E. & D.), L. "The prepared fruit of *Vitis vinifera*" (Linn.)—Ph. L. The grapes are allowed to ripen and dry on the vine. After being plucked and cleaned, they are dipped, for a few seconds, into a boiling lye of wood ashes and quacklime at 12° or 15° Baumé, to every 4 galls. of which a handful of culinary salt and a pint of salad oil has been added; they are then exposed for 12 or 14 days in the sun to dry; they are, lastly, carefully garbled, and packed for exportation. The sweet, fleshy kinds of grapes are those selected for the above treatment; and, in general, their stalks are cut about one half through, or a ring of bark is removed, to hasten their maturation.

Raisins are nutritious, cooling, antiseptic, and, in general, laxative; the latter to a greater extent than the fresh fruit. There are many varieties found in commerce. Their uses as a dessert and culinary fruit, and in the manufacture of wine, &c., are well known, and are referred to elsewhere. See GRAPES, WINES, &c.

RANCIDITY. The strong, sour flavour and odour which oleaginous bodies acquire by age and exposure to the air. For its prevention, see FATS, OILS (Fixed), &c.

RAPE OIL. See OILS (Fixed).

RASH. Erasmus Wilson notices four different affections, as included under this head:—

1. ST. ANTHONY'S FIRE, or ERYSIPELAS, the severest of them all, already referred to.

2. NETTLE-RASH, or URTICARIA, characterised by its tingling and pricking pain, and its little white elevations on a reddish ground, like the wheals caused by the sting of a nettle. This efflorescence seldom stays many hours, and, sometimes, not even many minutes, in the same place, and is multiplied or reproduced whenever any part of the skin is scratched or even touched. No part of the body is exempt from it, and when many of them occur together, and continue for an hour or two, the parts are often considerably swelled, and the features temporarily disfigured. In many cases these eruptions continue to infest the skin, sometimes in one place, and sometimes in another, for one or two hours together, two or three times a day, or, perhaps, for the greatest part of the twenty-four hours. In some constitutions this lasts only a few days; in others several months.

There are several varieties of nettle-rash or urticaria noticed by medical writers, among which URTICARIA FEBRILIS, PERSISTANS, and EVANIDA, are the principal.

The common cause of nettle-rash is some derangement of the digestive functions, arising either from the use of improper food or a disordered state of the nervous or other systems of the body. Lobsters, crabs, mussels, shrimps, dried fish, pork, cucumbers, mushrooms, and adulterated beer or porter, bear the character of frequently causing this affection. In childhood it commonly arises from teething. Occasionally, in persons of peculiar idiosyncrasy, the most simple article of food, as almonds, nuts, and even milk, rice, and eggs, will produce this affection.

The treatment may consist of the administration of gentle saline aperients, and in severer cases a gentle emetic, followed by the copious use of acidulated diluent drinks, as weak lemon-juice-and-water, effervescing potassa-draughts, &c., and, when required, diaphoretics. The clothing should be light, but warm, and the itching, when severe, may be allayed by the application of a lotion of water to which a little vinegar or camphorated spirit has been added; the latter must, however, be employed with caution. A hot knee-bath is useful in drawing the affection from the face and upper part of the body. A 'compress,' wrung out of cold water until it ceases to drip, and kept in contact with the stomach by means of a dry bandage, has been recommended to relieve excessive irritation of the stomach and bowels. It has been stated that decoction of Virginian snake-root is particularly useful in relieving chronic urticaria.

3. RED-RASH, RED-BLOTCH, or FIERY SPOT, is commonly the consequence of disordered general health, of dyspepsia, and particularly, in females, of tight lacing. Sometimes it is slight and evanescent; at others, it approaches in severity to the milder forms of erysipelas,

there being much swelling and inflammation. Chaps, galls, excoriations, and chilblains, are varieties of this disease produced by cold, excessive moisture, or friction. The treatment is similar to that of nettle-rash.

4. ROSE-RASH, FALSE MEASLES, or ROSEOLA, is an efflorescence, or rather a discoloration, of a rose-red tint, in small irregular patches, without wheals or papulæ, which spread over the surface of the body, and are ushered in by slight febrile symptoms. There are several varieties. The causes are the same as those which produce the preceding affections, and the treatment may be similar. In all of them strict attention to the diet, and a careful avoidance of cold applications, or exposure to cold, so as to cause a retrocession, are matters of the first moment.

RASPBERRY. *Syn.* HINDBERRY. The fruit of *Rubus Idæus*. (Linn.), a small shrub of the natural order *Rosaceæ*. It is cooling, antiscorbutic, and mildly aperitive. It is frequently used to communicate a fine flavour to liqueurs, confectionery, wine, &c. See FRUITS and VEGETABLES.

RATAFIA. Originally, a liquor drank at the ratification of an agreement or treaty. It is now the common generic name in France of liqueurs compounded of spirit, sugar, and the odoriferous and flavouring principles of vegetables, more particularly of those containing the juices of recent fruits, or the kernels of apricots, cherries, or peaches. In its unqualified sense, this name is commonly understood as referring to cherry-brandy or peach-brandy.

Ratafias are prepared by distillation, maceration, or extemporaneous admixture, in the manner explained under the head LIQUEURS. The following list includes those which are commonly prepared by the French liquorists:—

Ratafia d'Angelique. From angelica seeds, 1 dr.; angelica stalks, 4 oz.; blanched bitter almonds, bruised, 1 oz.; proof spirit or brandy, 6 quarts; digest for 10 days, filter; add, of water, 1 quart; white sugar, 3½ lbs.; mix well, and in a fortnight decant the clear portion through a piece of clear flannel.

Ratafia d'Anis. See ANISEED CORDIAL.

Ratafia de Baume de Tolu. From balsam of Tolu, 1 oz.; rectified spirit, 1 quart; dissolve, add water, 3 pints; filter, and further add of white sugar, 1½ lb. Pectoral and traumatic.

Ratafia de Brou de Noix. From young walnuts with soft shells (pricked or pierced), 60 in no.; brandy, 2 quarts; macé, cinnamon, and cloves, of each, 15 grs.; digest for 8 weeks; press, filter, add of white sugar, 1 lb.; and keeping it for some months before decanting it for use. Stomachic.

Ratafia de Cacao. *Syn.* R. DE CHOCOLAT. From Caraca cacao-nuts, 1 lb.; West Indian do., ½ lb.; (both roasted and bruised;) proof spirit, 1 gill; digest for 14 days, filter, and

add, of white sugar, 2½ lbs.; tincture of vanilla, ½ dr.; (or, a shred of vanilla may be infused with the nuts in the spirit instead;) lastly, decant in a month, and bottle it.

Ratafia de Café. From coffee, ground and roasted, 1 lb.; brandy or proof spirit, 1 gall.; sugar, 2 lbs.; (dissolved in) water, 1 quart; as last.

Ratafia de Cassis. From black-currant juice, 1 quart; cinnamon, 1 dr.; cloves and peach kernels, of each, ½ dr.; brandy, 1 gall.; white sugar, 3 lbs.; digest for a fortnight, and strain through flannel.

Ratafia de Cerise. From Morello cherries, with their kernels bruised, 8 lbs.; brandy or proof spirit, 1 gall.; white sugar, 2 lbs.; as last.

Ratafia de Chocolat. Ratafia de cacao (see above).

Ratafia de Coings. From quince juice, 3 quarts; bitter almonds, 3 drs.; cinnamon and coriander seeds, of each, 2 drs.; mace, ½ dr.; cloves, 15 grs.; (all bruised;) rectified spirit (quite flavourless), ½ gall.; digest for a week, filter, and add of white sugar, 3½ lbs.

Ratafia de Crème. From crème de noyau and sherry, of each, ½ pint; capillaire, ½ pint; fresh cream, 1 pint; beaten together.

Ratafia de Curaçoa. Curaçoa.

Ratafia de Framboises. Raspberry cordial.

Ratafia de Genièvre. From juniper berries (each pricked with a fork, ¼ lb.; caraway and coriander seed, of each, 20 gr.; finest malt spirit (22 u. p.), 1 gall.; white sugar, 2 lbs.; digest a week, and strain with expression.

Ratafia de Grenoble. From the small wild black cherry (with the kernels bruised), 2 lbs.; proof spirit, 1 gall.; white sugar, 3 lbs.; citron peel, a few grains; as before.

Ratafia de Grenoble, de Teyssère. From cherries (bruised with the stones), 1 quart; rectified spirit, 2 quarts; mix, digest for 48 hours, then express the liquor, and heat it to boiling in a close vessel; when cold, add of sugar or capillaire, q. s., together with some noyau, to flavour, and a little syrup of the bay laurel, and of galangal; in 3 months decant, and bottle it.

Ratafia de Noyeau. From peach or apricot kernels (bruised), 120 in no.; proof spirit or brandy, 2 quarts; white sugar, 1 lb.; digest for a week, press, and filter.

Ratafia de Gillets. From clove-pinks (without the white buds), 4 lbs.; cinnamon and cloves, of each, 15 grs.; proof spirit, 1 gall.; macerate for 10 days, express the tincture, filter, and add of white sugar, 2½ lbs.

Ratafia d'Ecorce d'Orange. Crème d'Orange.

Ratafia de Fleurs d'Oranger. From fresh orange petals, 2 lbs.; proof spirit, 1 gall.; white sugar, 2½ lbs.; as last. Instead of orange flowers, neroli, 1 dr., may be used.

Ratafia à la Provençale. From striped pinks, 1 lb.; brandy or proof spirit, 1 quart; white sugar, ½ lb.; juice of strawberries, ½ pint; saffron, 20 grs.; as before.

Ratafia des Quatre Fruits. From cherries, 30 lbs.; gooseberries, 15 lbs.; raspberries, 8 lbs.; black currants, 7 lbs.; express the juice, and to each pint add, of white sugar, 6 ozs.; cinnamon, 6 grs.; cloves and mace, of each, 3 grs.

Ratafia Rouge. From the juice of black cherries, 3 quarts; juices of strawberries and raspberries, of each, 1 quart; cinnamon, 1 dr.; mace and cloves, of each, 15 grs.; proof spirit or brandy, 2 galls.; white sugar, 7 lbs.; mace-rate, &c., as before.

Ratafia Sec. Take of the juice of gooseberries, 5 pints; juices of cherries, strawberries, and raspberries, of each, 1 pint; proof spirit, 6 quarts; sugar, 7 lbs.; as before.

Ratafia à la Violette. From orris powder, 3 oz.; litmus, 4 oz.; rectified spirit, 2 galls.; digest for 10 days, strain, and add of white sugar, 12 lbs., dissolved in soft water, 1 gall.

RATS. The common or brown rat is the *Mus Decumanus* (Linn.), one of the most prolific and destructive species of the *Rodentia*. It was introduced to these islands from Asia; and has since spread over the whole country, and multiplied at the expense of the black rat (*Mus Rattus*—Linn.), which is the old British species of this animal, until its inroads on our granaries, our stores, and dwelling-houses, have increased to such an extent, that its extirpation has become a matter of serious, if not of national, importance.

For the destruction of these noxious animals two methods are adopted:—

1. **Trapping.** To render the bait more attractive, it is commonly sprinkled with a little of one of the rat-scents noticed below. The trap is also occasionally so treated.

2. **Poisoning.** The following are reputed the most effective mixtures for this purpose:—

ARSENICAL PASTE. From oatmeal or wheaten flour, 3 lbs.; powdered indigo, ½ oz.; finely powdered white arsenic, ¼ lb.; oil of aniseed, ½ dr.; mix, add of melted suet, 2½ lbs.; and beat the whole into a paste. A similar compound has the sanction of the French Government.

ARSENICAL POWDER. From oatmeal, 1 lb.; moist sugar, ¼ lb.; white arsenic and rotten cheese, of each, 1 oz.; rat-scent, a few drops.

MILLERS' RAT POWDER. From fresh oatmeal, 1 lb.; nux vomica (in very fine powder), 1 oz.; rat-scent, 5 or 6 drops. This is highly spoken of by those who have used it.

MINERAL RAT-POISON. From carbonate of baryta, ¼ lb.; sugar and oatmeal, of each, 6 oz.; oils of aniseed and caraway, of each, a few drops.

PHILANTROPE MUOPHOBON. A French preparation, which, according to Mr. Beasley, consists of tartar emetic, 1 part, with farinaceous matter, 4 parts, and some other (unimportant) ingredients.

PHOSPHOR PASTE.

Among 'rat-scents' the following are said to be the most attractive:—

a. Powdered cantharides steeped in French brandy. For traps. It is said that rats are so fond of this, that if a little be rubbed about the hands they may be handled with impunity.

b. From powdered assafoetida, 8 grs.; oil of rhodium, 2 drs.; oil of aniseed, 1 dr.; oil of lavender, $\frac{1}{2}$ dr.; mix by agitation.

c. From oil of aniseed, $\frac{1}{2}$ oz.; tincture of assafoetida, $\frac{1}{4}$ oz.

d. From oil of aniseed, $\frac{1}{4}$ oz.; nitrous acid, 2 to 3 drops; musk (trituated with a little powdered sugar), 1 gr.

RAZORS. See PAPER, PASTE, and SHAVING.

REA'GENTS. See TESTS.

REAL'GAR. This valuable red pigment is the bisulphide of arsenic. It is found native in some volcanic districts; but that of commerce is prepared by distilling (in an earthen retort) arsenical pyrites, or a mixture of sulphur and arsenic, of orpiment and sulphur, or of arenous acid, sulphur, and charcoal, in the proper proportions. See BISULPHIDE OF ARSENIC.

RECTIFICATION. A second distillation of a fluid, for the purpose of rendering it purer.

RED. A term denoting a bright colour, resembling blood. Red is a simple or primary colour, but of several different shades or hues, as scarlet, crimson, vermilion, orange-red, &c.

Red Aniline. *Syn.* **ROSANILINE.** This artificial base is prepared by the action of bichloride of tin, mercurial salts, arsenic acid, and many other oxidising agents, upon aniline. The aniline repts of commerce, now so largely used for dyeing, are saline compounds, more or less pure, of rosaniline, with 1 equiv. of acid. These compounds are known under the names of 'magenta,' 'fuchsine,' 'rosine,' 'azaleine,' &c. In England the aniline red commonly employed is the acetate of rosaniline, which has been prepared by Mr. Nicholson in splendid crystals of very considerable dimensions. In France the hydrochlorate of rosaniline is chiefly employed. The free base presents itself in colourless crystalline plates, but its compounds with 1 equiv. of acid have, when dry, a beautiful green colour, with golden lustre, and furnish with water an intensely coloured red solution. See PURPLE (Aniline) and RED DYE, also TAR COLOURS.

RED DYE. The substances principally employed for dyeing reds are cochineal, lac-dye, and madder, which, under proper treatment, yield permanent colours of considerable brilliancy, the first and third more particularly so. Extremely beautiful but fugitive colours are also obtained from Brazil wood, safflower, archil, and some other substances. For purple-reds or crimsons (magenta, fuchsine, &c.), on silk or wool, the aniline reds (salts of ros-

aniline) are now extensively used. (See TAR COLOURS.) The mode of applying them is noticed under PURPLE DYE. SILK is usually dyed of a permanent red or scarlet with cochineal, safflower, or lac-dye; wool, with cochineal and, still more frequently, with madder; and cotton, with madder (chiefly), Brazil wood, &c. The leading properties of these substances are given under their respective names, and the methods of employing them are generally referred to in the articles DYEING, MORDANTS, &c., and, therefore, need not be repeated here. The following may, however, be useful to the reader:—

1. First give the 'goods' a mordant of alum, or of alum-and-tartar, rinse, dry, and boil them in a bath of madder. If acetate of iron be used instead of alum, the colour will be purple, and by combining the two, as mordants, any intermediate shade may be produced.

2. The yarn or cloth is put into a very weak alkaline bath at the boiling temperature, then washed, dried, and 'galled' (or, when the calico is to be printed, for this bath may be substituted one of cow-dung, subsequent exposure to the air for a day or two, and immersion in very dilute sulphuric acid. In this way the stuff gets opened, and takes and retains the colour better). After the 'galling,' the goods are dried, and alumed twice; then dried, rinsed, and passed through a madder bath, composed of $\frac{3}{4}$ lb. of good madder for every lb. weight of the goods; this bath is slowly raised to the boiling-point in the course of 50 or 60 minutes, more or less, according to the shade of colour required; after a few minutes, the stuff is taken out, and slightly washed; the operation is then repeated, in the same manner, with fresh madder; it is, lastly, washed and dried, or passed through a hot soap bath, which carries off the fawn-coloured particles.

3. (**ADRIANOPIE RED, TURKEY R.**) This commences with cleansing or scouring the goods by alkaline baths, after which they are steeped in oily liquors brought to a creamy state by a little carbonate of soda; a bath of sheep's dung is next often used as an intermediate or secondary steep; the oleaginous bath, and the operation of removing the superfluous or loosely adhering oil with an alkaline bath, is repeated two or three times, due care being taken to dry the goods thoroughly after each distinct process; then follow the distinct operations of galling, aluming, maddering, and brightening, the last for removing the dun-coloured principle, by boiling at an elevated temperature with alkaline liquids and soap; the whole is generally concluded with treatment by spirit of tin. In this way are given the most brilliant reds on cotton.

Obs. Wool takes from half its weight of madder to an equal weight to dye it red; cotton and linen take rather less. On account

of the comparative insolubility of the colouring matter of madder, this dye-stuff must be boiled along with the goods to be dyed, and not removed from the decoction, as is the practice in using many other articles. Other dye-stuffs are frequently added to the madder bath, to vary the shades of colour. Decoction of fustic, weld, logwood, quercitron, &c., are often thus employed, the mordants being modified accordingly. By adding bran to the madder bath, the colour is said to be rendered much lighter, and of a more agreeable tint.

RED GUM. A slight eruptive disease of infancy, occasioned by teething, and, less frequently, by irritation from rough flannel worn next the skin. See *STROPHULUS*.

RED LAVENDER. See *TINCTURE OF LAVENDER* (Compound).

RED LIQUOR. The crude solution of acetate or sulpho-acetate of alumina employed in calico-printing. It is generally prepared by mixing crude sulphate of alumina with about an equal weight of crude pyrolignite of lime, both being in the state of solution.

RED PIGMENTS. The preparation of the principal red pigments are described under their respective names. The following list includes most of the reds in use:—

Armenian Bole. *Syn.* *BOLE ARMENIAN*; *BOLUS ARMENIÆ*, L. Formerly imported from Armenia, Portugal, Tuscany, &c.; now generally made by grinding together a mixture of whiting, red oxide of iron, and red ochre, in nearly equal proportions.

Red, Brown. A factitious mixture of red oxide of iron and red ochre, in variable proportions.

Carmine.

Carminated Lake.

Red, Chrome. *Syn.* *DICHROMATE OF LEAD*, *RED CHROMATE OF L.*; *PLUMBI DICHROMAS*, *P. CHROMAS RUBRUM*, L. *Prep.* 1. Boil pure carbonate of lead with chromate of potassa, in excess, until it assumes a proper colour; then wash it well with pure water, and dry it in the shade.

2. Boil neutral chromate of lead with a little water of ammonia or lime water.

3. (Liebig and Wöhler.) Fuse saltpetre at a low red heat in a Hessian crucible, and throw in chromate of lead (pure chrome yellow), by small portions at a time, as long as a strong ebullition follows upon each addition of the pigment, observing to stir the mixture frequently with a glass rod; after repose for a minute or two, pour off the fluid part, and, as soon as the solid residuum is cold, wash it with water, and dry it by a gentle heat.

Obs. Great care must be taken, in conducting the last process, not to employ too much heat, nor to allow the saline matter to stand long over the newly formed chrome-red, as the colour is thus apt to change to a brown or orange. When well managed, the product has a crystalline texture, and so beautiful a

red colour that it vies with native cinnabar. The liquid poured from the crucible is reserved for manufacturing chrome yellow.

Red, Indian. *Syn.* *PURPLE OCHRE*; *OCHEA PURPUREA PERSICA*, *TERRA PERSICA*, L. This is a native production, brought from Ormus. A factitious article is prepared by calcining a mixture of colcothar and red ochre.

Lakes (Various).

Red, Light. From yellow ochre, by careful calcination. It works well with both oil and water, and produces an admirable flesh-colour by admixture with pure white. All the ochres, both red and yellow, are darkened by heat.

Red, Orange. *Syn.* *SANDIX*. Obtained from white lead, by calcination. Very bright.

Realgar. Bisulphide of arsenic.

Red Bole. See *ARMENIAN* and *VENETIAN BOLE*.

Red Chalk. A clay iron ore, much used for pencils and crayons, and, when ground, also for paints.

Red Lead. *Syn.* *MINIUM*. *The finest red lead is prepared by exposing ground and elutriated massicot, or dross of lead, in shallow iron trays (about 12 inches square, and about 4 or 5 inches deep), piled up on the hearth of a reverberatory furnace, to a heat of about 600 to 650° Fahr., with occasional stirring, until it acquires the proper colour. The furnace employed for the preparation of massicot during the day usually possesses sufficient residuary heat during the night for this process, by which fuel is saved. Lead for the above purpose should be quite free from copper and iron.

Red Ochre. A natural product abounding on the Mendip hills.

Red Orpiment. *Syn.* *RED ARSENIC*. *Ter-sulphide of arsenic.

Rose Pink. This is whitening coloured with a decoction of Brazil wood to which a little pearlash has been added. A very pretty colour, but it does not stand. It is always kept in a damp state. The colour may be varied by substituting alum for pearlash, or by the addition of a little spirits of wine.

Red, Venetian. *Syn.* *BOLUS VENETA*, L. A species of ochre, brought from Italy.

Vermilion. (See that word.)

REDUCTION. *Syn.* *REVIVIFICATION*. A term, in its fullest sense, applied to any operation by which a substance is restored to its neutral state; but now generally restricted, in chemistry, to the abstraction of oxygen, and hence frequently termed deoxidation or deoxidizement. This change is operated by either heating the substance in contact with carbon or hydrogen, or in exposing it to the action of some other body having a powerful affinity for oxygen. See *POTASSIUM*, &c.

REFINING. A term employed in commercial chemistry and metallurgy synonymously with purification. The separation of

the precious metals from those of less value, as in the operation of parting, constitutes the business of the 'refiner.' See GOLD, SILVER, &c.

REFRACTION (of Light). The deviation of a ray of light from its original path on entering a medium of a different density or power. For the practical application of this property, see GEMS.

REFRIGERANTS. Medicines or agents which tend to lessen the animal temperature without causing any marked diminution of sensibility or nervous energy. Among internal refrigerants cold water, weak acidulous drinks, and saline aperients, are those which are, probably, the best known, and the most useful. Among external refrigerants are cold, cold water, evaporating lotions, weak solutions of subacetate of lead, &c.

REFRIGERATION. The abatement of heat; the act or operation of cooling.

Among the purposes to which refrigeratory processes are applied in the arts, the principal are—the condensation of vapours—the cooling of liquids—the congelation of water, and—the production of extreme degrees of cold in chemical operations. The first of these is referred to under the heads DISTILLATION, STILL, &c.; and the second, under WORT. It is, therefore, only necessary to notice here the third and fourth applications of cold, artificially produced, above referred to.

The refrigeratory processes at present employed depend upon the greater capacity for heat which the same body possesses as its density lessens, or its attenuation increases; as exhibited in the sudden liquefaction of solids, the rapid evaporation of liquids, and the almost instantaneous return of atmospheric air, or other gaseous body, from a highly condensed state to its normal condition. The loss of sensible heat in the first example is the basis of the various processes of producing cold by what are commonly called 'FREEZING' or 'FRIGORIFIC-MIXTURES,' all of which act upon the principle of liquefying solid substances without supplying heat. The caloric of liquidity being in these cases derived from that previously existing in the solid itself in a sensible state, the temperature must necessarily fall. The degree of cold produced depends upon the quantity of heat which is thus diffused through a larger mass, or which, as it were, disappears; and this is dependent on the quantity of solid matter liquefied, and the rapidity of the liquefaction. Saline compounds are the substances most frequently employed for this purpose, and those which have the greatest affinity for water, and thus liquefy the most rapidly, produce the greatest degree of cold. Similar changes occur during the evaporation of liquids. When heat passes from the sensible to the insensible state, as in the formation of vapour, cold is generated. This may be shown by pouring a few drops of ether or rectified spirit on the palm of the

hand, when a strong sensation of cold is experienced. A still more familiar illustration of this fact is exhibited in the rapidity with which the animal body loses heat when enveloped in damp or wet clothing. The evaporation of water produces a degree of cold which is greater than that of other liquids, in exact proportion as the insensible or latent heat of its vapour exceeds theirs. In the attenuation or rarefaction of gases similar phenomena occur.

It has been found that evaporation proceeds much more rapidly from the surface of fluids in a vacuum than in the atmosphere. Water may be easily frozen by introducing a surface of sulphuric acid under the receiver of an air-pump, over which is placed a capsule filled with water, so that the vapour arising from the latter may be immediately absorbed by the former. After a few strokes of the piston the water is converted into a solid cake of ice. The acid operates by absorbing the aqueous vapours as soon as generated, and thus maintaining the integrity of the vacuum. Professor Leslie found that, when air is thus rarified 250 times, the surface of evaporation was cooled down 120° in winter; and when only 50 times, a depression of 80° or even 100° took place. "Sulphuric acid is capable of congelating more than 20 times its weight of water before it has imbibed nearly its own bulk of that liquid, or has lost about $\frac{1}{4}$ th of its refrigerating power." (Ure.) Sulphuric acid, which has become diluted in this way, may be reconcentrated by heat. Any substance having a great tendency to absorb moisture may be substituted for the sulphuric acid. Fused chloride of calcium, quicklime, nitrate of magnesium, chloride of zinc, and oatmeal (dried nearly to brownness before a common fire), have been used for this purpose. Again, instead of employing an air-pump, a vacuum may be produced by the agency of steam, afterwards condensed by the affusion of cold water.

A pleasing philosophical toy, illustrative of the evaporative power of a vacuum, is the 'CRYOPHORUS,' or 'FROST-BEARER,' of Dr. Wollaston. This instrument consists of two

small glass globes, united by a tube, one of which is partly filled with water. The whole apparatus is perfectly free from air, and is, consequently, filled with attenuated aqueous vapours. No sooner is the pressure removed as by plunging the empty ball into a freezing mixture (which condenses the vapour), than rapid evaporation commences, and the water in the other ball is frozen in two or three minutes.

Even in hot climates ice may be produced under favorable circumstances by evapora-

tion. On the open plains, near Calcutta, this is effected by exposing a thin stratum of water to the atmosphere, during the fine clear nights of December, January, and February. The pans are made of porous earthenware, and water is poured in to the depth of about $1\frac{1}{2}$ inch. A large number of these vessels are arranged in an excavation in the ground, 30 or 40 feet square and 2 feet deep, the bottom of which is covered, to the depth of 10 or 12 inches, with sugar canes or the stalks of Indian corn. At sunrise the pans are visited, the ice separated from the water, and packed as tight as possible in a deep cavity or pit, well screened from the heat.

Several machines have recently been invented by which water is frozen in large quantities, by exposure to condensed air in the act of its subsequent expansion. They are worked by either hand or steam power. The refrigerating apparatus invented by Mr. Kirk, of the Bathgate Paraffin Works, acts on this principle; and it does its work so efficiently that it produces a cooling effect equivalent to two tons of ice every twenty-four hours, at a very small expenditure of fuel. A small model worked by hand will readily freeze mercury. Kirk's apparatus is used at Bathgate

to cause the crystallisation of solid paraffin from the heavy paraffin oils. Formerly, a machine, acting by the evaporation of ether, was employed for the same purpose.

For the production of an extremely low temperature, such as is required for the liquefaction of some gases, Faraday employed solid carbonic acid mixed with a little ether.

In the production of ice, or an extreme degree of cold, by saline mixtures, the salts should be in the crystallised state, and as rich as possible in water, but without being in the least damp. They should also be coarsely pulverised at the time of using them, and should not be mixed until immediately before throwing them into the liquid ingredients. The mixture should be made in a thick vessel, well clothed, to prevent the accession of external heat; and the substance to be acted on should be contained in a very thin vessel, so as to expose it more fully to the action of the mixture. On the large scale, a vessel called a 'FREEZING POT' or 'SABOTIÈRE' is commonly employed. The following table, though founded on experiments made more than 50 years ago by Mr. Walker, gives full and accurate information on the subject of freezing mixtures:—

TABLE exhibiting a few of the most useful FRIGORIFIC MIXTURES. *Drawn up from actual experiments performed by Mr. WALKER.*

Ingredients.	Thermometer sinks.	Deg. of cold produced.
{ Snow or pounded ice 2 parts }	{ From any temperature.	to -5° —
{ Chloride of sodium 1 " }		to -12° —
{ Snow or pounded ice 5 " }		to -25° —
{ Chloride of sodium 2 " }		From $+32^{\circ}$ to -27° 59°
{ Sal ammoniac 1 " }		From $+32^{\circ}$ to -50° 82°
{ Snow or pounded ice 12 " }	{ From $+50^{\circ}$ to $+10^{\circ}$	From $+50^{\circ}$ to $+10^{\circ}$ 40°
{ Chloride of sodium 5 " }		From $+50^{\circ}$ to $+4^{\circ}$ 46°
{ Nitrate of ammonia 5 " }		From $+50^{\circ}$ to $+7^{\circ}$ 57°
{ Snow 8 " }		From $+50^{\circ}$ to -21° 71°
{ Hydrochloric acid (concentrated) 5 " }		From $+50^{\circ}$ to 0° 50°
{ Snow 2 " }	{ From 0° to -46°	From 0° to -46° 46°
{ Crystallized chloride of calcium 3 " }		From -20° to -60° 40°
{ Sal ammoniac 5 " }		From 0° to -66° 66°
{ Nitrate of potassa 5 " }		From -40° to -73° 33°
{ Water 16 " }		From -68° to -91° 23°
{ Nitrate of ammonia 1 " }	{ From -68° to -91°	
{ Water 1 " }		
{ Nitrate of ammonia 1 " }		
{ Carbonate of soda 1 " }		
{ Water 1 " }		
{ Phosphate of soda 9 " }		
{ Nitrate of ammonia 6 " }		
{ Diluted nitrous acid ¹ 4 " }		
{ Sulphate of soda 8 " }		
{ Hydrochloric acid 5 " }		
{ Snow 3 " }		
{ Diluted nitrous acid ¹ 2 " }		
{ Snow 2 " }		
{ Sulphuric acid 1 " }		
{ Water 1 " }		
{ Snow 1 " }		
{ Crystallized chloride of calcium 2 " }		
{ Snow 1 " }		
{ Crystallized chloride of calcium 3 " }		
{ Snow 8 " }		
{ Sulphuric acid 5 " }		
{ Water 5 " }		

¹ Fuming 'nitrous acid,' 2 parts; water, 1 part; by weight.

Obs. The materials in the first column are to be cooled, previously to mixing, to the temperature required in the second, by the use of other mixtures.

REG'ULUS. A term applied by the alchemists to various metallic matters obtained by fusion; as **REGULUS OF ANTIMONY**, **ARSENIC**, &c. It is now obsolete.

REL'ISHES. See **SAUCE**.

REMIT'TENT. A term applied to fevers, and other diseases, which exhibit a decided remission in violence during the twenty-four hours, but without entirely leaving the patient, in which they differ from **intermittents** or **agues**.

REN'NET. *Syn.* **RUNNET**, **PREPARED CALF'S MAW**. The fourth or true digesting stomach of the calf, freed from the outer skin, fat, and useless membrane, washed, treated with either brine or dry salt for a few hours, and then hung up to dry. When well prepared, the dried '*vells*' somewhat resemble parchment in appearance.

Uses, &c. Rennet is employed to curdle milk. A piece of the requisite size is cut off, and soaked for some hours in whey or water, after which the whole is added to the milk for curdling, slightly warmed, and the mixture is slowly heated, if necessary, to about 122° Fahr. In a short time after this temperature has been attained, the milk separates into a solid white coagulum (curd), and into a yellowish, translucent liquid (whey). Two square inches from the bottom of a good '*vell*' are sufficient for a cheese of 60 lbs. It is the gastric juice of the stomach that operates these changes. The stomachs of all sucking quadrupeds possess the same properties. See **CHEESE**.

Rennet, Liquid. *Syn.* **ESSENCE OF RENNET**. *Prep.* From fresh rennet (cut small), 12 oz.; common salt, 3 oz.; knead them together, and leave the mixture at rest, in a cool place, for 5 or 6 weeks; then add, of water, 18 oz.; good rum or proof spirit, 2 oz.; lastly, digest for 24 hours, filter, and colour the liquid with a little burnt sugar.

Obs. 2 or 3 teaspoonfuls will curdle a quart of milk. Some persons use white wine instead of water, with simple digestion for a day or two.

RES'IN. *Syn.* **RESINA**, **L.** This name is applied to many vegetable principles composed of the elements carbon, hydrogen, and oxygen. The resins (**RESINÆ**) cannot be very accurately defined, but we may in a general way describe them as substances which are solid at ordinary temperatures, more or less transparent, inflammable, readily fusible, do not volatilise unchanged, become negatively electrified by rubbing; are insoluble in water, but soluble in alcohol; mostly inodorous, and readily incorporated with fatty bodies by fusion. Their sp. gr. varies from .9 to 1.2. According to Liebig, they are oxidised essential oils. Common resin, rosin, or colophony, and the shellac of which sealing-wax is made, are familiar examples of these substances. (See *below*.)

Resin, Black. *Syn.* **ROSIN**, **BLACK R.**, **COLOPHONY**; **RESINA NIGRA**, **COLOPHONIA**, **L.** What remains of turpentine after the oil has been distilled. When this substance, whilst still fluid, is agitated with about 1-8th part of

water, it forms the yellow resin of pharmacy. Used for violin bows, dark-coloured ointments, varnishes, &c.

Resin, Yellow. *Syn.* **YELLOW ROSIN**, **WHITE R.**; **RESINA FLAVA**, **RESINA** (**Ph. L.**), **L.** Detergent. Used in ointments, plasters, &c. (See *above*.)

RES'INOIDS. *Syn.* **RESINOUS EXTRACTS CONCENTRATED E.**; **EXTRACTA RESINA**, **L.** Under this head, the so-called '*Eclectics*,' who form a numerous class among American physicians, place their most important '*concentrated remedies*.' "Viewed as pharmaceutical preparations eligible for use in medicine, though not purified so as to rank as distinctive proximate principles, these are very appropriately named '*resinous extracts*,' or '*resins*.' The term '*resinoid*,' so commonly used, is less appropriate to the class, implying, as it does, a resemblance to resins, while all of these are either resins, oleo-resins, or more or less mixed proximate principles possessing no real resemblance to the class of resins." (Parrish.) Most of them are prepared from plants indigenous to North America, by precipitating a strong alcoholic tincture with water. They are all brought to the condition of powder, those which are naturally soft and oily being mixed with a sufficient quantity of sugar of milk, or other dry material. One of these eclectic remedies has been introduced into regular practice. See **PODOPHYLLIN**.

RESOLV'ENTS. *Syn.* **DISCUTIENTS**; **RESOLVENTIA**, **L.** Substances or agents which discuss or resolve inflammatory and other tumours. See **DIGESTIVES**.

RESPIRA'TION. The peculiar function by which the blood is submitted to the action of the air, for the purpose of removing carbonic acid, and restoring its vitality by the absorption of atmospheric oxygen.

The air expired from the lungs is found to have undergone a most remarkable change. It is now loaded with aqueous vapour, whilst a considerable portion of its oxygen has disappeared, and its place is supplied by about a like volume of carbonic acid. It is no longer capable of supporting animal life, and even a lighted taper plunged into it is immediately extinguished. In the mean time, the '*venous blood*' which entered the lungs from the right chambers of the heart has lost its dingy hue, and has acquired the rich florid colour which is characteristic of '*arterial blood*.' In this state it is returned to the left chambers of the heart, and is propelled by that organ to every part of the body, from which it passes by the capillaries to the veins, and by these again to the heart and lungs, to undergo the same changes and circulation as before. The carbon and hydrogen of the blood, ultimately derived from the food, are, in this course, gradually converted into carbonic acid and water, by a species of slow combustion; but how these changes are effected is not definitely ascertained.

The lungs, as is well known, receive the

not only employed to mix with genuine saffron, but are extensively sold to the country dealers for that purpose. Old and dry saffron is 'freshened up' by rubbing it between the hand, slightly oiled, and then repicking it.

Prop., &c. Saffron is anodyne, cordial, emmenagogue, and exhilarant; but is now seldom employed, except as an adjuvant, in medicine. Amongst cooks, confectioners, and liquorists, it is largely used on account of its fine colour.

Meadow Saffron. See COLCHICUM.

SAGAPENUM. This substance is described in the London Pharmacopœia as a gum resin, the production of an uncertain species of *Ferula*. The mass of the sagapenum sold to the retail trader is, however, a factitious article, formed by softening a mixture of assa-fœtida, 3 parts, and galbanum, 15 parts, over a water or steam bath, and then stirring in about $\frac{1}{4}$ th of their weight of oil of turpentine, with a little oil of juniper. This mixture is labelled 'Gum Sagapeni Opt,' an inferior sort being made by adding sundry portions of yellow resin and paste of gum tragacanth to the above.

PREPARED SAGAPENUM (SAGAPENUM PRÆPARATUM—Ph. L.) is ordered to be prepared in the same manner as 'prepared ammoniacum.'

Obs. Sagapenum is the feeblest of all the fetid gum-resins.—*Dose.* 5 to 15 grs., made into pills; as an antispasmodic and emmenagogue.

SAGO. *Syn.* SAGO (Ph. L. E. & D.), L. "The fæcula (starch) from the stem of *Sagittaria*, *S. Rumphii*, and, perhaps, of other species of palms." (Ph. L.) It forms the principal portion of the pith of the Sago palms, the Gommuti palm, the Talipot palm, and other allied trees. Its properties and uses, for the most part, resemble those of arrow-root. It is used for making puddings, jellies, &c.

SALT. [L.] Salt. A word much used in compound names, handed down to us from the old chemists.

Sal Absinthii. Carbonate of potassium.

Sal Acetosellæ. Binixalate and quadroxalate of potassium.

Sal Alem'broth. Ammoniated mercury (white precipitate).

Sal Amm'niac. Chloride of ammonium.

Sal de Duobus. Sulphate of potassium.

Sal Diure'ticus. Acetate of potassium.

Sal Enix'tum. Crude bisulphate of potassium.

Sal Gem'mæ. Rock or fossil salt (chloride of sodium).

Sal Mar'tis. Sulphate of iron.

Sal Mirab'ile. Sulphate of sodium.

Sal Perla'tum. Phosphate of sodium.

Sal Polycres'tus. Sulphate of potassium.

Sal Prunell'a. *Syn.* SORE-THROAT SALT, CRYSTAL MINERAL; POTASSÆ NITRAS FUSA, NITRUM TABULATUM, SAL PRUNELLE, L. From nitre, fused in a Hessian crucible, and poured out on a smooth surface, or into moulds,

to cool. Its usual form and size is that of an ordinary musket-bullet, with the tail, in which state it is known in the drug trade as 'sal prunellæ globosum.' When in cakes, it is often called 'sal p. in placentis,' or 's. p. tabulatum.' A small portion allowed to dissolve slowly in the mouth, the saliva being slowly swallowed, often removes incipient inflammatory sore throat.

Sal Saturn'i. Sugar of lead (neutral acetate of lead).

Sal Seignette'. Rochelle salt (tartrate of potassium and sodium).

Sal Volatile. Sesquicarbonate of ammonia. The name is commonly used as an abbreviation of aromatic spirit of ammonia. See SPIRITS (Medicinal).

SALADS are generally made of esculent vegetables, either singly or mixed, chosen according to taste or time of year, and 'dressed' with oil, vinegar, and salt, and sometimes also with mustard and other condiments. Sliced boiled egg is a common addition. Cold meat, poultry, and game, sliced small, with some cucumber or celery, and a little onion or chopped parsley, or, instead of them, some pickles, make a very relishing salad. Fish are also employed in the same manner.

Salad, Let'tuce. *Prep.* Take two large lettuces, remove the faded leaves and the coarser green ones; next cut the green tops off, pull each leaf off separately, rinse it in cold water, cut it lengthways, and then into four or six pieces; put these into a bowl, and sprinkle over them, with your fingers, 1 small teaspoonful of salt, $\frac{1}{4}$ do. of pepper, 3 do. of salad oil, and 2 do. of English or 1 of French vinegar; then with the spoon and fork turn the salad lightly in the bowl until thoroughly mixed; the less it is handled the better. A teaspoonful each of chopped chervil and tarragon is an immense improvement.

Obs. The above seasoning is said to be enough for $\frac{1}{4}$ lb. of lettuce. According to Soyer, it is "such as the Italian count used to make some years since, by which he made a fortune in dressing salads for the tables of the aristocracy." The above may be varied by the addition of 2 eggs, beiled hard, and sliced, a little eschalot, or a few chives or young onions. Several other salad herbs, especially endive, water-cresses, and mustard-and-cress, may be 'dressed' in the same manner; always remembering that the excellence of a salad depends chiefly on the vegetables which compose them being recently gathered and carefully cleansed.

To improve the appearance of the above and other salads, when on the table or side-board, before being used, the gay flower of the nasturtium or marigold, with a little sliced beet-root or radish, and sliced cucumber, may be tastefully intermixed with them.

Salad, Lobs'ter. *Prep.* (Soyer.) 'Have the bowl half filled with any kind of salad herb you like, as endive, lettuce, &c.; then break

lobster in two, open the tail, extract the meat in one piece, break the claws, cut the meat of both in small slices, about a quarter of an inch thick, and arrange these tastefully on the salad; next take out all the soft part from the belly, mix it in a basin with 1 teaspoonful of salt, $\frac{1}{2}$ do. of pepper, 4 do. of vinegar, and 4 do. of oil; stir these well together, and pour the mixture on the salad; lastly, cover it with 2 hard eggs, cut into slices, and a few slices of cucumber." "To vary this, a few capers and some fillets of anchovy may be added, stirred lightly, and then served, either with or without some salad sauce. If for a dinner, ornament it with some flowers of the nasturtium and marigold."

SALEP. *Syn.* SALOP, SALOOP. The tuberous roots of *Orchis mascula*, and other allied species, washed, dried, and afterwards reduced to coarse powder. That imported from Persia and Asia Minor occurs in small oval grains, of a whitish-yellow colour, often semitranslucent, with a faint, peculiar smell, and a taste somewhat resembling gum tragacanth. It consists, chiefly, of bassorin and starch, is very nutritious, and is reputed aphrodisiac. It is employed in the same way as sago. A decoction of about 1 oz. of this substance in a pint of water was formerly sold at street-stalls. A tea made of sassafras chips, flavoured with milk and coarse brown sugar or treacle, was also sold in the same way, and under the same name.

FRENCH SALEP is prepared from the potato. Dr. Ure says that the *Orchis mascula* of our own country, properly treated, would afford an article of salep equal to the Turkey, and at a vastly lower price.

SALICIN. $C_{13}H_{15}O_7$. A white, crystalline substance, discovered by Le Roux and Buchner, in the bark and leaves of several species of *Salix* and *Populus*. It occurs most abundantly in the white willow (*Salix alba*) and the aspen (*Salix helix*), but is also found in all the bitter poplars and willows. From willow bark which is fresh, and rich in salicin, it may be obtained by the cautious evaporation of the cold aqueous infusion.

Prep. 1. (Merck.) Exhaust willow bark by repeated coction with water, concentrate the mixed liquors, and, while boiling, add litharge until the liquid is nearly decoloured; filter, remove the dissolved oxide of lead, first by sulphuric acid, and afterwards by sulphuret of barium; filter, and evaporate, that crystals may form; the crystals must be purified by re-solution and recrystallisation.

2. As No. 1, but using a stream of sulphuretted hydrogen, to free the solution from lead.

3. (P. Cod.) To a strong filtered decoction of willow bark add milk of lime, to throw down the colour; filter, evaporate the liquor to a syrupy consistence, add alcohol (sp. gr. 847), to separate the gummy matter, filter, distil off the spirit, evaporate the residuum, and set it

aside in a cool place to crystallise; the crystals are purified by solution in boiling water, agitation with a little animal charcoal, and recrystallisation.

Prop., &c. Salicin forms white, silky needles and plates; it is intensely bitter; inodorous; neutral; non-basic; fuses at 230° Fahr., with decomposition; burns with a bright flame; is soluble in $5\frac{1}{2}$ parts of water at 60° , and in much less at 212° ; dissolves readily in alcohol; but is insoluble in ether. It is tonic, like sulphate of quinine, but less liable to irritate the stomach. It is given in indigestion and intermittent diseases, in from 5 to 10 gr. doses.

Pur. & tests.—1. It is entirely soluble in water and rectified spirit.—2. When strongly heated, it is wholly dissipated, and, if kindled, burns with a bright flame, leaving a bulky charcoal.—3. Its solution is absolutely neutral to test-paper.—4. Concentrated sulphuric acid causes it to agglutinate into resin-like lumps, with the accession of an intense blood-red colour.—5. When its aqueous solution is mixed with some hydrochloric acid, or dilute sulphuric acid, and the mixture is boiled for a short time, the liquid suddenly becomes turbid, and deposits SALIRETIN, under the form of a granular crystalline precipitate. This is characteristic.—6. No reagent deposits salicin without decomposition. See SALICYLIC and SALICYLOUS ACIDS.

SALICYL. C_7H_5O . A compound radical, forming the basis of the so-called SALICYL-COMPOUNDS, or SALICYL-SERIES. It is known only in combination. The volatile oil of meadow-sweet is a natural hydride of salicyl, a substance which, when artificially prepared, is better known under the name of SALICYLOUS ACID. (See below.)

SALICYLIC ACID. $H_2C_7H_3O_4$. A peculiar volatile, crystallisable acid, discovered by Piria. It is obtained by fusing salicyloous acid with solid hydrate of potassa in slight excess, until the mixture turns white and gas is disengaged, and treating a solution of the residuum with hydrochloric acid, in slight excess, to separate the potassa; the salicylic acid separates in crystals, which are purified by solution in hot water. It may also be obtained from the oil of partridge-berry (*Gaultheria procumbens*), by acting on it with a strong and hot solution of potassa, and afterwards separating the acid as before. This oil is methylo-salicylic ether, or salicylate of oxide of methyl. In its general properties, salicylic acid closely resembles benzoic acid.

SALICYLOUS ACID. $C_7H_5O_2$. *Syn.* SALICYLOL, HYDROSALICYLIC ACID†, HYDRIDE OF SALICYL, ARTIFICIAL OIL OF MEADOW-SWEET. A nearly colourless, oily, inflammable liquid, discovered by Pagenstecher in the volatile oil of *Spiraea ulmaria* (meadow-sweet), which, when pure, entirely consists of it; and by Piria, as a product of the decomposition of salicin.

Prep. The oil of meadow-sweet is mixed with a strong solution of caustic potassa, and

the yellow crystalline mass which separates on agitation is purified by pressure between folds of bibulous paper and recrystallisation from alcohol; the resulting crystals (salicylite of potassium) are then decomposed by the addition of dilute sulphuric acid, the floating oil separated from the water, and freed from moisture by careful distillation from chloride of calcium.

Prop., &c. Salicylous acid is soluble in ether and alcohol, and slightly so in water, to which it imparts its peculiar fragrance and the characteristic property of striking a deep violet colour with the sesquisalts of iron. It is distinguished from salicylic acid, which also exhibits this reaction, by its liquid form and odour.

SALIVA. See MASTICATION.

SALMON. *Syn.* SALMO, L. The *Salmo Solar* (Linn.), a well-known, soft-finned abdominal fish. Its normal locality is at the mouth or estuary of the larger rivers of the northern seas, which, during the breeding season, it ascends, sooner or later, in the summer months, against all obstacles, for the purpose of depositing its spawn.

The salmon is an excellent and highly esteemed fish; but it is rich, oily, and difficult of digestion, and, therefore, ill adapted to the delicate or dyspeptic. When pickled, salted,

or smoked, it is only fitted for persons of very strong stomachs, although in this state it is regarded as a great delicacy by epicures.

Salmon is preferably cooked by boiling. One of weighing 10 lbs. will require to be gently simmered for about an hour, reckoning from the time the water commences boiling. For fish of other weights, from 6 to 7 minutes per lb. may be allowed. See FISH, &c.

SASSAFOOD. Sassafras (chips) tea, flavoured both milk and sugar. A wholesome and useful drink in cutaneous and rheumatic affections. See SASSAP.

SALT. *Syn.* SAL, L.; SEL, Fr. Salts may be regarded as acids in which one or more atoms of hydrogen, a constant constituent of all true acids, are replaced by a metal or other basic radical. This relationship between acids and salts will be better understood by reference to the subjoined list of acids and their corresponding potassium and ammonium salts:

ACIDS.	SALTS.
HCl (Hydrochloric acid)	— KCl (Chloride of potassium).
" " "	— NH ₄ Cl (Chloride of ammonium).
HNO ₃ (Nitric acid)	— KNO ₃ (Nitrate of potassium).
" " "	— NH ₄ NO ₃ (Nitrate of ammonium).
H ₂ SO ₄ (Sulphuric acid)	— K ₂ SO ₄ (Sulphate of potassium).
" " "	— (NH ₄) ₂ SO ₄ (Sulphate of ammonium).

Acids are, in fact, hydrogen salts. The so-called DOUBLE SALTS are, according to one view, combinations of two salts of the same acid, but of different basic radicals; thus, com-

mon alum is a compound of sulphate of aluminium and sulphate of potassium.

The salts are a most important class of bodies, and their applications and uses in the arts of life and civilisation are almost infinite. See NOMENCLATURE, &c.

Salt, Bitter Pur'ging. Epsom salt.

Salt, Cathartic. Of GLAUBER, sulphate of sodium; ENGLISH or BITTER S., sulphate of magnesium (Epsom salt).

Salt, Common. *Syn.* CULINARY SALT. Chloride of sodium.

Salt, Diuretic. Acetate of potassium.

Salt, Ep'som. Sulphate of magnesium.

Salt, Febr'ifuge. Chloride of potassium.

Salt, Fu'sible. Phosphate of ammonium.

Salt, Glauber's. Sulphate of sodium.

Salt, Macquer's. Binaseniate of potassium.

Salt, Microcos'mic. Phosphate of sodium and ammonium.

Salt, Red. Common salt wetted with an infusion of beet-root, or cochineal, or tincture of red sanders wood, then dried, and rubbed through a sieve. Used to impart a colour to gravies, &c. Infusion of saffron also gives a beautiful colour for this purpose. It has been proposed to colour Epsom salt in this way, to distinguish it from oxalic acid.

Salt, Rochelle. Tartrate of potassium and sodium.

Salt, Sea. Chloride of sodium.

Salt, Sed'ative. Boracic acid.

Salt, Smelling. See SALTS (*below*).

Salt, Sore-throat. Sal prunella.

Salt, Taste'less. Phosphate of sodium.

Salt, Veg'etable. Tartrate of potassium.

Salt, Volatile. Common carbonate of ammonium.

Salt of Lem'ons. *Syn.* SAL LIMONUM, L. Citric acid. That sold in the shops for the removal of ink spots from linen is binoxalate or quadroxalate of potassium, either alone or mixed with one half its weight of cream of tartar.

Salt of Sor'rel. Binoxalate or quadroxalate of potassium.

Salt of Steel. Sulphate of iron.

Salt of Tar'tar. Carbonate of potassium.

Salt of Vit'riol. Sulphate of zinc.

Salt of Wormwood. Carbonate of potassium.

SALTPETRE. Nitrate of potassium.

SALTING. PICKLING. *Syn.* This is an easy method of preserving butcher's meat, fish, and, indeed, most animal substances. It is performed in two ways:—

1. (DRY SALTING.) This, as practised in Hampshire, Yorkshire, and in various large establishments elsewhere, consists in merely well rubbing ordinary culinary salt, mixed with a little saltpetre, into the meat, until every crevice is thoroughly penetrated, and, afterwards, sprinkling some over it, and placing it on a board or in a trough, in such a manner that the brine may drain off. On the small scale, in private families, a mixture of salt, 2 lbs., with saltpetre, 1½ or 2 oz., either with

or without about an oz. of good moist sugar, is commonly used for the purpose, and imparts a fine flavour to the meat. In both cases the pieces are turned every day, or every other day, until sufficiently cured, a little fresh salt being added as required. Sometimes the fresh meat is packed at once in casks, with the best coarse-grained or bay salt. This method is that commonly adopted for sea stores.

2. (WET SALTING, or PICKLING IN BRINE.) When the meat is allowed to lie in the liquor that runs from it (see *above*), or is at once plunged into strong brine, it is said to be 'pickled,' or 'wet salted.' On the small scale, this is most conveniently performed by rubbing the fresh meat with salt, &c., as above, and, after it has lain a few hours, putting it into a pickle formed by dissolving about 4 lbs. of good salt and 2 oz. of saltpetre in 1 gall. of water, either with or without the addition of $\frac{1}{2}$ to 1 lb. of moist sugar. This pickling liquor gets weaker by use, and should, therefore, be occasionally boiled down a little, and skimmed, at the same time adding some more of the dry ingredients. Three to ten days, depending on the size, is sufficiently long to keep meat in the brine. When it is taken out it should be hung up to dry, after which it may be packed in barrels with coarse-grained salt, or smoked, whichever may be desired. Saltpetre added to brine gives the meat a red colour, and brown sugar improves the flavour.

The sooner animal substances, more especially flesh, are salted after being killed, the better, as they then possess considerable absorbent power, which they gradually lose by age. See PUTREFACTION, SCURVY, SMOKING, &c.

SALTS (Smelling). *Syn.* SAL VOLATILIS OLEOSUS, L. Sesquicarbonate of ammonia commonly passes under the name of 'SMELLING SALTS,' and, with the addition of a few drops of essential oil, is frequently employed to fill 'SMELLING BOTTLES'; but when a strong and durable pungency is desired, the carbonate should alone be used, as in one or other of the following formulæ:—

1. Carbonate (not sesquicarbonate) of ammonia, 1 lb.; oil of lavender (Mitcham), 2 oz.; essence of bergamot, 1 oz.; oil of cloves, $\frac{1}{2}$ oz.; rub them together, and sublime; keep the product in well-stopped bottles.

2. Carbonate of ammonia, 1 lb.; oil of lavender, 2 oz.; oils of bergamot and lemon, of each, 1 oz.; as the last.

3. Carbonate of ammonia, $\frac{1}{2}$ lb.; essence of bergamot, 1 oz.; oil of verbena, $\frac{1}{2}$ oz.; otto of roses, 1 dr.; as before.

4. Carbonate of ammonia, $\frac{3}{4}$ lb.; essences of bergamot and lemon, of each, $\frac{1}{2}$ oz.; essence de petit grain, $\frac{1}{2}$ oz.; oil of cloves, 1 dr., as before.

5. (Extemporaneous).—*a.* From sal ammoniac, 1 dr.; pure potassa, 3 drs.; grind them together, and add, of essence of lemons, 15 drops; oil of cloves, 3 or 4 drops.—*b.* From

carbonate or sesquicarbonate of ammonia (bruised), q. s.; volatile ammoniacal essence, a few drops. (See page 465.)

According to Dr. Paris, GODFREY'S SMELLING SALTS are made by resubliming volatile salt with subcarbonate of potassa and a little spirits of wine (and essential oil).

SALVE. A name indiscriminately applied by the vulgar to any consistent, greasy preparation used in medicine.

Salve, Lip. *Syn.* CERATUM LABIALE, L.

Prep. 1. (RED or PERUVIAN.) From spermaceti ointment, $\frac{1}{2}$ lb.; alkanet root, $\frac{1}{2}$ oz.; melt them together until sufficiently coloured, strain, and, when the strained fat has cooled a little, add of balsam of Peru, 3 drs.; stir well, and in a few minutes pour off the clear portion from the dregs; lastly, stir in of oil of cloves, 20 or 30 drops. This never gets rancid.

2. (ROSE.) See CERATE.

3. (WHITE.) From the finest spermaceti ointment or cerate, 3 oz.; finely powdered white sugar, 1 oz.; neroli or essence de petit grain, 10 or 12 drops, or q. s.

Obs. Numerous formulæ are extant for lip-salves, as for other like articles, but the preceding are those generally employed in trade. The perfumes may be varied at will and the salve named after them. A very small quantity of finely powdered borax is occasionally added. FRENCH LIP-SALVE is said to contain alum, in fine powder; and GERMAN LIP-SALVE is said to be made of cacao butter. See CERATE, POMMADE, and OINTMENT.

SAND. *Syn.* ARENA, L. River and sea sand consist chiefly of finely divided siliceous matter, mixed, occasionally, with carbonate of lime. That of Lynn and Alum Bay is nearly pure silica, and is, therefore, selected for the manufacture of glass. Sand is used by masons in metal, and as a manure for heavy land. It is a large and necessary portion of every fertile soil.

SANDAL WOOD. 1. (RED SANDERS WOOD. R. SAUNDERS W.; LIGNUM SANTALI RUBRUM; LIGNUM SANTALINUM RUBRUM, PTEROCARP—Ph. L. & E.) The wood of *Pterocarpus santalinus*. It is used in medicine as a coloring matter. It is also employed in dyeing and to stain varnishes. WOOD may be dyed carmine red by dipping it alternately into an infusion of this wood and an acidulous bath (Trommsdorff). Prepared with a mordant of alum and tartar, and then dyed in a bath of sandal wood and sumach, it takes a reddish-yellow. (Bancroft.) See SANTALIN.

2. (WHITE SANDAL WOOD, WHITE SANDERS SANTALUM ALBUM.) The young timber, or according to others, the outside wood of *Santalum album* (Linn.).

3. (YELLOW SANDAL WOOD; SANTALUM CITRINUM, S. FLAVUM.) The old timber, or according to others, the heart of the same tree. Both the latter are much esteemed for

account of their fragrant essential oil.

SANDARACH. *Syn.* Sandrac, and yield a valuable resin obtained from *m. SANDRAC, GUM S. A. Juniperus communis* (Thuja articulata, and slightly fragrant, is in warm climates). It is spirit, and has a sp. freely soluble in rectified used as incense, powder, gr. of 1.05 to 1.09. It is **SANDERS WOOD.** Lince, in varnishes, &c.

SANDIVER. *See SANDAL WOOD.*
VITRI, SAL VITRI. *Syn.* GLASS GALL; FELL swims on glass &c. L. The saline scum that sionally used in when first made. It is occasionally used in smooth-powders.

SANGUINARIA. Obtained from *LINE. Syn. SANGUINARINA, E. densis* (Linn.), of the root of *Sanguinaria Cana-* anhydrous alcohol blood-root, by digesting it in sulphuric acid; cool; exhausting it with weak monia; dissolving out by ether, and precipi- of sulphuric.

juice and acetic acid. The sulphate may be de- composed by ammonia, which precipitates the alkaloid as a white pearly substance, of an acid taste, very soluble in alcohol, also soluble in ether and volatile oils. With acids it forms soluble salts, remarkable for their beautiful red, crimson, and scarlet colours. These salts are used in medicine as expectorants, in doses of fractions of a grain.

The 'sanguinarin' of the American 'Eclectics' is prepared by precipitating a saturated tincture of blood-root by water. It contains an uncertain proportion of the alkaloid, and is of a deep reddish-brown colour. *See RESIN-IDS.*

SANTALIN. The colouring principle of red sanders wood.

SANTONIN. $C_{15}H_{15}O_9$. *m. SANTONIC* acid; **SANTONINUM, L.** The crystalline and characteristic principle of the seed of several varieties of *Artemisia*.

Prep. (Ph. Baden. 1841.) Take of worm- seed, 4 parts; hydrate of lime, $1\frac{1}{2}$ part; mix, and exhaust them with alcohol of 90%; distil off 3-4ths of the spirit, and evaporate the remainder to one half, which, at the boiling temperature, is to be mixed with acetic acid in excess, and afterwards with water; on repose, impure santonine subsides; wash this with a little weak spirit, then dissolve it in rectified spirit, 10 parts, decolour by ebullition for a few minutes with animal charcoal, and filter; the filtrate deposits colourless crystals of santonine as it cools; these are to be dried, and kept in opaque bottles.

Prop., &c. Prismatic or tabular crystals; odorless; tasteless, or only slightly bitter; fusible; volatilisable; soluble in 4500 parts of cold and about 250 parts of boiling water; soluble in cold alcohol and ether; freely soluble in hot alcohol. It is much esteemed as a tasteless worm medicine, and is especially adapted to remove lumbricals (large round worms).—*Dose.* 6 to 18 or 20 grs., repeated night and morning, followed by a brisk purge.

SAP GREEN. *See GREEN PIGMENTS.*

SAPONIFICATION. *See SOAP.*

SAPONIN. *Syn.* SAPONINUM, L. A white non-crystallisable substance, obtained by the action of hot diluted alcohol on the root of *Saponaria officinalis* (Linn.), or soap wort.

Prop., &c. Saponin is soluble in hot water, and the solution froths strongly on agitation. The smallest quantity of the powder causes violent sneezing.

SARCOCOLLA. A gum-resin supposed to be derived from one or more plants of the natural order *Renaceae*, growing in Arabia and Persia. It somewhat resembles gum arabic, except in being soluble in both water and alcohol, and in having a bitter-sweet taste. It was formerly used in surgery.

SAR'COSINE. $C_3H_7O_2N$. A feebly basic substance, obtained by boiling kreatine for some time with a solution of pure baryta. It forms colourless, transparent plates, freely soluble in water, sparingly so in alcohol, and insoluble in ether; it may be fused and volatilised.

SARSAPARILLA. *Syn.* SARSÆ RADIX (B. P.), RADIX SARSÆ, RADIX SARSAPARILLÆ, SARZA (Ph. L. & E.), SARSAPARILLA (Ph. D. & U. S. L.), "Jamaica sarza. The root of *Smilax officinalis*, Kunth" (Ph. L.); "and probably of other species." (Ph. E.)

The sarsaparillas of commerce are divided by Dr. Pereira into two classes:—'Mealy sarsaparilla' and 'non-mealy sarsaparillas.' In the first are placed Brazilian or Lisbon, Caracas or gouty Vera Cruz, and Honduras; the second includes Jamaica, Lima, and true Vera Cruz.

The mealy sarsaparillas are distinguished by "the mealy character of the inner cortical layers, which are white or pale-coloured. The mealy cortex is sometimes so abundant, that a shower of it, in the form of white dust, falls when we fracture the roots." The medulla or pith is also frequently very amyloaceous.

The non-mealy sarsaparillas "are characterised by a deeply coloured (red or brown), usually non-mealy, cortex. The cortex is red, and much thinner than in the mealy sorts." "If a drop of oil of vitriol be applied to a transverse section of the foot of the non-mealy sarsaparillas, both cortex and wood acquire a dark-red or purplish tint;" whilst in the preceding varieties, the mealy coat, and, sometimes, the pith, is but little altered in colour. "The decoction of non-mealy sarsaparilla, when cold, is somewhat darkened, but does not yield a blue colour when a solution of iodine is added to it." The aqueous extract, when rubbed down with a little cold distilled water in a mortar, does not yield a turbid liquid, nor become blue on the addition of iodine. The reverse is the case with the decoction and extract of the mealy varieties.

The JAMAICA, RED JAMAICA, or RED-BEARDED SARSAPARILLA (SARZA JAMAICENSIS—Ph. D.), is the variety which should alone be used in medicine. This kind yields from

Dover's powder. In malignant scarlet fever a smart emetic should be given early, and mercurials and diaphoretics at once freely exhibited. Acidulated gargles may be used for the throat, and, when the heat of the body is much above the natural standard, sponging the whole body with cold water, or with vinegar-and-water, may be had recourse to. If the malignant symptoms run high, and assume a typhoid or putrid character, the system must be supported with stimulant tonics, as, wine, bark, capicum, &c.

According to Hahnemann, Koreff, and Randhahn, belladonna is a prophylactic against scarlet fever. The homoeopaths also hold it to be almost a specific in the disease.

Scarlet fever is common to all ages of life, but children and young persons are the most subject to it. Unlike the smallpox, it occasionally attacks the same person more than once. It is most common in dirty, close, damp situations.

SCENE-PAINTING. A variety of distemper painting employed in theatres, &c., governed by perspective, and having for its object the production of striking effects when viewed at a distance. Water, size, turpentine, and the ordinary pigments, are the materials used for the purpose.

SCENT BAGS. See **SACHETS**.

SCENT BALLS. *Syn.* **PASTILLES DE TOILETTE ODORANTES**, Fr. These are prepared from any of the materials noticed under **POTBEI**, **SCENTED POWDERS**, and **SACHETS**, made into a paste with mucilage of gum tragacanth, and moulded into any desired forms, as that of balls, beads, medallions, &c. The larger ones are frequently polished.

SCENTED CAS'SOLETTES. See **POT POURRI**, and *above*.

SCENTS (Pommade). *Prep.* 1. (**COWSLIP**.) From essence of bergamot, 8 oz.; essence of lemon, 4 oz.; oil of cloves, 2 oz.; essence de petit grain, 1 oz.

2. (**JONQUILLE**.) From essence of bergamot and lemon, of each, 8 oz.; oils of orange peel and cloves, of each, 2 oz.; oil of sassafras, 1 oz.; liquid storax, $\frac{1}{2}$ oz.; digest, with warmth and agitation, for a few hours, and decant the clear portion in a week.

3. (**MILLEFLEUR**.) From essence of ambergris (finest), 4 oz.; essence of lemon, 3 oz.; oil of cloves and English oil of lavender, of each, 2 oz.; essence de petit grain, essence of bergamot, and balsam of Peru (genuine), of each, 1 oz.; as the last.

Obs. The above are employed to scent pomatums, hair oils, &c. 1 oz. of any one of them, dissolved in 1 pint of the strongest rectified spirit, produces a delicious perfume for the handkerchief.

SCENTS (Snuff). *Prep.* 1. Essence of bergamot, 2 oz.; otto of roses and neroli, of each, 1 dr.

2. Oil of lavender, 1 oz.; essence of lemon, 1 oz.; essence of bergamot, 4 oz.

3. To the last, add of oil of cloves, 2 oz.

4. Essence of musk and ambergris, of each, 1 oz.; liquor of ammonia, $\frac{1}{2}$ dr. See **SNUFF**, &c.

SCHEEL'S GREEN. See **GREEN PIGMENTS**.

SCHLIPPE'S SALT. Sulphantimoniate of sodium.

SCHWARTZ'S DROPS. See **WORM DROPS**.

SCIATICA. See **RHEUMATISM**.

SCILLITIN. *Syn.* **SCILLITINA**, **SCILLITITE**. A whitish, resinous, translucent, bitter, deliquescent substance, obtained by Vögel from squills. It is soluble in water, alcohol, and acetic acid, and is purgative, acrid, and poisonous.

SCORBU'TUS. See **SCURVY**.

SCOR'RIA. Dross; the refuse or useless part of any substance, more especially that left from bodies which have been subjected to the action of fire. It is frequently used in the plural (**SCORBLE**).

SCOTT'S DROPS. See **PATENT MEDICINES**.

SCOUR'ING. The common method of cleaning cloth is by beating and brushing it, unless it be very dirty, when it undergoes the operation of scouring. This is best done on the small scale, as with **ARTICLES OF WEARING APPAREL**, as follows:—A little curd soap is dissolved in water, and, after mixing it with a little clarified ox-gall, is applied to all the spots of grease, dirt, &c., and well rubbed into them with a stiff brush until they appear to be removed; after which the article is well cleaned all over with a brush or sponge dipped into some warm water, to which the previous mixture and a little more ox-gall has been added. The cloth is next thoroughly rinsed in clean water, and hung up to dry. For dark-coloured cloths, some fuller's earth is often added to the mixture of soap and gall. When the article is nearly dry, the nap is laid smooth, and it is carefully pressed (if with a hot iron, on the wrong side), after which a soft brush, moistened with a drop or two of olive oil, is frequently passed over it, to give it a finish and gloss.

Cloth is also cleaned in the dry way:—The spots being removed, as above, and the wetted parts having become dry, clean damp sand is strewn over it, and beaten into it with a brush, after which the article is well gone over with a hard brush, when the sand comes out, and brings the dirt with it.

BUFF and **DRAB CLOTH** is generally cleaned by covering it with a paste made with pipe-clay and water, either with or without a little umber to temper the colour, which, when dry, is rubbed and brushed off.

When the article requires renovation as well as scouring, it is placed, whilst still damp, on a board, and the threadbare parts are rubbed with a half-worn hatter's card filled with flocks, or with a teasel, or a prickly thistle, until a nap is raised; it is next hung up to dry, after which it is 'finished off' as before. When the

cloth is much faded, it is usual to give it a 'dip,' as it is called, or to pass it through a dye bath to freshen up the colour. BLACK and DARK BLUE CLOTH, if rusty or faded, is commonly treated to a coat of 'reviver,' instead of being 're-dipped,' and is then hung up until next day, before being pressed and finished off. See SPOTS and STAINS.

SCOURING DROPS. See DROPS.

SCUDAMORE'S LOTION. See GOUT LOTION.

SCURF. *Syn.* FURFURA. Scurf "is a natural and healthy formation, and though it may be kept from accumulating, it cannot be prevented. It is produced on every part of the body where hair is found, although, from the more active growth of hair on the scalp, the facilities for collecting, and the contrast of colour, it strikes the eye most disagreeably in that situation. This will show how futile any attempt must be which shall have for its object to prevent the formation of the scurf. It may be removed, and should be removed, every day, with the hair-brush; but prevention is impossible, inasmuch as it is opposed to a law of nature. Occasionally, as a morbid action, an unusual quantity of scurf is produced, in which case medical means may be adopted to bring the scalp into a more healthful state." (Eras. Wilson.) In such cases the daily use of some mild stimulating or detergent wash, with due attention to the stomach and bowels, will generally abate this annoyance.

SCURVY. *Syn.* SCORBUTUS, L. This disease commences with indolence, sallow looks, debility, and loss of spirits; the gums become sore and spongy, the teeth loose, and the breath fetid; the legs swell, eruptions appear on different parts of the body, and, at length, the patient sinks under general emaciation, diarrhoea, and hæmorrhages.

The treatment of ordinary cases of this disease mainly consists in employing a diet of fresh animal and green vegetable food, with mild ale, beer, or lemonade, as beverages; scrupulously avoiding salted and dried meat. The fresh-squeezed juice of lemons is, perhaps, of all other substances, the most powerful remedy in this disease in its early stages, and is useful in all of them. Effervescent draughts formed with the bicarbonate of potassa (not soda) are also excellent.

SEALING WAX. See WAX.

SEA SICKNESS. The most effectual preventive of sea sickness appears to be the horizontal position. When there is much pain, after the stomach has been well cleared, a few drops of laudanum may be taken, or an opium plaster may be applied over the region of the stomach. Persons about to proceed to sea should put their stomach and bowels in proper order, by the use of mild aperients, and even an emetic, if required, when it will generally be found that a glass of warm and weak brandy-and-water, to which 15 or 20 drops of

laudanum, or, still better, 1 or 2 drops of creasote, have been added, will effectually prevent any disposition to sea sickness, provided the bowels be attended to, and excess in eating and drinking be at the same time avoided. A spoonful of crushed ice, in a wine-glassful of cold water, or weak brandy-and-water, will often afford relief when all other means fail. Smoking at sea is very apt to induce sickness. M. F. Curie, in the *Comptes Rendus*, asserts that drawing in the breath as the vessel descends, and exhaling it as it ascends, on the billows, by preventing the movements of the diaphragm acting abnormally on the phrenetic nerves, prevent sea sickness. On this Mr. Atkinson, at one of the meetings of the British Association, observed that—if a person, seated on board ship, holding a tumbler filled with water in his hand, makes an effort to prevent the water running over, at the same time allowing not merely his arm, but also his whole body, to participate in the movements, he will find that this has the effect of preventing the giddiness and nausea that the rolling and tossing of the vessel have a tendency to produce in inexperienced voyagers. If the person is suffering from sickness at the commencement of his experiment, as soon as he grasps the glass of liquid in his hand, and suffers his arm to take its course and go through the movements alluded to, he feels as if he were performing them of his own free will, and the nausea abates immediately, and very soon ceases entirely, and does not return so long as he suffers his arm and body to assume the postures into which they seem to be drawn. Should he, however, resist the free course of his hand, he instantly feels a thrill of pain, of a peculiarly stunning kind, shoot through his head, and experiences a sense of dizziness and returning nausea.

SEDATIVES. *Syn.* SEDATIVA, L. Medicines and agents which diminish the force of the circulation or the animal energy, and allay pain. Foxglove, henbane, tobacco, potassio-tartrate of antimony, and several of the neutral salts and acids, act as sedatives. Cold is, perhaps, the most powerful agent of this class.

SEED. *Syn.* SEMEN, L. The seeds of plants are conspicuous for their vast number and variety, and their extreme usefulness to man. The seeds of certain of the *Graminaceæ* furnish him with his daily bread; some of those of the *Leguminosæ*, in either the immature or ripe state, supply his table with wholesome esculents, or provide a nourishing diet for his domestic animals; whilst those of numerous other plants, dispersed through every class, order, and family, yield their treasures of oil, medicinals, or perfumes, for his use.

SELENIC ACID. H_2SeO_4 . *Syn.* ACIDUM SELENICUM, L. *Prep.* By fusing selenium with nitrate of potassium or of sodium, acting on the fused mass with water, precipitating the resulting solution with acetate or nitrate of

permanent straw-yellow colour when steeped in nitric acid of the sp. gr. 1.20 to 1.30. The fibres of white or light coloured silk are similarly stained by a solution of picric acid. A thread of silk, when inflamed, shrivels and burns with difficulty, evolves a peculiar odour, and leaves a bulky charcoal. By these properties silk is distinguished from cotton and linen.

The cleaning and renovation of articles of wearing apparel made of silk are matters requiring some care. No silk goods look well after being washed, however carefully it may be done; and this method should therefore never be resorted to but from absolute necessity. It is recommended to sponge faded silks with warm water and curd soap, then to rub them with a dry cloth on a flat board, and afterwards to iron them on the wrong side with an ordinary smoothing iron. Sponging with spirit, benzol, or pure oil of turpentine, also greatly improves old silk, and is often preferable to any other method. The odour of the benzol passes off very quickly, that of the turpentine after exposure for a few days. When the ironing is done on the right side, thin paper should be spread over the surface, to prevent 'glazing.' See DYEING, GILDING, &c.

SILK WORM GUT. See GUT.

SILLABUB. *Prep.* Grate off the yellow peel of a lemon with lump sugar, and dissolve the sugar in $\frac{1}{2}$ pint of wine; add the juice of $\frac{1}{2}$ a lemon, and a $\frac{1}{4}$ pint of cream; beat the whole together until of a proper thickness, and then put it into glasses.

Obs. $\frac{1}{2}$ to 1 pint of new milk is often substituted for the cream, and strong cider or perry for the wine. Grated nutmeg is often added. When 'whipped' to a froth, it is called 'WHIPPED SILLABUB.' See CREAM (Whipped).

SILVER. *Ag. Syn.* ARGENTUM, L. This metal, like gold, appears to have been as much valued in the remotest ages of antiquity of which we have any record, as at the present time. It is found in nature both in the metallic state and mineralised, in the state of alloy, and combined with sulphur, chlorine, and other metallic sulphurets. In Great Britain it is found in combination chiefly with lead. It is extracted from its ores principally by the process of amalgamation, founded on its easy solubility in mercury, and by subsequent cupellation. It is only prepared on the large scale.

Chemically pure silver may be obtained by the methods noticed subsequently.

Prop. Pure silver has a very white colour, high degree of lustre, is exceedingly malleable and ductile, and is the best conductor of heat and electricity known. Its hardness is between that of copper and gold; its sp. gr. is 19.475 to 19.500; it melts at about 1873° Fahr., or bright redness (Daniell); is freely soluble in nitric acid, and dissolves in sul-

phuric acid by the aid of heat; it refuses to oxidise alone at any temperature, but, when strongly heated in open vessels, it absorbs many times its bulk of oxygen, which is again disengaged at the moment of solidification; its surface is rapidly tarnished by sulphuretted hydrogen and by the fumes of sulphur.

Pur. "Entirely soluble in diluted nitric acid. This solution, treated with an excess of muriate of soda, gives a white precipitate entirely soluble in ammonia water, and a fluid which is not affected by sulphuretted hydrogen." (Ph. E.)

Tests. F. The compounds of silver, mixed with carbonate of soda, and exposed on a charcoal support to the inner flame of the blowpipe, afford white, brilliant, and ductile metallic globules, without any incrustation of the charcoal.—2. The salts of silver are non-volatile and colourless, but most of them acquire more or less a black tint by exposure to full daylight.

The soluble salts of silver give—1. A white curdy precipitate (chloride of silver) with hydrochloric acid and the soluble metallic chlorides, which is soluble in ammonia and insoluble in nitric acid, and blackened by exposure to light; 2. White precipitates with solutions of the alkaline carbonates, oxalates, and ferrocyanides;—3. Yellow precipitates with the alkaline arsenites and phosphates;—4. With the arseniates, red precipitates;—5. With the fixed alkalies, brown precipitates;—6. With sulphuretted hydrogen and hydro-sulphuret of ammonia, a black powder, which is insoluble in dilute acids, alkalies, alkaline sulphurets, and cyanide of potassium, but readily soluble, with separation of sulphur, in boiling nitric acid; and—7. With phosphorus, and with metallic copper or zinc, pure silver.

Assay. 1. The method of assaying silver by cupellation has been explained under ASSAY and CUPELLATION; and that method is alone applicable when the alloy contains a very small quantity of silver, as a few ounces only per ton. When the reverse is the case, as with the silver of commerce, the following is a much more accurate method:—

2. *Humid assay of silver.*—a. Dissolve 10 grs. of the silver for assay in 100 grs. of nitric acid, sp. gr. 1.28, by the aid of heat, the solution being made in a tall stoppered glass tube, furnished with a foot; then place it in a very delicate balance, bring it into an exact state of equilibrium, and add the test solution (see below), gradually and cautiously, until the whole of the silver be thrown down; the number of grains now required to restore the equilibrium of the balance or scales gives the exact quantity of pure silver in 1000 parts of the sample.—*Obs.* To ensure accuracy, after each addition the stopper should be placed in the tube, and the latter violently agitated for a short time, when the liquor will rapidly clear and enable us to see when the operation

is concluded. We must then, as a check, add a small quantity of a solution of nitrate of silver to the liquor in the tube, after having first carefully taken the weight. If too much of the test liquor has been added, this will produce a fresh precipitate, and the assay cannot then be depended on.—Instead of weighing the quantity of test liquor used, a tube graduated into 100 parts, and holding 1000 grs., may be employed, every division of which required to throw down the silver, will represent the $\frac{1}{1000}$ th of a grain. See ALKALIMETRY and ACIDIMETRY.

b. The precipitate of chloride of silver may be collected in a paper filter, and be dried, washed, fused, and weighed. The previous weight of the paper, deducted from the gross weight of the filter and its contents, gives the quantity of chloride of silver present, which, multiplied by 0.75278, gives the weight of the pure silver in the sample.

Test liquor. Dissolve 54.27 (54 $\frac{1}{2}$) grs. of pure sea salt in 9945.73 grs. (or 22 oz. and 320 $\frac{3}{4}$ grs. avoirdupois) of distilled water; filter, and keep the liquor in a stoppered bottle for use. Pure sea salt is obtained by boiling together, for a few minutes, in a glass vessel, a solution of common salt with a little pure bicarbonate of soda; then adding to the filtered liquor sufficient hydrochloric acid to render it neutral to litmus and turmeric paper, and, lastly, evaporating and crystallising.

Obs. The presence of mercury, lead, or sulphuret of silver, interferes with the accuracy of the above assay. When mercury is present, the precipitate blackens less readily by exposure to light; and when it contains $\frac{1}{1000}$ or $\frac{1}{10000}$ of chloride of mercury, it remains of a dead white; with $\frac{1}{1000}$ it is not sensibly discoloured by the diffused light of a room, with $\frac{1}{1000}$ only slightly darkened, with $\frac{1}{1000}$ more so, but with pure chloride of silver, the effect is very rapid and intense. When this metal is present, which is, however, seldom the case, the assay sample must be placed in a small crucible, and exposed to a full red heat, before solution in the acid. Another method, proposed by M. Levöl, and modified by M. Gay-Lussac, is to add to the nitric solution of the silver sufficient acetate of ammonia or crystallised acetate of soda to saturate all the nitric acid existing in the liquor, either in the free state or combined with the silver. When the alloy contains lead, shown by the precipitated chloride being partly soluble in water, it may either be laminated and subjected to the action of acetic acid before solution in the nitric acid; or, the test solution of chloride of soda should be replaced by one of chloride of lead; (139.355 grs. of the latter are equiv. to 58.732 grs. of the former). The presence of sulphuret of silver is detected whilst dissolving the sample in nitric acid, by the black floc which may be observed floating about the liquor in an insoluble state. The flocs may be dissolved by fuming

nitric acid, or by adding pure concentrated sulphuric acid to the solution, which should be then heated for about a $\frac{1}{2}$ hour in a steam-bath. When thus treated, the precipitate produced by the test liquor represents the whole of the silver contained in the alloy.

Uses, &c. Metallic silver, unless in a state of very minute division, has no action on the human body. A plate of silver is ordered, in the Ph. L., as a test of the presence of nitric acid in the acetic and phosphoric acids; and metallic silver (preferably granulated) is employed by the other colleges in the preparation of the nitrate. Its numerous applications in the arts are well known. The standard silver of England contains 111 parts of silver, and 9 parts of copper.

Concluding remarks. The researches of Tillet, D'Arcet, and Gay-Lussac, have clearly shown that the percentage of silver in an alloy, as indicated by cupellation, is always below its real richness in that metal, owing to loss in the process; and, that the cupelled button always retains a trace of lead and copper, the precise quantity of which is variable. The following Table exhibits the additions to be made on this score, when the quantity assayed (assay pound) is 20 grs. :—

Weight after cupellation.	Actual richness in pure silver.	Percentage of richness in pure silver.
19.979	20	100
18.95	19	95
17.92	18	90
16.917	17	85
15.914	16	80
14.91	15	75
13.905	14	70
12.905	13	65
11.906	12	60
10.906	11	55
9.906	10	50
7.921	8	40
5.948	6	30
3.949	4	20
1.982	2	10

In assaying lead ores very poor in silver, the best quantity to be taken for cupellation is 500 grs.; and from that quantity 0.0148 of silver, including compensation for loss, represents one ounce of silver to the ton. A cupel may absorb its own weight of lead. If the quantity of lead to be absorbed is more considerable, another cupel may be turned topsy-turvy, and the cupel in which the assay is to be made may be placed upon it. See ASSAY, and M. Gay-Lussac's elaborate memoir on the "*Humid Assay of Silver.*"

For the recovery or reduction of silver from the chloride and its other compounds, several methods are employed :—

a. The washed chloride is placed in a zinc or iron cup, along with a little water strongly acidulated with sulphuric acid; or in a glass or porcelain cup along with a zinc plate; the whole may then be left to itself for some hours; or, to hasten the reduction, gently heated, or even boiled; the precipitated silver is washed with pure water, and dried.

b. (Hornung.) Digest the chloride with some ammonia and pure copper filings, for 24 hours, then wash and dry the powder.

c. (M. Levöl.) The washed chloride is mixed with an equal weight of sugar, and the mixture is digested in an excess of a moderately strong solution of caustic potassa, with occasional agitation for 24 hours; or the whole is boiled for some time; the reduced silver is washed with distilled water.

d. (Mohr.) The dry chloride is mixed with 1-3rd of its weight of powdered black resin, and moderately heated in a crucible until the flame ceases to have a greenish-blue colour; the heat is then suddenly increased so as to melt the metal into a button or ingot.

e. (M. Gay-Lussac.) If the chloride, dry it, and throw it, in successive portions, into twice its weight of carbonate of potassa fused in a red-hot Hessian crucible; effervescence ensues, and the pure silver subsides to the bottom.—If a "soluble salt," as the nitrate, acidulate the solution, and precipitate it by means of a polished plate of copper; the silver is then obtained in the form of powder. The products of the above processes, when the latter are carefully conducted, are chemically pure silver.

Silver, Acetate of. *Syn.* ARGENTI ACETAS, *L.* *Prep.* By adding a solution of acetate of potassa to a like solution of nitrate of silver, washing the precipitate with cold water, redissolving it in a little hot water, and setting the solution aside to crystallise. Small colourless needles.

Silver, Ammoniuuret of. See FULMINATING SILVER (Berthollet's, Nos. 1 and 2, page 547).

Silver, Ammonio-chloride of. *Syn.* ARGENTO-CHLORIDE OF AMMONIA; ARGENTI AMMONIO-CHLORIDUM, *L.* *Prep.* Add, gradually, chloride of silver (recently precipitated and well washed) to concentrated liquor of ammonia, as long as it is dissolved on agitation, applying a gentle heat towards the end; then heat the solution to the boiling-point, concentrate a little, and allow it to cool very slowly; collect the crystals which form, dry them by pressure (with care) between folds of bibulous paper, and at once preserve them from the light and air.—*Dose.* $\frac{1}{4}$ to $\frac{1}{2}$ gr.

Silver, Benzoate of. $\text{AgC}_6\text{H}_5\text{O}_2$. Thin transparent plates, which are blackened by exposure to the light. See BENZOATE.

Silver, Bromide of. AgBr . Resembles the chloride.

Silver, Carbonate of. Ag_2CO_3 . *Syn.* ARGENTI CARBONAS, *L.* A white insoluble powder, obtained by precipitating a cold solution

of nitrate of silver with another of carbonate of sodium. It is decomposed by heat.

Silver, Chloride of. AgCl . *Syn.* ARGENTIC CHLORIDE. *Prep.* Precipitate a solution of nitrate of silver by dilute hydrochloric acid or a solution of common salt; wash the precipitate, and dry it in the shade.—*Dose.* $\frac{1}{4}$ to 3 grs., thrice daily; in epilepsy, chronic dysentery, cholera, diarrhoea, &c. Dr. Perry regards it as preferable to the nitrate. When fused, chloride of silver forms horn silver, the 'luna cornea' of the older writers.

Silver, Cyanide of. AgCN . *Syn.* ARGENTIC CYANIDE, HYDROCYANATE OF SILVER. *Prep.* Add dilute hydrocyanic acid to a solution of nitrate of silver, as long as a precipitate falls; wash this with distilled water, and dry it.

Prop., &c. Cyanide of silver is a white powder, soluble in ammonia, and decomposed by contact with vegetable substances; light turns it violet-coloured.—*Dose.* $\frac{1}{10}$ to $\frac{1}{2}$ gr.; in syphilis, &c. It has been proposed as a source of hydrocyanic acid. (Everitt.)

Silver Hyposulphite of. $\text{Ag}_2\text{S}_2\text{O}_3$. *Syn.* ARGENTI HYPOSULPHIS, *L.* A white substance, insoluble in water, and very prone to decomposition. It is very soluble in the alkaline hyposulphites, forming compounds possessing an intensely sweet taste. See HYPOSULPHUROUS ACID.

Silver, Iodide of. AgI . *Syn.* ARGENTIC IODIDE; ARGENTI IODIDUM, *L.* *Prep.* Precipitate a solution of nitrate of silver with another of iodide of potassium; wash the precipitate with distilled water, and dry it in the shade. Pale greenish-yellow; insoluble in water and in liquor of ammonia; soluble in a solution of hyposulphite of soda. *Used* in some of the French hospitals in the stomach affections of scrofulous subjects; also in epilepsy.—*Dose.* $\frac{1}{2}$ to 1 gr.

Silver, Nitrate of. AgNO_3 . *Syn.* ARGENTI NITRAS, *L.* This article is found in commerce under two forms:—

1. CRYSTALLISED. *Prep.* By dissolving grain silver in nitric acid diluted with about twice its weight of water, evaporating the solution until it is strong enough to crystallise on cooling, and then allowing it to cool very slowly. Colourless; transparent, anhydrous rhombic prisms or tables; soluble in an equal weight of cold and in half their weight of boiling water; soluble in alcohol; fuse when heated, and at a higher temperature suffer decomposition; blackened by light, and by contact with organic substances. Its solution in distilled water is not sensibly darkened by light, in the absence of organic matter. *Used* for solutions, and in photography.

2. FUSED (LUNAR CAUSTIC; ARGENTI NITRAS—B. P., Ph. L. & E., A. N. FUSUM—Ph. D.). *Prep.* (Ph. D.) Refined silver, 3 oz.; pure nitric acid, 2 fl. oz.; distilled water, 5 fl. oz.; mix in a glass flask, and apply a gentle heat until the metal is dissolved; transfer the solution to a porcelain capsule (or a large porcelain

vented by Dr. Arnott, will be found entirely successful, and most economical. Its general introduction would be a great advance in both domestic and public hygiene; and, being hence of national importance, should be enforced by law.

SMO'KING. This is done, on the large scale, by hanging up the articles (previously more or less salted) in smoking rooms, into which smoke is very slowly admitted from smothered dry-wood fires, kindled in the cellar, for the purpose of allowing it to cool and deposit its cruder part before it arrives at the meat. This process requires from six days to as many weeks to perform it properly, and is best done in winter. In farm-houses, where dry wood is burnt, hams, &c., are often smoked by hanging them up in some cool part of the kitchen chimney. When the meat is cut into slices, or scored deeply with a knife, to allow the smoke to penetrate it, it is called 'BUCANING.'

"The quality of the wood has an influence upon the smell and taste of the smoke-dried meat; smoke from beech wood and oak being preferable to that from fir and larch. Smoke from the twigs and berries of juniper, from rosemary, peppermint, &c., impart somewhat of the aromatic flavour of these plants." (Ure.) The occasional addition of a few cloves or allspice to the fuel gives a very agreeable flavour to the meat.

Hung beef, a highly esteemed variety of smoked beef, is prepared from any part, free from bone and fat, by well salting and pressing it, and then drying and smoking it in the usual manner. It is best eaten shredded. See PUTEFACTION, SALTING, &c.

SNAKE-ROOT. See **SENEGA**. For 'Virginian snake-root' see **SERPENTARY**. Snake-weed (*Bistorta radia*) is the root of *Polygonum Bistorta* (Linn.).

SNIPE. The *Scelopax Gallinago*, a well-known bird indigenous to this country. It is fine flavoured, but rather indigestible.

SNUFF. *Syn.* **PULVIS TABACI**, L.; **TABAC EN POUDRE**, Fr. A powder, prepared from tobacco, for the purpose of being sniffed up the nose as a stimulant or intoxicant.

The finer kinds of snuff are made from the best portions of the best description of manufactured leaf-tobacco, separated from the damaged portion; but the ordinary snuffs of the shops are mostly prepared from the coarser and damaged portions, the mid-ribs, stems, or stalky parts, that remain from the manufacture of 'shag tobacco,' the dust or powder sifted from the bales, and the fragments that are unfit for other purposes.

Prep. The proper material being chosen, and if not in a sufficiently mature state rendered so by further fermentation, they are sufficiently dried by a gentle heat or exposure to the air to admit of being pulverised. This is performed, on the large scale, in a mill, and on the small scale, with a kind of pestle and mortar. During the operation the tobacco is

frequently sifted, that it may not be reduced to too fine a powder, and is several times slightly moistened with rose or orange-flower water, or eau d'ange, which are the only liquids fit for the superior kinds of snuff. In preparing the dry snuffs, no moisture is used. The scent or other like matters are next added, and, after thorough admixture, the snuff is packed in jars or canisters.

Adult. During the grinding of tobacco it is frequently mixed with dark-coloured rotten wood, various English leaves, colouring, and other matter. Ammonia, hellebore, euphorbium, and powdered glass, are common additions to snuffs to increase their pungency. We have seen powdered sal ammoniac sent by the hundredweight at one time to a certain celebrated London tobacconist. The moist kinds of snuff are generally drugged with pearlash, for the triple purpose of keeping them damp and increasing their pungency and colour. The dry snuffs, especially 'Scotch' and 'Welsh,' are commonly adulterated with quicklime, the particles of which may be occasionally distinguished even by the naked eye. This addition causes their biting and desiccating effect on the pituitary membrane. "We were once severely injured by taking snuff which, after our suspicions were awakened, we found to contain a mixture of red lead and umber." (Cooley.)

Var. Snuffs are divided into two kinds—**DRY SNUFFS**, as 'Scotch,' 'Irish,' 'Welsh,' and 'Spanish snuff,' 'Lundyfoot,' &c.; and—**MOIST SNUFFS**, or **RAPPEES**, including 'black' and 'brown rappee,' 'carotte,' 'Cuba,' 'Hardham's mixture,' 'prince's mixture,' 'princeza,' 'queen's snuff,' &c. The last three also come under the denomination of **SCENTED SNUFFS**.

The immense variety of snuffs kept in the shops, independently of the above-named conditions, depend for their distinguishing characteristics on the length of the fermentation, the fineness of the powder, the height to which they are dried, and the addition of odorous substances. Tonquin beans, essence of tonquin bean, ambergris, musk, civet, leaves of orchis fusca, root and oil of calamus aromaticus, powder and essence oforris root, and the essences or oils of bergamot, cedar, cloves, lavender, petit grain, neroli, and roses (otto), as well as several others, either alone or compounded, are thus employed. **TABAC PARFUMÉE AUX FLEURS** is perfumed by putting orange flowers, jasmins, tuberoses, musk roses, or common roses, to the snuff in a close chest or jar, sifting them out after 24 hours, and repeating the treatment with fresh flowers, as necessary. Another way is to lay paper, pricked all over with a large pin, between the flowers and the snuff.

MACOUBA SNUFF is imitated by moistening the tobacco with a mixture of treacle and water, and allowing it to ferment well.

SPANISH SNUFF is made from unsifted 'Havannah snuff,' reduced by adding ground

Spanish nutshells, sprinkling the mixture with treacle water, and allowing it to sweat for some days before packing.

YELLOW SNUFF is prepared from ordinary pale snuff moistened with a mixture of yellow ochre diffused in water, to which a few spoonfuls of thin mucilage have been added; when dry, the colour that does not adhere to the snuff is separated with a fine sieve.

RED SNUFF. As last, but using red ochre.

SNUFF, ASARABACCA. *Syn.* CEPHALIC SNUFF, COMPOUND POWDER OF ASARABACCA; PULVIS ASARI COMPOSITUS, L. *Prep.* 1. (Ph. D. 1826.) Asarabacca leaves, 1 oz.; lavender flowers, 1 dr.; (both dried;) mix and powder them.

2. (Ph. E. 1817.) Asarabacca leaves, 3 drs.; leaves of marjoram and flowers of lavender, of each, 1 dr.; as before. Both are used as erlincs in headaches and ophthalmia. See CEPHALIC SNUFF, ASARABACCA, &c.

SNUFF, CHEPHALIC. *Prep.* 1. From asarabacca leaves and Lundyfoot snuff, of each, 2 oz.; lavender flowers, $\frac{1}{2}$ oz.; essence of bergamotte and oil of cloves, of each, 2 or 3 drops; mixed and ground to a powder, the perfume being added last.

2. (Boeli's.) From tobacco or pure snuff and valerian root, of each, $\frac{1}{2}$ oz.; reduced to powder, and scented with the oils of lavender and marjoram, of each, 5 or 6 drops.

Obs. The first formula is an excellent one; and the product is very useful in nervous headaches, dimness of sight, &c. See ASARABACCA SNUFF (*above*).

SNUFF, EYE. *Prep.* From finely levigated tribasic sulphate of mercury ('Turpeth mineral'), $\frac{1}{2}$ dr.; pure dry Scotch or Lundyfoot snuff, 1 oz.; triturate them well together. A pinch of this, occasionally, has been recommended in inflammation of the eyes, dimness of sight, headache, polypus, &c.; but it should be used with caution, and not too often.

SOAP. *Syn.* SAPO, L.; SAVON, Fr. SPANISH, CASTILE, or HARD SOAP, made with olive oil and soda (SAPO, SAPO EX OLIVÆ OLEO ET SODÆ CONFECTUS—Ph. L.; SAPO DURUS—B. P., Ph. E. & D.), and SOFT SOAP, made with olive oil and potash (SAPO MOLLIS—B. P., Ph. L. & E., SAPO EX OLIVÆ OLEO ET POTASSÆ CONFECTUS—Ph. L.), are the only kinds directed to be employed in medicine. The former is intended whenever 'soap' is ordered, and is the one which is principally employed internally; the latter is used in ointments, &c., and in some of the official pills.

Prep. The fatty or oleaginous matter is boiled with a weak alkaline lye (soap-lye) numbered caustic by quicklime, and portions of stronger lye are added from time to time, the ebullition being still continued, until these substances, reacting on each other, combine to form a tenacious compound, which begins to separate from the water; to promote this separation and the granulation of the newly

formed soap, some common salt is generally added, and the fire being withdrawn, the contents of the boiler are allowed to repose for some hours, in order that the soap may collect into one stratum, and solidify; when this happens it is put into wooden frames or moulds, and when it has become stiff enough to be handled it is cut into bars or pieces, and exposed to the air, in a warm situation, to further harden and to dry.

Var. The principal varieties of soap found in commerce are:—

ALMOND SOAP (SAPO AMYGDALINUS), made from almond oil and caustic soda, and chiefly used for the toilet.

CASTILE SOAP, SPANISH S., MARSEILLES S.; SAPO CASTILLIENSIS, SAPO HISPANICUS. A olive-oil soda soap, kept both in the white and marbled state. The former is said to be the purest; the latter, the strongest.

CURD SOAP, made with tallow (chiefly) and soda.

MEDICATED SOAPS, containing various active ingredients. The chief of these are noticed *below*.

MOTTLED SOAP, made with refuse kitchen stuff, &c.

SOFT SOAP (of commerce), made with whale, seal, or cod oil, tallow, and caustic potash.

TOILET SOAPS, prepared from any of the preceding varieties, and variously coloured and scented. Formulas are given *below*.

YELLOW SOAP, RESIN SOAP, made with tallow, resin, and caustic soda. Soluble glass is now largely employed in place of resin.

Soaps are also divided into SOFT or POTASH SOAPS and HARD or SODA SOAPS.

Assay. 1. For the WATER. A piece, fairly taken from the sample, and weighing 100 grs., is reduced to thin shavings, which are dried by the heat of boiling water, until they cease to lose weight. The loss indicates the proportion of free water. This should not exceed 35% for ordinary curd and mottled soap, 40% for yellow soap, and about 15 to 16% for Castile soap.

2. For the ALKALI. 100 grs. of the soap are dissolved in 4 or 5 fl. oz. of boiling water, and the solution tested by the common method of alkalimetry. Curd and yellow soap usually contain from 6 to 7%, mottled soap from 7 to 8%, and Castile soap 8 to 9% of soda.

3. For the OIL or FAT. The solution tested for alkali (see No. 2) is heated, and then allowed to cool slowly; when cold, the floating fatty matter is removed, freed from water, and weighed. When the fat or oil has little assistance, 100 grs. of pure white wax is added to the soap solution, before heating it. The weight obtained, in grains in the one case, and the excess above 100 grs. in the other, give the proportion of oil or fat present. This, in ordinary mottled soap, should be about 6 lbs. in yellow soap, 65%; in curd soap, 60%; and in Castile soap, 75%.

4. UNSAPONIFIED FATTY MATTER.—*a.* Pure soap is entirely soluble in distilled water and insoluble in saline solution; if a film of fatty matter forms on its solution in the former, after repose, that portion has not been saponified.

b. The fat separated from soap (see No. 2), when it has been perfectly saponified, is entirely soluble in alcohol.

5. OTHER IMPURITIES. Pure soap is soluble in rectified spirit, forming a colourless or nearly colourless solution. The undissolved portion, if exceeding 1%, is adulteration.

Uses, &c. The common uses of soap need not be enumerated. As a medicine, it acts as a mild purgative and lithontriptic, and it has been thought by some to be useful in certain affections of the stomach arising from deficiency of bile. *Externally*, it is stimulant and detergent.—*Dose.* 3 to 20 or 30 grs., made into pills, and usually combined with aloes or rhubarb.

Concluding remarks. Prior to the researches of Chevreul, no correct ideas were entertained as to the constitution of soap. It was long known that the fixed oils and fats, in contact with caustic alkaline solutions at a high temperature, undergo the remarkable change which is called saponification; but here the knowledge of the matter stopped. Chevreul discovered that if the soap, so produced, be afterwards decomposed by the addition of an acid, the fat which separates is found to be completely changed in character; to have acquired a strong acid reaction when applied in a melted state to test paper, and to have become soluble with the greatest facility in warm alcohol; in other words—that a new substance, capable of forming salts, and exhibiting all the characteristic properties of an acid, has been generated out of the elements of the neutral fat under the influence of the base. Stearin, when thus treated, yields stearic acid, palmitin gives palmitic acid, olein gives oleic acid, and common animal fat, which is a mixture of several neutral bodies, affords, by saponification by an alkali and subsequent decomposition of the soap, a mixture of the corresponding fatty acids. These bodies are not, however, the only products of saponification; the change is always accompanied by the formation of a very peculiar sweet substance, called glycerin, which remains in the mother-liquor from which the acidified fat has been separated. The process of saponification itself proceeds with perfect facility, even in a closed vessel; no gas is disengaged; the neutral fat, of whatsoever kind, is simply resolved into an alkaline salt of the fatty acid, which is soap, and into glycerin, a neutral body resembling syrup, and, like that liquid, miscible with water in every proportion.

"When yellow soap is made with the cheaper kinds of fat, it will hardly acquire a sufficient degree of firmness or hardness to satisfy the

thrifty washerwoman. It melts away too rapidly in hot water, a defect which may be well remedied by the introduction into the soap of a little (1-20th) fused sulphate of soda; and this salt concreting, gives the soap a desirable hardness, whilst it improves its colour, and renders it a more desirable article for the washing tub." (Ure.) This process was patented by Dr. Normandy, but soon proved a source of annoyance and molestation to him on the part of the Board of Excise, it being an enormous crime in law to attempt to improve and cheapen soap.

"Soda which contains sulphurets is preferred for making mottled or marbled soap, whereas the desulphuretted soda makes the best white curd soap." "The Barillas always contain a small proportion of potash, to which their peculiar value, in making a less brittle or more plastic hard soap than the factitious sodas, may, with great probability, be ascribed." (Ure.)

The mottled appearance is usually given, in the London Soap-works, by watering the nearly finished soap with a strong lye of crude soda, by means of a watering can furnished with a rose spout. For 'Castile soap,' a solution of sulphate of iron is so employed. See SOAPS (Medicated and Toilet).

Soap, Arsenical. *Syn.* SAPO ARSENICALIS, L. *Prep.* (Béccours.) From carbonate of potash, 12 oz.; white arsenic, white soap, and air-slaked lime, of each 4 oz.; powdered camphor, $\frac{1}{2}$ oz.; made into a paste with water, q. s. *Used* to preserve the skins of birds, and other small animals.

Soap, Black. *Syn.* SAPO NIGER, S. MOLLIS COMMUNIS, L. A crude soft soap, made of fish oil and potash; but the following mixture is usually sold for it:—soft soap, 7 lbs.; train-oil, 1 lb.; water, 7 gall.; boil to a proper consistence, adding heavy black or powdered charcoal, q. s. to colour. *Used* by farriers.

SOAPS (Medicated). A few only of these deserve notice here:—

Soap, Antimonial. *Syn.* SAPO ANTIMONIALIS, SAPO STILATUS, L. *Prep.* (Hamb. Cod. 1845.) Golden sulphuret of antimony, 2 drs.; solution of caustic potassa, 6 drs. (or q. s.); dissolve and triturate the solution with medicated (Castile) soap (in powder), $1\frac{1}{2}$ oz., until the mass assumes a pillular consistence. It should be of a grayish-white colour.

Soap, Chlorinated. *Syn.* SAPO CALCIS CHLORINATE, L.; SAVON ANTISYPHILITIQUE, Fr. *Prep.* From Castile soap (in powder), 11 oz.; chloride of lime (dry and good), 1 oz.; mix, beat them to a mass with rectified spirit, q. s.; (holding in solution) oil of verbena or of ginger grass, $\frac{1}{4}$ oz.; lastly, form the mass into flat tablets, and wrap these in thin sheet gutta percha. A most excellent detergent and stimulant soap in various affections, admirably adapted for hospital use, and for removing

stains from the skin and rendering it white. It is the most powerful known agent against infection from contagious diseases communicable by contact.

Soap, Cro'ton. *Syn.* SAPO CROTONIS, L. *Prep.* From croton oil and liquor of potassa, equal parts; triturated together in a warm mortar until they combine. Cathartic.—*Dose.* 1 to 3 grs.

Soap of Gua'iacum. *Syn.* SAPO GUAIACI, SAPO GUAIACINUS, L. *Prep.* (Ph. Bor.) Liquor of potassa, 1 oz.; water, 2 oz.; mix in a porcelain capsule, apply heat, and gradually add of resin of guaiacum (in powder), 6 drs., or as much as it will dissolve; next decant or filter, and evaporate to a pikular consistence.—*Dose.* 10 to 30 grs.; in chronic rheumatism, various skin diseases, &c.

Soap, I'odine. *Syn.* SAPO IODURATUS, L. *Prep.* From Castile soap (sliced), 1 lb.; iodide of potassium, 1 oz.; (dissolved in) water, 3 fl. oz.; melt them together in a glass or porcelain vessel, over a water bath. Excellent in various skin diseases; also as a common soap for scrofulous subjects.

Soap of Jal'ap. See page 663.

Soap, Macquer's Acid. *Syn.* SAPO VITRIOLICUS, L. *Prep.* From Castile soap, 4 oz., softened by heat and a little water, and then continually triturated in a mortar with oil of vitriol (added drop by drop). Detergent. *Used* where alkalis would be prejudicial.

Soap, Mercur'rial. *Syn.* SAPO MERCURIALIS, L. *Prep.* 1. (SAPO SUBLIMATIS CORROSIVI.) From Castile soap (in powder) 4 oz.; corrosive sublimate, 1 dr.; (dissolved in) rectified spirit, 1 fl. oz.; beaten to a uniform mass in a porcelain or wedgwood-ware mortar.

2. (SAPO HYDRARGYRI PRECIPITATI RUBRI.—Sir H. Marsh.) From white Windsor soap, 2 oz.; nitric oxide of mercury (levigated), 1 dr.; otto of roses, 6 or 8 drops; (dissolved in) rectified spirit, 1 to 2 fl. drs.; as the last. Both the above are employed as stimulant detergents and repellants, in various skin diseases; also as SAVON ANTISYPHILITIQUE.

Soap, Sul'phuretted. *Syn.* SAPO SULPHURIS, SAPO SULPHURATUS, L. *Prep.* (Sir H. Marsh.) From white soap, 2 oz.; sublimed sulphur, ½ oz.; beaten to a smooth paste in a marble mortar with 1 or 2 fl. drs. of rectified spirit strongly coloured with alkanet root, and holding in solution otto of roses, 10 or 12 drops. In itch and various other cutaneous diseases.

Soap, Tar. *Syn.* SAPO PICIS LIQUIDÆ, SAPO PICETIS, L. *Prep.* From tar, 1 part; liquor of potassa and soap (in shavings), of each, 2 parts; beat them together until they unite. Stimulant. *Used* in psoriasis, lepra, &c.

Soap, Tur'pentine. *Syn.* STARKEY'S SOAP; SAPO TEREBINTHINE, S. TEREBINTHINATUS, L.; SAVON Térébenthine, Fr. *Prep.* (P. Cod.) Subcarbonate of potash, oil of turpentine, and Venice turpentine, equal parts; triturate them together, in a warm mortar, with little water, until they combine; put the pro-

duct into paper moulds, and in a few days slice it, and preserve it in a well-stopped bottle.

SOAPS (Toilet). Of Toilet soaps there are two principal varieties:—

1. (HARD.) The basis of these is, generally, a mixture of suet, 9 parts, and olive oil, 1 part, saponified by caustic soda; the product is variously scented and coloured. They are also made of white tallow, olive, almond, and palm-oil soaps, either alone or combined in various proportions, and scented.

2. (SOFT.) The basis of these is a soap made of hog's lard and potash, variously scented and coloured.

On the small scale, the perfume is generally added to the soap melted in a bright copper pan by the heat of a water bath; on the large scale, it is mixed with the liquid soap, at the soap-maker's, before the latter is poured into the frames.

The following are examples of a few of the leading toilet soaps:—

Soap, Bitter-al'mond. *Syn.* SAVON D'AMANDE, Fr. *Prep.* From white tallow soap, 56 lbs.; essential oil of almonds, ½ lb.; as before.

Savon au Bouquet. [Fr.] *Prep.* From tallow soap, 30 lbs.; olive-oil soap, 10 lbs.; essence of bergamot, 4 oz.; oils of cloves, sassafras, and thyme, of each, 1 oz.; pure neroli, ½ oz.; brown ochre (finely powdered), ½ lb.; mixed as the last.

Soap, Cin'namon. *Prep.* From tallow soap, 14 lbs.; palm-oil soap, 7 lbs.; oil of cinnamon (cassia), 3 oz.; oil of sassafras and essence of bergamot, of each, ½ oz.; levigated yellow ochre, ½ lb.

Soap, Floating. *Prep.* From good oil soap, 14 lbs.; water, 3 pints; melted together by the heat of a steam or water bath, and assiduously beaten until the mixture has at least doubled its volume, when it must be put into the frames, cooled, and cut into pieces. Any scent may be added.

Soap, Hon'ey. *Prep.* 1. From palm-oil soap and olive-oil soap, of each, 1 part; curd soap, 3 parts; melted together and scented with the oil of verberna, rose-geranium, or ginger-grass.

2. From the finest bright-coloured yellow soap, scented with the oils of ginger-grass and bergamot.

Soap, Musk. As CINNAMON SOAP, but with essence of musk, supported with a little essence of bergamot and oil of cloves, as perfume, and burnt sugar, to colour.

Soap, Naples. From olive oil and potash.

Soap, Orange-flower. As SAVON À LA ROSE, with oil of neroli or essence de petit grain, supported with a little of the essences of ambergris and Portugal, for perfume.

Soap, Palm-oil. *Syn.* VIOLET SOAP. Made of palm oil and caustic soda lye. It has a pleasant odour of violets and a lively colour.

Soap, Pearl. *Syn.* ALMOND CREAM; CRÈME

See also SAVONNETTES.

D'AMANDES, Fr. *Prep.* From a soap made of lard and caustic potash lye; when quite cold, it is beaten in small portions at a time in a marble mortar, until it unites to form a homogeneous mass, or 'pearls,' as it is called; essence of bitter almonds, q. s., to perfume, being added during the pounding.

Savon à la Rose. [Fr.] *Prep.* From a mixture of olive-oil soap, 36 lbs.; best tallow soap, 24 lbs.; (both new and in shavings;) water, 1 quart; melted in a covered bright copper pan, by the heat of a water bath, then coloured with vermilion (finely levigated), 2½ oz.; and, after the mixture has cooled a little, scented with otto of roses, 3 oz.; essence of bergamot, 2½ oz.; oils of cloves and cinnamon, of each, 1 oz.

Soap, Sha'ving. See PASTE (Shaving).

Soap, Transparent. *Prep.* From perfectly dry almond, tallow, or soft soap, reduced to shavings, and dissolved, in a closed vessel or still, in an equal weight of rectified spirit, the clear portion, after a few hours' repose, being poured into moulds or frames; after a few weeks' exposure to a dry atmosphere, the pieces are 'trimmed up' and stamped, as desired. It may be scented and coloured, at will, by adding the ingredients to it while in the soft state. A rose colour is given by tincture of archil; and yellow, by tincture of turmeric or annotta. It does not lather well.

Soap, Windsor. *Syn.* SAPO VINDESORÆ, S. VINDESORIENSIS, L. *Prep.* 1. (WHITE; S. V. ALBUS.) The best 'English' is made of a mixture of olive oil, 1 part, and ox tallow or suet, 9 parts, saponified by caustic soda. 'French Windsor-soap' is made of hog's lard, with the addition of a little palm oil. That of the shops is merely ordinary curd soap, scented with oil of caraway, supported with a little oil of bergamot, lavender, or origanum. To the finer qualities a little of the essences of musk and ambergris is occasionally added. 1½ lb. of the mixed scents is the common proportion per cwt.

2. (BROWN; S. V. FUSCUS.) This merely differs from the last in being coloured with burnt sugar, or (less frequently) with umber. Originally, it was the white variety, that had become mellow and brown with age.

SODA. See SODIUM.

SODIUM. *Na.* *Syn.* Natrium. The metallic base of soda. It was first obtained by Sir H. Davy, in 1807, by means of a powerful galvanic battery; but it may be more conveniently and cheaply procured, in quantity, by the method described under POTASSIUM. The process, when well conducted, is, however, much easier and more certain than that for the last-named metal.

Prep. The anhydrous carbonate of sodium, 6 parts, is dissolved in a little water, and the solution mixed with charcoal in fine powder, 2 parts, and charcoal in small lumps, 1 part; the whole is then evaporated to dryness, transferred to an iron

retort, and treated in the manner described page 961.

Obs. Very important improvements have been made in the manufacture of this metal. Deville, consisting partly in the simplification of the receiver, and partly in the addition of carbonate of calcium to the mixture, which addition appears to facilitate the reduction of the sodium in a most remarkable manner.

Prop., &c. Sodium is a soft silver-white metal, scarcely solid at common temperature; fuses at 194° Fahr., and volatilises at a high heat; it oxidises very rapidly in the air; when placed on the surface of cold water, it decomposes that liquid with great violence, generally without flame, in which it differs from potassium; on hot water it burns with bright yellow flame—in both cases a solution of pure soda being formed. Sp. gr. .972; is more malleable than any other metal, and may be easily reduced into very thin leaves (Under its other properties resemble those of potassium, but are of a feebler character. With oxygen it forms two oxides; with chlorine chloride (common salt); and—with bromine, iodine, fluorine, &c., bromide, iodide, fluoride, &c., all of which may be obtained by simple processes to the respective compounds of potassium, which, for the most part, it resembles.

Uses. Until recently, sodium has been regarded as a mere mechanical or philosophical curiosity; it has now, however, become of great practical importance, from being employed in the manufacture of the metals aluminium, magnesium, &c.

Tests. Sodium salts are recognised by their solubility in water, and by their giving a precipitate with none of the ordinary reagents. They give a rich yellow colour to the colourless Bunsen or the pale blue blowpipe flame. They can, to a certain extent, be also distinguished from potassium salts by the carbonate being an easily crystallisable salt, effervescent in dry air; the carbonate of potassium being crystallised with difficulty, and deliquescent. Platinum chloride does not give a precipitate with sodium chloride; neither does picric acid, perchlorate of ammonium, nor tartaric acid.

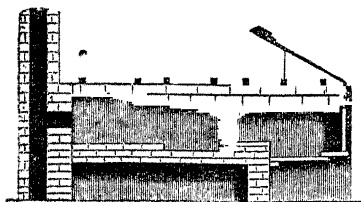

Sodium, Acetate of. $\text{NaC}_2\text{H}_3\text{O}_2$. *Syn.* ACETATE OF SODA; SODÆ ACETAS (B. P., Ph. D.). Prepared from carbonate of sodium and acetic acid, the corresponding potassium salt; but the resulting solution is evaporated to a pellicle, and then allowed to crystallise. Its crystals are striated oblique rhombic prisms; it effloresces slightly in the air, and is soluble in 4 parts of water at 60° Fahr. *Diuretic.*—*Dose.* 20 to 40 grs.

Sodium, Arseniates of. These salts are of the same nature and their properties and doses are the same as the corresponding potassium salts.

Sodium, Carbonate of. $\text{Na}_2\text{CO}_3 \cdot 10\text{Aq}$. CARBONATE OF SODA, MONO-CARBONATE OF SODA, SUBCARBONATE OF SODA, SALT OF SODA, SODÆ CARBONAS (B. P., Ph. L. E. & D.). The carbonate of sodium of commerce (w.

ING SODA) was formerly prepared from the ashes of seaweed, and other marine vegetables, in a somewhat similar manner to that by which carbonate of potassium is obtained; but it is now usually obtained from chloride of sodium, by the action of heat, sulphuric acid, and carbonaceous matter.

Prep. (From common salt or sulphate of sodium.) The latter is generally obtained by decomposing the former with sulphuric acid, the evolved gas being passed into water, or through flues filled with coke, over which a very small stream of cold water constantly flows, by which it is condensed, and forms 'LIQUID HYDROCHLORIC ACID,' a substance afterwards consumed, in large quantities, in the manufacture of chloride of lime, and for other purposes. The sulphate of sodium, obtained from this or any other source, is well mixed with an equal weight of chalk or lime-

Scotch Soda Furnace.

stone, and about half its weight of small coal, each being previously ground to powder, and the mixture is exposed to a strong heat in a 'reverberatory furnace' (see *engr.*) until the decomposition of the sulphate is complete, the mass during the calcination being frequently stirred about with a long iron rod; the semi-liquid is now raked into an iron trough, where it is allowed to cool, whilst the furnace is recharged with fresh materials. The crude dark-gray product, thus obtained, is known as 'ball alkali,' or 'British barilla,' and usually contains about 22 or 23% of pure hydrate of sodium. This is now lixiviated with tepid water, and the solution, after defecation, evaporated to dryness; the residuum is mixed with a certain quantity of sawdust, coal-dust, or charcoal, and roasted in a reverberatory furnace, at a heat not exceeding 700° Fahr., until all the sulphur is expelled. The product is the 'soda-ash,' 'soda salt,' or 'British alkali,' of commerce, and contains about 50% of pure sodium, partly in the state of carbonate, and partly as hydrate, the remainder, being chiefly sulphate of sodium and common salt. When this is purified by solution in water, defecation, evaporation, and crystallisation, it furnishes commercial crystallised carbonate of soda. When this last is redissolved, and the filtered solution is carefully crystallised, it constitutes the ordinary carbonate of sodium used in pharmacy and medicine.

When it is required anhydrous (SODÆ CARBONAS EXSICCATA, B. P., Ph. L.; SODÆ CARBONAS SICCATUM, Ph. E. & D.), the crystallised carbonate is heated to redness, and, when cold, powdered.

Prop., &c. Carbonate of sodium forms large, transparent, oblique rhombic prisms, which, as ordinarily met with, and of the formulae $\text{Na}_2\text{CO}_3 \cdot 10\text{Aq}$; but by particular management may be had with fifteen, nine, seven, or sometimes with only one molecule of water of crystallisation (Fownes); it is soluble in twice its weight of water at 60°, and less than an equal weight at 212° Fahr. As a medicine, it is deobstruent and antacid, and is given in doses of 10 to 30 grs. It is also, occasionally, used to make effervescing draughts. When taken in an overdose, it is poisonous. The antidotes are the same as for carbonate of potassium. The crude carbonate is largely employed in the manufacture of soap, glass, &c.

53 grs. of the dried carbonate are equal to 143 of the crystallised salt. The medicinal properties of both are similar. It has, however, the disadvantage of being difficultly soluble in water.

The ordinary carbonate of sodium generally contains either sulphates or chlorides, or both; and these may be detected as under CARBONATE OF POTASSIUM. "When supersaturated with nitric acid, it precipitates only slightly or not at all, chloride of barium or nitrate of silver; and 143 grs. require at least 960 grain-measures of solution of oxalic acid" (B. P.). At a high temperature, 100 grs. lose 62.5 grs. of water.

Sodium, Sesquicarbonate of, $\text{Na}_2\text{H}_3(\text{CO}_3)_3$. A salt found native on the banks of the soda lakes of Sotrena, in Africa, whence it is exported as "Trona."

Sodium, Bicarbonate of, NaHCO_3 . *Syn.* SESQUICARBONATE OF SODA, SODÆ BICARBONAS (B. P., Ph. L. E. & D.). This salt can be prepared in exactly the same manner as the corresponding salt of potassium. Another method is as follows:—Take of crystallised carbonate of sodium, 1 part; dried carbonate of sodium, 2 parts; (both in powder;) triturate them well together, and surround them with an atmosphere of carbonic acid gas, under pressure; let the action go on until no more gas is absorbed, which will generally occupy 10 to 14 hours, according to the pressure employed, then remove the salt, and dry it at a heat not above 120° Fahr.

Prop., &c. A crystalline white powder; it is soluble in 10 parts of water at 60° Fahr., but it cannot be dissolved in even warm water without partial decomposition; it is more pleasant tasted and more feebly alkaline than the carbonate of the same base. When absolutely pure, it does not darken turmeric paper, or only very slightly. The dose is from 10 to 40 grains, as an antacid and absorbent. It is much employed in the preparation of effervescing

Fahr., but at a higher temperature its solubility rapidly lessens; insoluble in alcohol; fuses when heated. It is seldom wilfully adulterated. When pure, the solution is neutral to test paper; nitrate of silver throws down scarcely anything from a dilute solution; nitrate of baryta more, which is not dissolved by nitric acid. It loses 55.5% of its weight by a strong heat.

Uses. It is purgative, but, being extremely bitter-tasted, is now less frequently used than formerly. Its nauseous flavour is said to be covered by lemon juice.—*Dose.* $\frac{1}{2}$ to 1 oz. The dried salt (SODÆ SULPHAS EXSICCATA) is twice as strong. LYMINGTON GLAUBER'S SALT is a mixture of the sulphates of soda and potassa obtained from the mother-liquor of sea-salt.

Sodium, Sulphide of. *Prep.* (P. Cod.) Saturate a solution of caustic soda (sp. gr. 1.200) with sulphuretted hydrogen, closely cover up the vessel, and set it aside that crystals may form; drain, press them in bibulous paper, and at once preserve them in a well-closed bottle. *Used* to make mineral waters, and in certain skin diseases.

The anhydrous sulphides resembles closely and are prepared in the same manner as the potassium sulphides.

Sodium, Tartrate of, and Potassium. $\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{Aq.}$ *Syn.* TARTRATE OF POTASSA AND SODA, ROCHELLE SALT, SEIGNETTE'S S., TARTRISED SODA†; SODÆ TARTARATA (B. P.), SODÆ POTASSIO-TARTRAS (Ph. L.), SODÆ ET POTASSÆ TARTRAS (Ph. E. & D.), SODA TARTRIZATA†, L. *Prep.* (Ph. L. 1836.) Take of carbonate of sodium, 12 oz.; boiling water, 2 quarts; dissolve, and add, gradually, of powdered bitartrate of potassium, 16 oz. (or q. s.); strain, evaporate to a pellicle, and set it aside to crystallise; dry the resulting crystals, and evaporate the mother-liquor that it may yield more of them. The formulæ of the other Colleges are nearly similar.

Prop., &c. Large, transparent, hard, right rhombic prisms, often occurring in halves; slightly efflorescent; soluble in 5 parts of water at 60° Fahr. Its "solution neither changes the colour of litmus nor of turmeric. On the addition of sulphuric acid, bitartrate of potassium is thrown down; on adding either nitrate of silver or chloride of barium nothing is thrown down, or only what is redissolved by the addition of water." (Ph. L.) By heat † yields a mixture of the pure carbonates of potassium and sodium.

Potassio-tartrate of sodium is a mild and cooling laxative.—*Dose.* $\frac{1}{4}$ to 1 oz., largely diluted with water. It forms the basis of the popular aperient called SEIDLITZ POWDERS.

Sodium, Valerianate of. $\text{NaC}_4\text{H}_5\text{O}_9$. *Syn.* SODÆ VALERIANAS (Ph. D.), L. *Prep.* (Ph. D.) Dilute oil of vitriol, 6½ fl. oz., with water, $\frac{1}{2}$ pint; then dissolve of powdered bichromate of potassium, 9 oz., with the aid of heat, in water, 3½ pints; when both solutions have

cooled, put them into a matrass, and having added of fusel oil (alcohol amylicum—Ph. D.), 4 fl. oz., shake them together repeatedly until the temperature, which first rises to 150°, has fallen to 80° or 90° Fahr.; a condenser being connected, next apply heat so as to distil over about 4 pints of liquid; saturate this exactly with a pint, or q. s., of solution of caustic soda, separate the liquid from the oil which floats upon the surface, and evaporate it until the residual salt is partially liquefied; the heat being now withdrawn, and the salt concreted, this last, whilst still warm, is to be divided into fragments, and preserved in well-stopped bottles.

Obs. This salt is intended to be used in the preparation of the VALERIANATES OF IRON, QUININE, and ZINC.

SOILS. These are classified by agriculturists according to their chief ingredients; as loamy, clayey, sandy, chalky, and peaty soils. Of these the first is the best for most purposes, but the others may be improved by the addition of the mineral constituents of which they are deficient. Sand and lime or chalk are the proper additions to clayey soils, and clay, gypsum, or loam, to sandy and gravelly ones. Clayey soils are expensive to bring into a fertile state; but when this is once effected, and they are well manured, they yield immense crops of wheat, oats, beans, clover, and most fruits and flowers of the rosaceous kinds.

The fertilisation of soils is suggested partly by chemical analysis, practical experience, and geological observations. In cases where a barren soil is examined with a view to its improvement, it is, "when possible, compared with an extremely fertile soil in the same neighbourhood, and in a similar situation; the difference given by their analyses indicates the nature of the manure required, and the most judicious methods of cultivation; and thus a plan of improvement is suggested, founded upon scientific principles.

The analysis of soils may be briefly and generally described as follows:—

1. The general character of the soil, as loamy, sandy, stoney, rather stoney, &c., being noted, 3 or 4 lbs. of it, fairly selected as an average specimen, may be taken during a period of ordinary dry weather. From this, after crushing or bruising the lumps with a piece of wood, all stones of a larger size than that of a filbert may be picked out, and their proportion to the whole quantity duly registered.

2. 1000 grs. of the remainder may be next dried by the heat of boiling water, until the mass ceases to lose weight; and, afterwards, exposed to a moist atmosphere for some time. The loss of weight in the first case, and the increase of weight in the second, indicate the absorbent powers of the soil.

3. The matter from No. 2, freed from siliceous stones by gartling, may be gradually heated to dull redness in a shallow open vessel,

avoiding waste from decrepitation, &c. The loss of weight, divided by 10, gives the percentage quantity of vegetable or organic matter present (nearly).

4. Another 1000 grs. (see No. 1) may be next washed with successive portions of cold water as long as anything is removed. The residuum, after being dried, indicates the proportion of sand and gravel (nearly).

5. Another portion of the soil (100, 200, or more grs., according to its character) is tested in the manner described under CARBONATE and ALKALIMETRY. The loss of weight in carbonic acid indicates the quantity of carbonate of lime present in the sample examined; 22 grs. of the former being equal to 50 grs. of the latter.

6. Another like portion of the soil may be gently boiled for 4 or 5 hours, along with dilute hydrochloric acid, in a flask furnished with a long glass tube passing through the cork, to prevent loss (see ETHER); after that time the whole must be thrown upon a filter, and what refuses to pass through (silica) washed with distilled water, dried, ignited, and weighed.

7. The filtrate and washings from No. 6 are next successively treated for alumina (pure clay), lime, phosphate of lime, phosphoric acid, oxide of iron, alkalies (potassa or soda), ammonia (both ready formed and latent), &c. &c., in the manner noticed under GLASS, GUANO, and the names of the respective substances referred to. See AGRICULTURE, MANURES, &c.

SOLANINE. *Syn.* SOLANIA, SOLANINA, L. A peculiar basic substance, obtained from the leaves and stem of *Solanum Dulcamara*, or *bitter-sweet*, and other species of the *Solanaceae*.

SOLDERING. The union of metallic surfaces by means of a more fusible metal fluxed between them. The method of autogenous soldering, invented by M. De Richmont, is an exception to this definition. In all cases the surfaces must be perfectly clean, and in absolute contact, and the air must be excluded, to prevent oxidation. For this last purpose the brazier and silversmith use powdered borax made into a paste with water; the copper-smith, powdered sal ammoniac; and the tinsmith, powdered resin. Tin-foil applied between the joints of fine brass work, first wetted with a strong solution of sal ammoniac, makes an excellent juncture, care being taken to avoid too much heat. See SOLUTION (Soldering), and *below*.

SOLDERS. *Prep.* 1. (For copper, iron, and dark brass.) From copper and zinc, equal parts; melted together. For pale brass more zinc must be used.

2. (Fine solder.) From tin, 2 parts; lead, 1 part. Melts at 350° Fahr. Used to tin and solder copper, tin plates, &c.

3. (For German silver.) From German silver, 5 parts; zinc, 4 parts; melted together,

run into thin flakes, and then powdered. Also as No. 7.

4. (Glazier's.) From lead, 3 parts; tin, 1 part. Melts at 500° Fahr.

5. (For gold.) Gold, 12 pennyweights; copper, 4 do.; silver, 2 do.

6. (For lead and zinc.) From lead, 2 parts; tin, 1 part.

7. (For pewter, Britannia metal, &c.) From tin, 10 parts; lead, 5 parts; bismuth, 1 to 3 parts.

8. (For silver.) From fine brass, 6 parts; silver, 5 parts; zinc, 2 parts.

9. (For tin plate.) From tin, 2 parts; lead, 1 part. The addition of bismuth, 1 part, renders it fit for pewter.

SOLE. The *Solea vulgaris*, a well-known fish. It is perhaps more frequently eaten than any other flat fish, and, when skilfully cooked, exceeds them all in delicacy, nutritiousness, and flavour.

SOLUTION. *Syn.* SOLUTIO, L. Under the head of solutions (SOLUTIONES), in pharmacy, are properly included only those liquids which consist of water, or an aqueous menstruum, in which has been dissolved an appropriate quantity of any soluble substance to impart to the liquor its peculiar properties. When spirit is the menstruum, the liquid receives the name of alcoholic solution, spirit, or tincture. In the B. P. and the Ph. L. & D. aqueous solutions are named LIQUORS (LIQUORES); whilst in the Ph. E., and in the old Pharmacopœias generally, they are termed WATERS (AQUE).

The following list embraces all the solutions of the British pharmacopœias, with a few others likely to be useful to the reader. Some other preparations to which the name has been given will be found under LIQUORS, TINCTURES, &c.

Solution of Acetate of Ammonia. *Syn.* LIQUOR OF ACETATE OF AMMONIA, WATER OF A. OF A., MINDERERUS' SPIRIT; AMMONIÆ ACETATIS LIQUOR (B. P.), LIQUOR AMMONIÆ ACETATIS (Ph. L. & D.), AMMONIÆ ACETATIS AQUA (Ph. E.), L. *Prep.* 1. (Ph. L.) From dilute acetic acid, 1 pint; exactly neutralised by sesquicarbonate of ammonia (in coarse powder), 9 drs., or q. s. Sp. gr. 1.022.

2. (Ph. E.) Distilled vinegar (preferably from French vinegar), sp. gr. 1.005, 24 fl. oz.; carbonate (sesquicarbonate) of ammonia, 1 oz., or q. s. Sp. gr. 1.011.

3. (Ph. D.) Sesquicarbonate of ammonia, 2½ oz.; dilute acetic acid, 3 pints. Sp. gr. 1.012.

4. (B. P.) Carbonate of ammonia, 3½, or sufficient; acetic acid (28 per cent.), 10; distilled water, 50. Dissolve the carbonate in the acid, and add the water.

Prop., &c. Free from colour and odour. It changes the colour neither of litmus nor turmeric. Sulphuretted hydrogen being dropped in, it is not discoloured, neither is anything thrown down on the addition of

chloride of barium. What is precipitated by nitrate of silver is soluble in water, but especially so in nitric acid. Potassa being added, it emits ammonia; and sulphuric acid being added, it gives off acetic vapours. The fluid being evaporated, what remains is completely destroyed by heat.

Uses, &c. Solution of acetate of ammonia is a very common and excellent febrifuge and diaphoretic, and, in large doses, aperient saline liquor. Taken warm, in bed, it generally proves a powerful sudorific; and as it operates without heat, it is much used in febrile and inflammatory disorders. Its action may likewise be determined to the kidneys, by walking about in the cold air.—*Dose.* 2 to 6 drs., twice or thrice daily, either by itself or along with other medicines. *Externally*, as a discutient and refrigerant lotion; and diluted (1 oz. to 9 oz. of water), as a collyrium in chronic ophthalmia. For this last purpose it must be free from excess of ammonia.

5. (Concentrated.) Saturate acetic acid, sp. gr. 1.038, $\frac{1}{2}$ gal., with carbonate of ammonia (in powder), 2 $\frac{1}{2}$ lbs., or q. s.; carefully avoiding excess.

Obs. This article is in great demand in the wholesale drug trade, under the name of 'concentrated liquor of acetate of ammonia' (LIQ. AMMON. ACET. CONC.). It is very convenient for dispensing. 1 fl. dr. added to 7 fl. drs. of water forms the LIQUOR AMMONIÆ ACETATIS of the Ph. L.

Solution of Acetate of Lead. See SOLUTION OF DIACETATE OF LEAD.

Solution of Acetate of Morphia. *Syn.* LIQUOR MORPHIÆ ACETATIS (B. P., Ph. L. & D.), L. *Prep.* 1 (Ph. L.) Acetate of morphia, 4 drs.; acetic acid, 15 drops; distilled water, 1 pint; proof spirit, $\frac{1}{2}$ pint; mix, and dissolve. 60 drops (minims) contain 1 gr. of acetate of morphia.—*Dose.* 5 to 15 or 20 drops.

2. (B. P.) Acetate of morphia, 4 grs.; diluted acetic acid, 8 minims; rectified spirit, 2 drs.; distilled water, 6 drs.; dissolve in the mixed liquids.—*Dose.* 10 to 60 minims.

3. (Ph. D.) Acetate of morphia, 82 grs.; rectified spirit, 5 fl. oz.; distilled water, 15 fl. oz. 120 drops (minims) contain 1 gr. of the acetate.—*Dose.* 10 to 45 or 50 drops, or similar to that of tincture of opium.

4. (Magendie.) Each fl. dr. contains 1 $\frac{1}{2}$ gr. of acetate (nearly).—*Dose.* 5 to 15 drops. Anodyne, hypnotic, and narcotic; in those cases in which opium is inadmissible. See MORPHIA.

Solution of Alum (Compound). *Syn.* BATE'S ALUM WATER; LIQUOR ALUMINIS COMPOSITUS (Ph. L.), AQUA ALUMINOSA COMPOSITA†, L. *Prep.* (Ph. L.) Alum and sulphate of zinc, of each, 1 oz.; boiling water, 3 pints; dissolve, and filter (if necessary). Detergent and astringent. Used as a lotion for old ulcers, chilblains, excoriations, &c.; and, largely diluted with water, as an eye-wash and injection.

Solution of Ammo'nia. See LIQUOR (AMMONIA).

Solution of Ammo'nio-ni'trate of Sil've *Syn.* HUME'S TEST; SOLUTIO ARGENTI AMMONIATI (Ph. E.), L. *Prep.* (Ph. E.) Nitrate of silver (pure crystallised), 44 grs.; distilled water, 1 fl. oz.; dissolve, and add ammonia water, gradually, until the precipitate, at first thrown down, is very nearly, but not entirely, redissolved. Used as a test for arsenic.

Solution of Ammo'nio-sul'phate of Cop'per *Syn.* LIQUOR CUPRI AMMONIO-SULPHATIS (Ph. L.), CUPRI AMMONIATI SOLUTIO (Ph. E.), C. A. AQUA, L. *Prep.* (Ph. L.) Ammonic sulphate of copper, 1 dr.; water, 1 pint; dissolve, and filter. Stimulant and detergent. Applied to indolent ulcers, and, when largely diluted, to remove specks on the cornea; also used as a test for arsenic.

Solution for Anatomical Preparations, &c. *Syn.* ANTISEPTIC SOLUTION. *Prep.* 1. Nearly saturate water with sulphurous acid, and add a little creasote.

2. Dissolve chloride of tin, 4 parts, in water 100 parts, to which 3% of hydrochloric acid has been added.

3. Dissolve corrosive sublimate, 1 part, and chloride of sodium, 3 parts, in water, 10 parts, to which 2% of hydrochloric acid has been added.

4. Mix liquor of ammonia (strong) with times its weight (each) of water and rectified spirit.

5. Sal ammoniac, 1 part; water, 10 or 1 parts. For muscular parts of animals.

6. Sulphate of zinc, 1 part; water, 15 to 1 parts. For muscles, integuments, and cerebral masses.

7. (Dr. Babington.) Wood naphtha, 1 part; water, 7 parts; or wood naphtha undiluted, as an injection.

8. (Sir W. Burnett.) Concentrated solution of chloride of zinc, 1 lb.; water, 1 gal. The substances are immersed in the solution for to 4 days, and then dried in the air.

9. (Gannal.) Alum and culinary salt, of each, $\frac{1}{2}$ lb.; nitre, $\frac{1}{2}$ lb.; water, 1 gal.

10. (Goadsby.)—*a.* From bay salt, 2 oz. alum, 1 oz.; bichloride of mercury, 1 gr. water, 1 pint. For ordinary purposes.

b. To the last add of bichloride of mercury, 1 gr.; water, 1 pint. For very tender tissue and where there is a tendency to mouldiness.

c. From bay salt, $\frac{1}{2}$ lb.; bichloride of mercury, 1 gr.; water, 1 pint. For subjects containing carbonate of lime.

d. From bay salt, $\frac{1}{2}$ lb.; arsenious acid 10 grs.; water, 1 pint; dissolve by heat. For old preparations.

e. To the last add of bichloride of mercury, 1 gr. As the last, when there is a tendency to the softening of parts; and, diluted, for mollusca. These solutions are approved of by Prof. Owen.

11. (M. Réboullet.) Nitre, 1 part; alum 2 parts; chloride of lime, 4 parts; water, 7

or 20 parts; to be afterwards diluted according to circumstances. For pathological specimens.

12. (Dr. Stapleton.) Alum, $2\frac{1}{2}$ oz.; nitre, 1 dr.; water, 1 quart. For pathological specimens.

13. (For FEATHERS—Beasley.) Strychnia, 16 grs.; rectified spirit, 1 pint.

Obs. These fluids are used for preserving ANATOMICAL PREPARATIONS, OBJECTS OF NATURAL HISTORY, &c., by immersing them therein, in close vessels; or, for temporary purposes, applying them by means of a brush or piece of rag. The presence of corrosive sublimate is apt to render animal substances very hard. See PUTREFACTION.

Solution, Antiseptic. See *above*.

Solution, Arsenical. *Syn.* MINERAL SOLUTION; SOLUTIO ARSENICALIS, SOLUTIO MINERALIS, L. *Prep.* 1. (Devergie.) As SOLUTION OF ARSENITE OF POTASSA, Ph. L., but of only 1-50th the strength, and flavoured with compound spirit of balm, and coloured to a deep rose with cochineal.

2. (Pearson.) Arsenate of soda, 4 grs.; water, 4 fl. oz.; dissolve.—*Dose.* 10 to 30 drops during the day. (See *below*.)

Solution of Arsenious Acid. See AGUE DROPS and ARSENIUS ACID.

Solution of Arsenite of Potassa. *Syn.* FOWLER'S MINERAL SOLUTION; LIQUOR POTASSÆ ARSENITIS (Ph. L.), LIQUOR ARSENICALIS (B. P., Ph. E. D. & U. S.), L. *Prep.* (B. P., Ph. L. & E.) Arsenious acid, coarsely powdered, and carbonate of potassa, of each, 80 grs.; distilled water, 1 pint; boil until dissolved, and add, to the cold solution, compound tincture of lavender, 5 fl. drs.; water, q. s. to make the whole exactly measure a pint. Tonic, antiperiodic, and alterative.—*Dose.* 4 or 5 drops, gradually and cautiously increased; in agues and various scaly skin diseases. It is preferably taken soon after a meal. See ARSENIUS ACID, &c.

Solution of Atropia. *Syn.* LIQUOR ATROPÆ (B. P.). *Prep.* Atropia, 4 grs.; rectified spirit, 1 dr.; dissolve and add water, 7 drs.; mix.—*Dose.* 1 minim.

Solution of Bismuth and Citrate of Ammonia. *Syn.* LIQUOR BISMUTHI ET AMMONIÆ CITRATIS (B. P.). Purified bismuth, $\frac{1}{2}$; nitric acid, 2; citric acid, 2; solution of ammonia, a sufficiency; mix the nitric acid with an ounce of distilled water, and add the bismuth in successive portions. When effervescence has ceased, apply for ten minutes a heat approaching that of ebullition, and decant the solution from any insoluble matter. Evaporate the solution until it is reduced to 2, then add the citric acid previously dissolved in 4 of distilled water, and afterwards the solution of ammonia in small quantities at a time, until the precipitate formed is redissolved, and the solution is neutral or slightly alkaline to test paper; dilute with distilled water to the volume of 20.—*Dose.* $\frac{1}{2}$ to 1 dr.

Solution, Brandish's. See SOLUTION OF POTASSA.

Solution, Burnett's. A solution of chloride of zinc. See SOLUTION FOR ANATOMICAL PREPARATIONS (*above*), also DISINFECTING COMPOUNDS.

Solution of Carbonate of Ammonia. *Syn.* SOLUTION OF SESQUICARBONATE OF AMMONIA, CARBONATE OF AMMONIA WATER; LIQUOR AMMONIÆ SESQUICARBONATIS (Ph. L.), AQUA AMMONIÆ CARBONATIS (Ph. E.). *Prep.* (Ph. L. & E.) Sesquicarbonate of ammonia, 4 oz.; distilled water, 1 pint; dissolve. Stimulant and antacid.—*Dose.* $\frac{1}{2}$ to 1 fl. dr., in water.

Solution of Carbonate of Magnesia. *Syn.* LIQUOR MAGNESIÆ CARBONATIS (B. P.). Prepared by impregnating water with carbonic anhydride under pressure, in which freshly precipitated carbonate of magnesia is suspended. *Dose.* 1 to 2 oz.

Solution of Carbonate of Potassa. *Syn.* OIL OF TARTAR†, WATER OF SUBCARBONATE OF POTASH†; LIQUOR POTASSÆ CARBONATIS (Ph. L. & D.), L. P. SUBCARBONATIS†, L. *Prep.* (Ph. L.) Carbonate of potassa, 20 oz. (10 oz.—Ph. D.); water, 1 pint; dissolve and filter (or decant). Sp. gr.—Ph. L., 1.473; Ph. D., 1.310. *Dose.* 10 drops to 1 dr., as an antacid, &c.

Solution of Carbonate of Soda. *Syn.* SUBCARBONATE OF SODA WATER†; SODÆ CARBONATIS LIQUOR (Ph. D.), L. *Prep.* (Ph. D.) Carbonate of soda (in crystals) $1\frac{1}{2}$ oz.; distilled water, 1 pint. Sp. gr. 1.026.—*Dose.* $\frac{1}{2}$ to $1\frac{1}{2}$ fl. oz., as an antacid; in heartburn, dyspepsia, &c.

Solution of Chloride of Antimony. *Syn.* ANTIMONII CHLORIDI LIQUOR (B. P.). *Prep.* Dissolve black sulphide of antimony in boiling hydrochloric acid. Used as an escharotic, and in the preparation of oxide of antimony.

Solution of Chloride of Arsenic. *Syn.* LIQUOR ARSENICI HYDROCHLORICI (B. P.), LIQUOR ARSENICI CHLORIDI (Ph. L.), L. *Prep.* 1. (Ph. L.) Arsenious acid (in coarse powder), $\frac{1}{2}$ dr.; hydrochloric acid, $1\frac{1}{2}$ fl. dr.; distilled water, 1 fl. oz.; boil until the solution of the arsenious acid is complete, and, when cold, add enough distilled water to make the whole exactly measure a pint.—*Dose.* 4 to 5 drops.

2. (B. P.) Arsenious acid, 80 grs.; hydrochloric acid, 2 drs.; distilled water, 20 oz.; boil the two acids with 4 oz. of the water until a solution is effected, then add sufficient distilled water to make up 20 oz.—*Dose.* 2 to 8 minims.

Solution of Chloride of Barium. *Syn.* SOLUTION OF MURIATE OF BARYT†; LIQUOR BARI CHLORIDI (Ph. L. & D.), SOLUTIO BARYTÆ MURIATIS (Ph. E.), L. *Prep.* (Ph. L. & E.) Dissolve chloride of barium, 1 dr. (1 oz.—Ph. D.), in water, 1 fl. oz. (8 oz. (Ph. D.)), and filter the solution. Sp. gr. (Ph. D.) 1.088.—*Dose.* 5 drops, gradually increased to 10 or 12, twice or thrice daily; in scrofula, scirrhus affections, and worms; ex-

ternally, largely diluted, as a lotion in scrofulous ophthalmia.

Solution of Chloride of Calcium. *Syn.* SOLUTION OF MURIATE OF LIME†; CALCII CHLORIDI LIQUOR (Ph. D.), CALCIS MURIATIS SOLUTIO (Ph. E.). *Prep.* 1. (Ph. L. 1836.) Fused chloride of calcium, 4 oz. (crystals, 8 oz.—Ph. E.); water, 12 fl. oz.; dissolve, and filter.

2. (Ph. D.) Fused chloride of calcium, 3 oz.; water, 12 oz. Sp. gr. 1.225.—*Dose.* 10 drops to 1 dr., or more; in scrofulous and glandular diseases, &c.

Solution of Chloride of Zinc. *Syn.* LIQUOR ZINCI CHLORIDI (B. P.). *Prep.* Granulated zinc, 8; hydrochloric acid, 22; solution of chlorine, q. s.; carbonate of zinc, $\frac{1}{2}$; distilled water, 10. Mix the acid and water in a porcelain dish, add the zinc, and apply a gentle heat to promote the action until gas is no longer evolved; boil for half an hour, supplying the water lost by evaporation, and allow the product to cool. Filter it into a bottle, and add solution of chlorine by degrees, with frequent agitation, until a brown sediment appears. Filter the liquid into a porcelain basin, and evaporate until it is reduced to the bulk of 20.

Solution of Chlorinated Lime. *Syn.* BLEACHING LIQUID, SOLUTION OF CHLORIDE OF LIME†, L. OF HYPOCHLORITE OF LIME; SOLUTIO CALCIS HYPOCHLORIS, S. CALCIS CHLORIDI, CALCIS CHLORINATE LIQUOR (Ph. D.), L. *Prep.* 1. (Ph. D.) Chlorinated lime ('chloride of lime'), $\frac{1}{2}$ lb.; water, $\frac{1}{2}$ gal.; triturate them together, then transfer the mixture to a stoppered bottle, and shake it repeatedly for the space of 3 hours; lastly, filter through calico, and preserve it in a well-stopped bottle.

2. Chloride of lime (dry and good, and rubbed to fine powder), 9 lbs.; tepid water, 6 galls.; mix in a stoneware bottle capable of holding 8 galls., agitate frequently for a day or two, and, after 2 or 3 days' repose, decant the clear portion, and keep it in well-corked bottles, in a cool situation. If filtered, it should be done as rapidly as possible, and only through coarsely powdered glass in a covered vessel.

Obs. The last is the usual strength sold in trade, under various attractive names, to give it importance. It is used as a disinfectant, bleacher, and fumigation; and, diluted with water, as a lotion, injection, or collyrium, in several diseases. See HYPOCHLORITE OF CALCIUM.

Solution of Chlorinated Potassa. *Syn.* SOLUTION OF CHLORIDE OF POTASH†, S. OF HYPOCHLORITE OF POTASSA, JAVELLE'S BLEACHING LIQUID; SOLUTIO POTASSÆ HYPOCHLORIS, LIQUOR POTASSÆ CHLORIDI, L. POTASSÆ CHLORINATE, L.; EAU DE JAVELLE, Fr. *Prep.* 1. Dissolve carbonate of potassa, 1 part, in water, 10 parts, and pass chlorine gas through the solution to saturation.

2. Chloride of lime (dry and good), 1 part;

water, 15 parts; agitate them together for an hour; next dissolve of carbonate of potassa, 2 oz., in water, $\frac{1}{2}$ pint; mix the two solutions, and after a time either decant or filter. *Uses*, &c., as the last.

Solution of Chlorinated Soda. *Syn.* SOLUTION OF CHLORIDE OF SODA†, S. OF HYPOCHLORITE OF SODA, LABARRAQUE'S DISINFECTING LIQUID; SOLUTIO SODÆ HYPOCHLORIS, HYPOCHLORIS SODICIUS AQUA SOLUTUS (P. Cod.), LIQUOR SODÆ CHLORINATE (Ph. L. & D.), L. *Prep.* 1. (Ph. L.), Carbonate of soda (in crystals), 1 lb.; water, 1 quart; dissolve, and pass through the solution the chlorine evolved from a mixture of common salt, 4 oz.; binocide of manganese, 3 oz.; sulphuric acid, $2\frac{1}{2}$ fl. oz. (4 oz.—Ph. L. 1836); diluted with water, 3 fl. oz.; placed in a retort, heat being applied to promote the action, and the gas being purified by passing through 5 fl. oz. of water before it enters the alkaline solution.

2. (Ph. D.) Chlorinated lime, $\frac{1}{2}$ lb., and water, 3 pints, are triturated together in a marble mortar, after which the mixture is transferred to a stoppered bottle, agitated frequently during three hours, and then filtered through calico; in the mean time carbonate of soda (cryst.), 7 oz., is dissolved in water, 1 pint; the two solutions are next mixed, and, after agitation for about 10 minutes, the whole is filtered as before. The filtrate is to be preserved in a well-stopped bottle.

Obs. This solution is used as an antiseptic, disinfectant, and bleaching liquid.—*Dose.* 20 to 30 drops, in any bland fluid, in scarlet fever, sore throat, &c; it is also made into a lotion, gargle, injection, and eye-water. Meat in a nearly putrid state, unfit for food, is immediately restored by washing or immersion in this liquid.

Solution of Chlorine. *Syn.* CHLORINE WATER; SOLUTIO CHLORINI, LIQUOR CHLORINI (Ph. L. & D.), CHLORINÆ AQUA (Ph. E.), L. *Prep.* 1. (Ph. L.) On binocide of manganese (in powder), 2 drs., placed in a retort, pour hydrochloric acid, 1 fl. oz., and pass the chlorine into distilled water, $\frac{1}{2}$ pint, until it ceases to be evolved.

2. (Ph. E.) Muriate of soda (common salt), 60 grs.; red oxide of lead, 350 grs.; triturate them together, and put them into 8 fl. oz. of distilled water, contained in a stoppered bottle; then add of sulphuric acid, 2 fl. drs.; and having replaced the stopper, agitate the whole, occasionally, until the oxide of lead turns white; lastly, after subsidence, pour off the clear liquid into another stoppered bottle.

3. (Ph. D.) Introduce into a gas bottle peroxide of manganese (in fine powder), $\frac{1}{2}$ oz.; add of hydrochloric acid, 3 fl. oz. (diluted with), water, 2 fl. oz.; apply a gentle heat, and cause the evolved gas to pass through water, 2 fl. oz., and then into a 3-pint bottle containing distilled water, 20 fl. oz., and whose mouth is

loosely plugged with tow; when the air has been entirely displaced by the chlorine, cork the bottle loosely, and shake it until the chlorine is absorbed; it should now be transferred to a pint stoppered bottle, and preserved in a dark and cool place.

Prop., &c. Irritant and acrid, but, when largely diluted, stimulant and antiseptic.—*Dose.* $\frac{1}{2}$ to 2 fl. dr., in $\frac{1}{2}$ pint of water, sweetened with a little sugar, in divided doses, during the day; in scarlatina, malignant sore throat, &c. On the large scale, liquid chlorine may be procured by passing the gas obtained by any of the methods named under CHLORINE, into water, until it will absorb no more.

Solution of Citrate of Ammonia. *Syn.* LIQUOR AMMONIÆ CITRATIS (B. P., Ph. L.), L. *Prep.* (Ph. L.) Dissolve citric acid, 3 oz., in distilled water, 1 pint; and to the solution add of sesquicarbonate of ammonia (in powder), $2\frac{1}{2}$ oz., or q. s. to exactly neutralise the liquor.—*Dose.* 2 to 6 fl. drs.

Solution of Citrate of Magnesia. *Syn.* SOLUTIO MAGNESIÆ CITRATIS, L. See page 729.

Solution of Citrate of Morphia. *Syn.* LIQUOR MORPHIÆ CITRATIS, SOLUTIO M. C., L. *Prep.* (Magendie.) Pure morphia, 13 grs.; citric acid, 8 or 10 grs.; water, 1 fl. oz.; tincture of cochineal, 2 fl. drs.—*Dose.* 3 to 12 drops.

Solution of Copal'ba. See SPECIFIC SOLUTION.

Solution of Corrosive Sublimate. *Syn.* SOLUTION OF CHLORIDE OF MERCURY; LIQUOR HYDRARGYRI BICHLORIDI† (Ph. L.). *Prep.* 1. (Ph. L.) Corrosive sublimate and sal ammoniac, of each, 10 grs.; water, 1 pint; dissolve.—*Dose.* As an alterative, 10 to 30 drops; as an antisyphilitic, $\frac{1}{2}$ to 2 fl. drs., in simple or sweetened water. It must not be allowed to touch anything metallic. It also forms a most useful lotion in various skin diseases.

2. See MERCURIAL LOTIONS.

Solution of Diacetate of Lead. See SOLUTION OF SUBACETATE OF LEAD.

Solution, Donovan's. See SOLUTION OF HYDRIDATE OF ARSENIC AND MERCURY (*below*).

Solution, Escharotic (Freyburg's). *Syn.* SOLUTIO ESCHAROTICA, L. *Prep.* From camphor, 30 grs.; corrosive sublimate, 60 to 100 grs.; rectified spirit, 1 fl. oz.; dissolve. In syphilitic vegetations, and specially condylomata. It is spread over the diseased surface, either at once or after the application of a ligature.

Solution of Flints. *Syn.* LIQUOR OF FLINTS; LIQUAMEN SILICUM, LIQUOR POTASSÆ SILICATIS, L. *Prep.* 1. Soluble glass dissolved in water.

2. (Batu.) Powdered quartz, 1 part; dry carbonate of potash, 2 parts (3 parts—Turner); triturate them together, fuse the mixture in a Hessian crucible, and allow the resulting glass to deliquesce by exposure in a damp situation.—*Dose.* 5 or 6 to 30 drops; in gouty concretions, stone, &c. "It resolves the stone, and opens obstructions." See SOLUBLE GLASS.

Solution, Gannal's. See page 1057.

Solution, Goadsby's. See page 1057.

Solution, Goulard's. See SOLUTION OF SUBACETATE OF LEAD.

Solution, Hahnemann's Prophylactic. *Syn.* LIQUOR BELLADONNÆ, SOLUTIO PROPHYLACTICA, L. *Prep.* From extract of belladonna (alcoholic), 3 grs.; distilled water, 6 fl. drs.; rectified spirit, 2 fl. drs.; dissolve. *Used* against scarlet fever.—*Dose.* 2 or 3 drops for a child under 12 months; and an additional drop for every year above that age to maturity.

Solution of Hydriodate of Arsenic and Mercury. *Syn.* DONOVAN'S SOLUTION; SOLUTIO ARSENICI ET HYDRARGYRI IODIDI, ARSENICI ET HYDRARGYRI HYDRIDATIS LIQUOR (Ph. D.), L. *Prep.* 1. (Donovan.) Triturate metallic arsenic, 6·08 grs., mercury, 15·88 grs., and iodine, 50 grs., with alcohol, 1 fl. dr., until dry; to this add, gradually, of distilled water, 8 fl. oz., and again well triturate; next put the whole into a flask, add of hydriodic acid, $\frac{1}{2}$ fl. dr., and boil for a few minutes; lastly, when cold, add distilled water, q. s. to make the whole measure exactly 8 fl. oz.

2. (Ph. D.) Pure arsenic (in fine powder), 6 grs.; pure mercury, 16 grs.; pure iodine, 50 $\frac{1}{2}$ grs.; alcohol, $\frac{1}{2}$ fl. dr.; triturate as before, add, gradually, of water, 8 fl. oz.; heat the mixture until it begins to boil, and, afterwards, make up the cold and filtered solution to exactly 8 fl. oz. 6 fl. dr.

3. (Wholesale.) From metallic arsenic, 61 grs.; iodine, 500 grs.; mercury, 154 grs.; rectified spirit, $1\frac{1}{2}$ fl. oz.; distilled water, 2 quarts; hydriodic acid, 5 fl. drs.; as No. 1; the product being made up with distilled water so as to measure exactly 4 pints, or 80 fl. oz., or to weigh 5 lbs. $1\frac{1}{2}$ oz. (av.), when cold.

Obs. Great care must be taken that the whole of the arsenic be dissolved, which can only be affected by the most careful trituration. Soubeiran recommends the employment of 1 part, each, of the respective iodides, with 98 parts of water, as furnishing a simpler and equally effective product, proportions which are almost exactly those employed by Mr. Donovan.—*Dose.* 10 to 30 drops, twice or thrice a day, preferable soon after a meal; in lepra, psoriasis, lupus, and several other scaly skin diseases. It is a most valuable medicine in these affections.

Solution of Hydrochlorate of Morphia. *Syn.* SOLUTION OF MURIATE OF MORPHIA; LIQUOR MORPHIÆ HYDROCHLORATIS (Ph. L.), SOLUTIO MORPHIÆ MURIATIS (Ph. E.), MORPHIÆ MURIATIS LIQUOR (Ph. D.), L. *Prep.* 1. (Ph. L.) Hydrochlorate of morphia, 4 drs.; proof spirit, $\frac{1}{2}$ pint; distilled water, 1 pint; dissolve by the aid of a gentle heat. 60 drops (minims) of this solution contain 1 gr. of hydrochlorate of morphia.—*Dose.* 5 to 15 or 20 drops.

2. (Ph. E. & D.) Muriate of morphia, 90 grs.; rectified spirit, 5 fl. oz.; distilled water,

15 fl. oz. 107 drops (minims) contain 1 gr. of the hydrochlorate.—*Dose.* 10 to 30 or 40 drops, or nearly as laudanum.

3. (Apothecaries' Hall.) Muriate of morphia, 16 grs.; rectified spirit, 1 fl. dr.; water, 1 fl. oz.; 30 drops (minims) contain 1 gr.—*Dose.* 3 to 10 drops. See SOLUTION OF ACETATE OF MORPHIA, &c.

Solution of Hypochlorite of Lime. Solution of chlorinated lime.

Solution of Iodide of Arsenic. *Syn.* LIQUOR ARSENICI PERIODIDI, L. *Prep.* (Wackenroder.) Each drachm contains $\frac{1}{2}$ gr. of teriodide of arsenic; equivalent to $\frac{1}{16}$ gr. of metallic arsenic, and $\frac{1}{16}$ gr. (nearly) of iodine.

Solution of Iodide of Mercury and Potassium. *Syn.* LIQUOR IODOHYDRARGYRATIS POTASSII IODIDI, L. *Prep.* (Dr. Channing.) Iodide of potassium, $3\frac{1}{2}$ grs.; biniodide of mercury, $4\frac{1}{2}$ grs.; distilled water, 1 fl. oz.; dissolve.—*Dose.* 2 to 5 or 6 drops, three times a day, much diluted; in dyspepsia, indurations, enlargement of the spleen, dropsy, &c.

Solution of Iodide of Potassium (Compound). *Syn.* IODURETTED WATER, COMPOUND SOLUTION OF IODINE; LIQUOR POTASSII IODIDI COMPOSITUS (Ph. L. & D.), LIQUOR IODINEI COMPOSITUS (Ph. E.), L. *Prep.* 1. (Ph. L. & D.) Iodide of potassium, 10 grs.; iodine, 5 grs.; water, 1 pint; dissolve.—*Dose.* 1 to 6 drs.; in the usual cases where iodine is employed.

2. (Ph. E.) Iodide of potassium, 1 oz.; iodine, 2 drs.; water, 16 fl. oz. This is 30 times as strong as the preceding.—*Dose.* 5 to 20 drops.

Solution of Iodine. See *above*.

Solution of Iron (Alkaline). *Syn.* LIQUOR FERRI ALKALINI, L. *Prep.* (Ph. L. 1824.) Iron filings, $2\frac{1}{2}$ drs.; nitric acid, 2 fl. oz.; water, 6 fl. oz.; dissolve, decant, gradually add of solution of carbonate of potash, 6 fl. oz., and in 6 hours decant the clear portion. This was intended as an imitation of Stahl's Tinctura Martis Alkalina. It is tonic, emmenagogue, &c.—*Dose.* 20 to 60 drops.

Solution, Javelle's. See page 1059.

Solution, Labarraque's. See page 1059.

Solution of Lime. *Syn.* LIME WATER; SOLUTIO CALCIS HYDRATIS, LIQUOR CALCIS (Ph. L. & D.), AQUA CALCIS (Ph. E.), L. *Prep.* (Ph. L.) Upon the lime, $\frac{1}{2}$ lb., first slaked (by sprinkling it) with a little of the water, pour the remainder of water, 12 pints, and shake them well together (for 5 minutes—Ph. D.); immediately cover the vessel, and set it aside for three hours; then keep the solution with the remaining lime (equally divided) in stoppered glass vessels, and, when it is to be used, decant the required portion from the clear solution (replacing it with more water, and agitating briskly, as before—Ph. E.).

Obs. Cold water dissolves more lime than hot water. 1 pint of water at 32° Fahr. dissolves $13\frac{1}{2}$ grs., at 60° it dissolves $11\frac{1}{2}$ grs., but at 212° only $6\frac{1}{2}$ grs. (Phillips.)

Uses, &c. Lime water is antacid, astringent,

antilithic, tonic, and vermifuge.—*Dose.* A wine-glassful, or more, 2 or 3 times a day, in milk or broth; in dyspepsia, diarrhoea, calculous affections, &c.; and, externally, as a detergent and discutient lotion.

Solution of Lime (Saccharated). *Syn.* LIQUOR CALCIS SACCHARATUS. *Prep.* Slaked lime, 1; refined sugar (in powder), 2; distilled water, 20; digest for some hours and strain.—*Dose.* 15 to 60 minims in milk.

Solution, Mackenzie's. *Prep.* From nitrate of silver, 20 grs., dissolved in distilled water, 1 fl. oz. Used to wash the throat and fauces, and to sponge the trachea, in affections of those parts.

Solution of Magnesia. *Syn.* AERATED MAGNESIA WATER, CARBONATED M. W., FLUID MAGNESIA, CONDENSED SOLUTION OF M., CONCENTRATED S. OF M.; LIQUOR MAGNESIÆ CARBONATIS, AQUA M. C., L.; EAU MAGNÉSIENNE, Fr. *Prep.* (Dinneford's.) Water and Howard's heavy carbonate of magnesia, in the proportion of $17\frac{1}{2}$ grs. of the latter to every fl. oz. of the former, are introduced into a cylindrical tinned copper vessel, and carbonic acid, generated by the action of sulphuric acid on whiting, is forced into it by steam power, for $5\frac{1}{2}$ hours, during the whole of which time the cylinder is kept in motion. Sir J. Murray's is similar. The Paris Codex orders recently precipitated carbonate of magnesia to be used while still moist. Antacid and laxative. See FLUID MAGNESIA.

Solution, Mineral. See SOLUTION OF ARSENITE OF POTASSA.

Solution of Morphia. See SOLUTIONS OF ACETATE, HYDROCHLORATE, and SULPHATE.

Solution of Nitrate of Mercury (Acid). *Syn.* LIQUOR HYDRARGYRI NITRATIS ACIDUS (B. P.). *Prep.* Mercury, 4; nitric acid, 5; distilled water, $1\frac{1}{2}$; mix the nitric acid with the water in a flask, and dissolve the mercury in the mixture without the application of heat. Boil gently for 15 minutes, cool, and preserve the solution in a stoppered bottle. Used alone, as a caustic; 1 to 2 minims to 1 oz. water, as a gargle; and 1 minim to 2-oz. water, as an injection in gonorrhoea.

Solution of Nitrate of Silver. *Syn.* LIQUOR ARGENTI NITRATIS (Ph. L.), SOLUTIO A. N. (Ph. E.), L. *Prep.* (P. L.) Nitrate of silver (cryst.), 1 dr. (40 grs.—Ph. E.); distilled water, 1 fl. oz. (1600 grs.—Ph. E.); dissolve. Used as an escharotic, &c. It should be kept from the light. See LOTION, SILVER, &c.

Solution of Opium (Sedative). See LIQUOR.

Solution of Oxysulphate of Iron. *Syn.* LIQUOR FERRI OXYSULPHATIS, L. *Prep.* From sulphate of iron (in powder) and nitric acid, of each, 3 drs.; triturated together for 15 minutes, and then dissolved in distilled water, $1\frac{1}{2}$ fl. oz.—*Dose.* 5 or 6 to 12 drops.

Solution of Permanganate of Potassa. *Syn.* LIQUOR POTASSÆ PERMANGANATIS (B. P.). *Prep.* Permanganate of potassa, 4 grs.; distilled water, 1 oz.; dissolve. Diluted with

40 parts of water, it is used as a gargle or as a cleansing wash for diseased surface.—*Dose*. 2 to 4 drs.

Solution of Perchloride of Iron. *Syn.* LIQUOR FERRI PERCHLORIDI (B. P.). *Prep.* Stronger solution of perchloride of iron (see *below*), 1; distilled water, 3.—*Dose*. 10 to 30 minims.

Solution of Perchloride of Iron (Stronger). *Syn.* LIQUOR FERRI PERCHLORIDI FORTIOR (B. P.). *Prep.* Iron wire, 2 oz.; hydrochloric acid, 12 oz.; nitric acid, 9 drs.; distilled water, 8 grs. Mix 8 of the hydrochloric acid with the water, and pour the mixture on the iron wire, applying a gentle heat, so that the whole of the metal may be dissolved; filter the solution, and add to it the remainder of the hydrochloric and nitric acids; heat the mixture briskly, until, on the sudden evolution of red fumes, the liquid becomes of an orange-brown colour, then evaporate by the heat of a water bath until it is reduced to 10 fl. oz. *Used* as an application to diphtheritic patches, for injecting naevi, as a powerful styptic, and in the preparation of SOLUTION OF PERCHLORIDE OF IRON. (See *above*.)

Solution of Ferric Nitrate of Iron. *Syn.* SOLUTION OF FERRESQUINITE OF IRON; FERRI PERNITRAS LIQUOR (Ph. D.), SOLUTIO FERRESQUINITRAS FERRI (Kerr), L. *Prep.* (Ph. D.). Take of pure nitric acid, 3 fl. oz.; water, 16 fl. oz.; mix, add fine iron wire, 1 oz.; dissolve, and to the clear solution add as much water as will make the whole measure 1½ pint. Sp. gr. 1·107.—*Dose*. 5 or 6 to 30 drops, or more; in passive hæmorrhages, mucous discharges, chronic diarrhoea with prostration, &c.

Solution of Persulphate of Iron. *Syn.* LIQUOR FERRI PERSULPHATIS. *Prep.* Sulphate of iron, 8; sulphuric acid, 2; nitric acid, 2; distilled water, 12. Add the sulphuric acid to 10 of the water, and dissolve the sulphate of iron in the mixture with the aid of heat. Mix the nitric acid with the remaining 2 of the water, and add the dilute acid to the solution of sulphate of iron. Concentrate the whole by boiling until, by the sudden evolution of ruddy vapours, the liquid ceases to be black, and acquires a red colour. A drop of the solution is now to be tested with ferricyanide of potassium, and if a blue precipitate be formed, a few additional drops of nitric acid should be added and the boiling renewed, in order that the whole may be converted into persulphate of iron. When the solution is cold, make up the quantity to 11 by the addition, if necessary, of distilled water. *Used* in making several preparations of iron; it is also a good styptic.

Solution of Perchloride of Mercury. *Syn.* LIQUOR HYDRARGYRI PERCHLORIDI (B. P.). *Prep.* Corrosive sublimate, 10 grs.; chloride of ammonium, 10 grs.; distilled water, 20 oz.; dissolve.—*Dose*. 30 to 120 minims.

Solution for Plate. *Syn.* PLATE LIQUOR; SOLUTIO PRO ARGENTO, L. *Prep.* From alum, cream of tartar, and common salt, of each, 1

oz.; water, ½ gal.; dissolve. *Used* to increase the lustre and whiteness of silver plate, the articles being boiled in it.

Solution of Potassa. *Syn.* SOLUTION OF HYDRATE OF POTASSA, LIQUOR OF POTASSA, POTASH WATER, CAUSTIC P. W.; LIQUOR POTASSÆ (B. P., Ph. L.), AQUA POTASSÆ (Ph. E.), POTASSÆ CAUSTICÆ LIQUOR (Ph. D.), AQUA KALI PURI†, LIXIVIVM SAPONARIUM†, AQUA KALI CAUSTICUM†, LIXIVIVM CAUSTICUM†, L. *Prep.* 1. (Ph. L.) Lime (recently burnt), 8 oz.; boiling distilled water, 1 gal.; sprinkle a little of the water on the lime in an earthen vessel, and, when it is slaked and fallen to powder, add of carbonate of potassa, 15 oz., dissolved in the remainder of the water; hung down, and shake frequently, until the mixture is cold, then allow the whole to settle, and decant the clear supernatant portion into perfectly clean and well-stoppered green-glass bottles. Sp. gr. 1·063. It contains 6·7½ of pure potassa.

2. (Ph. E.) Carbonate of potassa (dry), 4 oz.; quicklime, 2 oz.; water, 45 fl. oz.; boiling briskly for a few minutes after each addition of the milk of lime; to yield at least 35 fl. oz., by decantation, after 24 hours' repose in a deep, narrow, glass vessel. Sp. gr. 1·072.

3. (Ph. D.) Pure carbonate of potassa, 1 lb.; distilled water, 1 gal.; dissolve, heat the solution to the boiling-point in a clean iron vessel, gradually add to it of fresh quicklime, 10 oz., previous slaked with water, 7 fl. oz., and continue the ebullition for 10 minutes, with constant stirring; next allow it to cool out of contact with the air, and, when perfectly clear, decant it by means of a syphon, and bottle it as before. Sp. gr. 1·068.

4. (B. P.) Carbonate of potash, 2; slaked lime, 1½; distilled water, 20; dissolve the carbonate of potash in the water, and having heated the solution to the boiling-point in a clean iron vessel, gradually mix the slaked lime, and continue the ebullition for 10 minutes with constant stirring; decant the clear liquid.—*Dose*. 15 to 60 minims 3 times a day in beer, milk, or *Mistura Amygdala*.

5. (Wöhler.) Nitrate of potassa, 1 part, is mixed, in alternate layers, with clippings of sheet copper, 2 or 3 parts, and then heated to moderate redness for about ½ an hour in a copper or iron crucible; when cold, the potassa is washed out with distilled water, and the solution, after repose in a closed vessel, decanted as before. Not a trace of copper can be detected in the liquid. The clippings may be again used if mixed with a little fresh metallic copper.

6. (Wholesale.) From carbonate of potash (kali), 1 lb., and quicklime, ½ lb., to each gal. of water.

7. (BRANDISH'S ALKALINE SOLUTION; LIQUOR POTASSÆ BRANDISHII.) From American pearlshes, 6 lbs.; quicklime and wood-ashes (from the ash), of each, 2 lbs.; boiling water, 6 galls. (old meas.); to each gal. of the clear

product is added 12 or 15 drops of oil of juniper. This 'solution' is much asked for in trade. Ordinary liquor of potassa is generally sold for it.

Prep. "Nothing, or scarcely anything, is thrown down from this solution on the addition of lime water; and when it has been first saturated by nitric acid, no precipitate falls on the addition of carbonate of soda, chloride of barium, or nitrate of silver. What is thrown down by bichloride of platinum is yellowish." (Ph. L.)

Uses, &c. Liquor of potassa is antacid, diuretic, resolvent, and lithontriptic.—*Dose*, 10 to 30 or 40 drops, in any bland diluent (not acidulous); in heartburn, gout, calculi, indurations, scrofula, lepra, psoriasis, &c.

Obs. Quicklime fails to abstract the carbonic acid from the alkaline carbonates in solutions much stronger than those above referred to. Weaker solutions may, however, be easily concentrated by evaporation in iron vessels. See HYDRATE OF POTASSA, and *below*.

Solution of Potassa (Effervescing). Syn. LIQUOR POTASSÆ EFFERVESCENS (B. P.); EFFERVESCING POTASH WATER, SUPERCARBONATE OF POTASSA W.; AQUA POTASSÆ EFFERVESCENS (Ph. E.), A. P. SUPERCARBONATIS, L. *Prep.* (Ph. L. & E.) Bicarbonate of potash, 1 dr.; distilled water, 1 pint; dissolve, force in carbonic acid gas, in excess, and keep it in a well-stoppered bottle. Resembles soda water, but sits better on the stomach. It is almost specific in the early stages of scurvy.

Obs. An excellent substitute for this preparation is to pour a bottle of soda water into a tumbler containing 20 grs. of powdered bicarbonate of potash, and to drink it immediately.

Solution of Potassio-tartrate of Antimony. Syn. SOLUTIO ANTIMONII POTASSIO-TARTRATIS, ANTIMONII TARTARIZATI LIQUOR (Ph. D.), L. *Prep.* (Ph. D.) Tartarised antimony, 1 dr.; rectified spirit, 7 fl. oz.; distilled water, 1 pint; dissolve. Strength, doses, and uses, similar to those of antimonial wine (which see), than which it keeps better.

Solution, Prophylactic. See HAHNEMANN'S SOLUTION.

Solution of Sesquicarbonate of Ammonia. See SOLUTION OF CARBONATE OF AMMONIA.

Solution of Silicate of Potassa. See SOLUTION OF FLINTS.

Solution of Soda. Syn. SOLUTION OF HYDRATE OF SODA, LIQUOR OF SODA, CAUSTIC SODA WATER; LIQUOR SODÆ (B. P., Ph. L.), SODÆ CAUSTICÆ LIQUOR (Ph. D.), L. *Prep.* 1. (Ph. L.) Carbonate of soda (cryst.), 32 oz.; lime, 9 oz.; boiling distilled water, 1 gal.; proceed as for solution of potassa. "In 100 grs. are contained 1 gr. of (pure) soda." (Ph. L.) Sp. gr. 1.061.

2. (Ph. D.) Carbonate of soda (cryst.), 2 lbs.; fresh-burned lime, 10 oz.; water, 1 gal. 7 fl. oz.; as liquor of potassa. Sp. gr. 1.056.

3. (B. P.) Carbonate of soda, 7; slaked

lime, 3; distilled water, 40; dissolve the carbonate in the water, boil in a clean iron vessel, gradually mixing the lime, and stirring constantly for ten minutes; decant into a green glass bottle, with air-tight stopper. Sp. gr. 1.047.—*Dose*. $\frac{1}{2}$ to 1 dr.

Solution of Soda (Effervescing). Syn. SODA WATER; LIQUOR SODÆ EFFERVESCENS, AQUA S. E. (Ph. E.), A. S. SUPERCARBONATIS, SODÆ CARBONATIS AQUA ACIDULA, L. *Prep.* (Ph. E.) Bicarbonate of soda, 1 dr.; distilled water, 1 pint; dissolve, and force carbonic acid gas into the solution, under pressure. *Used* as an antacid and grateful stimulant, often proving gently laxative. The soda water of the shops cannot be substituted for this preparation, as, in opposition to its name, it is usually made without soda.

Solution of Sulphate of Atropia. Syn. LIQUOR ATROPIÆ SULPHATIS (B. P.). *Prep.* Sulphate of atropia, 4 grs.; distilled water, 1 oz.; dissolve.—*Dose*. 1 to 2 minims.

Solution, Soldering. Prep. Dissolve zinc in hydrochloric acid nearly to saturation, add 1-5th part of powdered sal ammoniac, and simmer for 5 minutes. *Used* to make solder flow easily and take well; applied with a feather. See SOLDERING.

Solution, Specific (Frank's). Syn. SPECIFIC SOLUTION OF COPAIBA; LIQUOR COPAIBÆ ALKALINA, L. *Prep.* Take of balsam of copaiba, 2 parts; liquor of potassa (Ph. L.), 3 parts; water, 7 parts; boil the mixture for 2 or 3 minutes, put it into a separator, and allow it to stand for 5 or 6 days; then draw it off from the bottom, avoiding the upper stratum of oil, and to the clear liquid add of sweet spirit of nitre (perfectly free from acid), 1 part; should it turn foul or milky, a very little liquor of potassa will usually brighten it; if not, place it in a clean separator, and let it stand, closely covered, for a few days, and then draw it off from the bottom as before, when it will be perfectly transparent, without filtering. Some persons add the sweet spirit of nitre whilst the solution is still warm, mix it in as rapidly as possible, and immediately cork or fasten up the vessel. This is a good way when the article is wanted in a hurry, but is objectionable from the loss of spirit thereby occasioned, and the danger, without care, of bursting the separator.

Obs. A receipt for this article, upon the authority of Battley, has been going the round of the pharmaceutical works for many years. It is as follows:—Take 12 oz. of balsam of copaiba, and 6 oz. of calcined magnesia; rub together, add a pint of proof spirit, filter, and then add $\frac{1}{2}$ oz. of sweet spirits of nitre." ("Gray's Supplement.") The product of this formula, utterly unlike 'Frank's Specific Solution,' is a colourless tincture, scarcely flavoured with copaiba, and holding very little of the active matter of the balsam in solution, owing to the compound formed with the magnesia being insoluble in spirit. Such is the

affinity of this earth for copaiba (copaibic acid), that it will even take it from caustic potassa. See COPAIBA, and its preparations.

Solution of Strychnia. *Syn.* LIQUOR STRYCHNIE (B. P.). *Prep.* Strychnia, in crystals, 4 grs.; dilute hydrochloric acid, 6 minims; rectified spirit, 2 drs.; distilled water, 6 drs.; mix the hydrochloric acid with 4 drs. of the water, and dissolve the strychnia in it by means of heat; then add the spirit and the remainder of the water.—*Dose.* 4 to 10 minims.

Solution of Subacetate of Lead. *Syn.* LIQUOR OF SUBACETATE OF LEAD, L. OF DIACETATE OF L., GOULARD'S EXTRACT; LIQUOR PLUMBI, L. PLUMBI DIACETATIS (Ph. L.), PLUMBI DIACETATIS SOLUTIO (Ph. E.), PLUMBI SUBACETATIS LIQUOR (Ph. D.), L. *Prep.* 1. (Ph. L.) Acetate of lead, 27 oz.; litharge, in fine powder, 16 oz.; water, 3 quarts; boil for $\frac{1}{2}$ an hour, constantly stirring, and then add enough distilled water to make the whole measure 3 quarts; lastly, filter, if required, and keep it in a closed vessel. The proportions ordered in the Ph. E. are similar. Sp. gr. 1.260.

2. (Ph. D.) Acetate of lead, 6 oz.; litharge, 4 oz.; distilled water, 1 quart; boil, &c., as before; to produce, 1 quart. Sp. gr. 1.066.

3. (Wholesale.) From finely powdered litharge, 32 lbs.; distilled vinegar, 32 galls.; boil in a perfectly bright copper pan for 2 hours, cool, add water to make up 32 galls., again simmer for 1 minute, cover up the vessel, and in an hour decant the clear portion. Common trade strength. (See *below*.)

Solution of Subacetate of Lead (Dilute). *Syn.* GOULARD, GOULARD'S LOTION, G.'S WATER; LIQUOR PLUMBI DIACETATIS DILUTUS (Ph. L.), PLUMBI SUBACETATIS LIQUOR COMPOSITUS (Ph. D.), L. *Prep.* 1. (Ph. L.) Liquor of diacetate of lead, $1\frac{1}{2}$ fl. dr.; proof spirit, 2 fl. drs.; distilled water, 1 pint; mix.

2. (Ph. D.) Solution of subacetate of lead and proof spirit, of each, 2 fl. oz.; distilled water, $\frac{1}{2}$ gal.; mix, filter, and preserve it in a well-stopped bottle.

Obs. Both the above preparations were formerly made with common vinegar, and hence were coloured, but those of the Pharm. are white. If wanted coloured, a little spirit colouring may be added. The stronger liquor is only used diluted; and the dilute solution is now seldom prepared by the wholesale druggist. The last (diluted solution) is employed as a sedative, refrigerant, and astringent wash, in various affections. Both are poisonous. For the antidotes, see LEAD.

Solution of Sulphate of Morphia. *Syn.* LIQUOR MORPHIE SULPHATIS, L. *Prep.* From sulphate of morphia, as the solution of the acetate or hydrochlorate. The uses, doses, &c., are the same.

Solution of Sulphate of Zinc (Compound). See COMPOUND SOLUTION OF ALUM.

Solution of Sulphuret of Potassium. *Syn.*

SOLUTION OF HYDROSULPHATE OF POTASSA SOLUTIO POTASSII SULPHURETI, LIQUOR POTASSÆ HYDROSULPHATIS, AQUA POTASSÆ SULPHURETI (Ph. D.), L. *Prep.* Take of washed sublimed sulphur, 1 part; water of caustic potassa, 11 parts; mix, boil for 10 minutes, filter, and keep the solution in well-closed bottles. Sp. gr. 1.117. The product is a mixture of hydrosulphate and hyposulphite of potassa.—*Dose.* 10 to 60 drops, diluted in water; and, externally, made into a lotion in it, and several other eruptive diseases.

SOLVENT. *Syn.* MENSTRUUM, L. The liquid in which any substance is dissolved. The substance dissolved is, occasionally, called the 'solvend.' (Kirwan.)

Solvent, Glazier's. *Syn.* GLAZIER'S PICKLE. From soft soap dissolved in thrice its weight of strong soaper's lye; or, from freshly slaked lime made into a thin paste or cream with twice its weight of pearlsh dissolved in a little water. Very caustic. *Used* to soften old putty, and to remove old paint.

SOOT. *Syn.* FULIGO. Wood soot was formerly official, and reputed vermifuge and antiseptic. The soot from pit-coal contains, besides empyreumatic matter, sulphate of ammonia; hence, it is valuable as a manure, when not too freely applied. It is also employed by gardeners to kill insects.

SOPORIFICS. Hypnotics (which see).

SOU'JEE. *Syn.* SOOJEE. A species of semolina. Semoletta (*semola rarita*) is a still smaller variety of pearly wheat, separated from the others by means of a sieve. 'Baster's soojee' is said to be a mixture of ordinary wheat flour and sugar.

SOUP KROUT. See SAUER-KROUT.

SOUP. A strong decoction of flesh, properly seasoned with salts, spices, &c., for the table. The different tastes of people require more or less of the flavour of spices, salt, garlic, butter, &c., which can, therefore, never be ordered by general rules. If the cook has not a good taste, and attention to that of his or her employers, not all the ingredients which nature and art can furnish will give an exquisite flavour to the dishes. The proper articles should be always at hand, and must be proportioned until the true zest be obtained. A variety of flavours may be given to different dishes served at the same time, or even to the same soup, by varying the condiments and spices. At a Parisian restaurant one cauldron is made to produce almost every imaginable variety of soup.

Soup, Portable. *Syn.* GLAZE. From skin of beef, or other like part; the soup being gently simmered until reduced to the consistency of a thin syrup, and then poured into small upright jelly-pots, with covers, or, upon flat dishes, to lie about $\frac{1}{4}$ inch deep. The latter, when set, is divided into pieces, which are dried. *Used* to make extemporaneous soup and glazes. A similar article, prepared on the

large scale, now generally forms part of every ship's stores.

SOUR'ING. See MALT LIQUORS and WINES.

SOY. Genuine soy is a species of thick black sauce, imported from China. *Prep.* Take of the seeds of *Soja hispida* (white haricots or kidney beans may be used for them), 1 gal.; boil them in water, q. s., until soft, add of bruised wheat, 1 gal., and keep the mixture in a warm place for 24 hours; then add of common salt, 1 gal.; water, 2 galls.; put the whole into a stone jar, and bung it up loosely for two or three months, shaking it very frequently during the whole time; lastly press out the liquor and bottle it; the residuum may be treated afresh with water and salt, for soy of an inferior quality.

Obs. The soy of the shops is, in nine cases out of ten, a spurious article made in this country, by simply saturating molasses or treacle with common salt. A better and a really wholesome imitation is made as follows:—Malt syrup, 1 gall. (or, 13½ lbs.); treacle, 5 lbs.; salt, 4½ lbs.; mushroom juice, 1 quart; mix, with a gentle heat, and stir until the union is complete; in a fortnight decant the clear portion.

SPANISH FLIES. See CANTHARIDES.

SPAR'ADRAP. *Syn.* SPARADRAPUM, L. Originally, a cerecloth; now, applied to spread plasters; as, SPARADRAPUM COMMUNE, common strapping or adhesive plaster; s. VESICATORIUM, blistering plaster or tissue, &c.

SPARTEINE. *Syn.* SPARTEINA, L. A volatile oily liquid, possessing basic properties, obtained from *Spartium scoparium*, or broom. It is highly poisonous, and resembles conine and nicotine in its general properties.

SPASMS. *Syn.* CRAMP; SPASMUS, L. An involuntary contraction of the muscles, generally of the extremities, accompanied with pain, more or less severe. Spasms are distinguished into clonic spasms or convulsions, in which the contractions and relaxations are alternate, as in epilepsy; and into tonic spasms, in which there is continued rigidity, as in locked-jaw. That form which commonly attacks the muscles of the legs and feet, especially after great exertion or exposure to cold, is commonly called cramp. The best treatment for this is immediately to stand upright, and to well rub the part with the hand. The application of strong stimulants, as spirits of ammonia, or of anodynes, as opiate liniments, has been recommended. When spasm or cramp occurs in the stomach, a teaspoonful of sal volatile in water, or a tablespoonful of good brandy, may be swallowed immediately. When cramp comes or during cold bathing, the limb should be thrown out as suddenly and violently as possible, which will generally remove it, care being also taken not to become hurried or frightened, as presence of mind is very essential to personal safety on such an occasion. A common cause of spasm is indigestion, and

the use of acescent liquors; these should, therefore, be avoided, and bitters and absorbents had recourse to. See ANTISPASMODICS, and the names of the principal spasmodic diseases.

SPEAR'MINT. See MINT.

SPECIES. (In pharmacy.) Mixtures of dried plants, or parts of plants, in a divided state, which, for convenience, are kept mixed for use. The dry ingredients of pills, conserves, electuaries, mixtures, &c., that do not keep well when made up, or which are in little demand, may be economically and conveniently preserved in this state. The word, thus applied, is obsolete out of the pharmaceutical laboratory.

Species, Anthelmintic. *Syn.* SPECIES ANTHELMINTICÆ, L. The dried flowering tops of tansy and wormwood, and the flowers of chamomile, equal parts; mix, and keep them in a close vessel. (P. Cod.)

Species, Aperitive. See DIURETIC SPECIES (*below*).

Species, Aromatic. *Syn.* AROMATIC POWDER; SPECIES AROMATICÆ, L. *Prep.* (Ph. Bor.) Leaves of balm and curled-leaf mint (*Mentha crispæ*), of each, 4 oz.; lavender flowers, 2 oz.; cloves, 1 oz.; dry them by a gentle heat, and then powder them.

Species, Astringent. *Syn.* SPECIES ASTRINGENTES, L. The roots of bistort and tormentil, and bark of pomegranate, equal parts. (P. Cod.)

Species, Bitter. *Syn.* THREE BITTER HERBS; SPECIES AMARÆ, HERBÆ AMARÆ, L. The leaves of germander, and dried tops of lesser centaury and wormwood, equal parts. (P. Cod.)

Species, Capillary. *Syn.* FIVE CAPILLARY HERBS; HERBÆ QUINQUE CAPILLARES, L. Hart's tongue, black maiden-hair, white do., golden do., and spleenwort, equal parts. (Ph. L. 1720.)

Species, Cordial. *Syn.* FOUR CORDIAL FLOWERS; SPECIES CORDIALES, L. The flowers of borage, bugloss, roses, and violets, equal parts. (Ph. L. 1720.)

Species, Diuretic. *Syn.* APERITIVE ROOTS, APERITIVE SPECIES; SPECIES DIURETICÆ, L. 1. (FIVE GREATER APERITIVE ROOTS—P. Cod., & Ph. E. 1744.) The dried roots of asparagus, butcher's-broom, parsley, smallage, and sweet fennel, equal parts.

2. (FIVE LESSER APERITIVE ROOTS.) Those of caper, dog-grass, eryngo, madder, and rest-harrow.

Species, Emollient. *Syn.* SPECIES EMOLLIENTES, L. 1. (THREE EMOLLIENT MEALS; FARINÆ EMOLLIENTES.) The meal of barley, linseed, and rye, equal parts. (P. Cod.)

2. (FIVE EMOLLIENT HERBS; HERBÆ QUINQUE EMOLLIENTES.)—*a.* The dried leaves of groundsel, common mallow, marsh-mallow, great mullein, and wall pellitory, equal parts. (P. Cod.)

b. The leaves of mallow, marsh-mallow,

French mercury, pellitory of the wall, and violet. (Ph. E. 1744.)

Species for Ene'mas. *Syn.* HERBS FOR CLYSTERS; HERBÆ PRO ENEMATIBUS, L. Mallow leaves, 2 parts; chamomile flowers, 1 part.

Species for Fomentations. *Syn.* SPECIES PRO FORTU, HERBÆ PRO FORTU, L. Leaves of southernwood, tops of sea-wormwood, and flowers of chamomile, of each, 2 parts; bay leaves, 1 part.

Species, Hot. 1. (FOUR GREATER HOT SEEDS.) The seeds of anise, caraway, cumin, and fennel.

2. (FOUR LESSER HOT SEEDS.) The seeds of bishop's weed, smallage, stone parsley, and wild carrot.

Species, Laxative. *Syn.* ST. GERMAIN LAXATIVE POWDER; SPECIES LAXANTES ST. GERMAIN, L. *Prep.* (Ph. Bor.) Senna leaves (exhausted with spirit), 4 oz.; elder flowers, 2½ oz.; aniseed and fennel seed, of each, 1½ oz.; reduce them to coarse powder, and, when dispensing, add of powdered cream of tartar, 1 dr., to each 1½ oz. of the mixture.

Species, Narcotic. *Syn.* FOUR NARCOTIC HERBS; SPECIES NARCOTICÆ, L. Dried leaves of belladonna, black nightshade, henbane, and thorn-apple, equal parts.

Species, Pectoral. *Syn.* SPECIES BRONCHICÆ, SPECIES AD INFUSUM PECTORALES, L. 1. Mallow root, 4 oz.; coltsfoot leaves, 2 oz.; liquorice root, 1½ oz.; aniseed, great-mullein flowers and red-poppy flowers, of each, 1 oz.; orris root, ½ oz. (Ph. Bor.)

Species, Refri'gerant.—1. (FOUR COLD SEEDS.) The seeds of cucumber, gourd, melon, and water-melon.

2. (FOUR LESSER COLD SEEDS.) The seeds of endive, lettuce, purslane, and succory.

Species, Resolvent. *Syn.* FARINÆ RESOLVENTES, L. The meal of the seeds of barley, bean, tare, and white lupin.

SPECIFIC GRAVITY is the comparative weights of equal bulks of different substances, the assumed standard being 1 and sometimes 1000. This standard is pure distilled water for liquids and solids, and atmospheric air for gaseous bodies and vapours.¹ In England the sp. gr., unless when otherwise expressed, is always taken at 60° Fahr.; but in France it is taken at 32° Fahr. (0° C.), or the temperature of melting ice. In the 'British Pharmacopœia,' whenever specific gravity is mentioned, the substance spoken of is supposed to be of the temperature of 60° Fahr. In most cases, however, it is sufficient merely to note the temperature, and to apply a correction, depending on the known density of water, or air, at the different degrees of the thermometric scale.

To determine the specific gravity of a solid, we weigh it, first in the air, and then in water. In the latter case it loses, of its weight, a

¹ By many modern chemists hydrogen, the lightest substance in nature, is taken as the standard for the specific gravity of gases and vapours.

quantity precisely equal to the weight of its own bulk of water; and hence, by comparing this weight with its total weight, we find its specific gravity. The rule is—Divide the total weight by the loss of weight in water; the quotient is the specific gravity.

The specific gravity of a substance lighter than water may be determined by attaching it to some substance, as a piece of lead, the sp. gr., &c., of which are known. In this way, by deducting the loss in weight of the two substances, when weighed in water, from the loss sustained by the lead alone, when so weighed, we obtain a difference (*a*) which, added to the weight of the substance taken in air (*b*), gives the respective densities. From these the sp. gr. is found by the rule of three:—

$$(a + b) : 1 :: b : \text{sp. gr.}$$

The specific gravity of substances soluble in water are taken in pure oil of turpentine, rectified spirit, olive oil, or some other liquid, the density of which is exactly known. Sometimes, for rough purposes, the article is covered with a coating of mastic varnish. This last method answers for mercurial pill.

The specific gravity of a substance in fragments, or in powder, may be found by putting a portion (say 100 grs.) into a sp. gr. bottle, filling the latter with distilled water, and then weighing it. The weight of water which it is found to contain, deducted from 1000 (the weight of the bottle when filled with distilled water), gives a difference (*a*) which bears the same relation to the sp. gr. of water (1.000) as the weight of the powder (*b*) put into the bottle does to the required sp. gr. Or—

$$a : 1.000 :: b : \text{sp. gr.}$$

The specific gravity of alloys and mixtures, when no condensation has occurred, is equal to the sum of the weights divided by the sum of the volumes, compared to water reckoned as unity; and is not merely the arithmetical mean between the two numbers denoting the two sp. gr., as is frequently taught. See BEADS (Lovi's), HYDROMETER, MIXTURES (Arithmetic of), &c. For the mode of determining the specific gravity of gases, the reader is referred to the works on chemistry of Miller and Fownes.

The specific gravity of a liquid is found by weighing it in a sp. gr. bottle, glass flask, or other vessel of known capacity, and dividing that weight by the weight of the same bulk of water; the quotient is, as before, the specific gravity. A bottle of the capacity of 1000 water-grains (specific gravity bottle) gives the density of a liquid at once, by simply filling it to the given mark, and then accurately weighing it.

SPECTACLES. See EYE, VISION, &c.

SPECTROSCOPE. An instrument devised for examining the spectra of flames. (See below.)

SPECTRUM ANALYSIS. A method of

determining the chemical constituents of substances, devised by Kirchhoff and Bunsen. It consists in letting the rays of a flame, coloured by the substance under examination, pass first through a narrow slit, then through a prism, and observing them, when thus refracted, through a telescope. A distinct spectrum is obtained for every flame-colouring metal; thus, sodium, which gives a yellow colour to the flame, has a spectrum consisting of a double yellow line; potassium, which burns with a purple light, gives red and blue lines; lithium also gives red and blue lines, but they are of a different tint and in a different part of the spectrum; calcium gives red, yellow, green, and blue lines; barium a great number of green lines, and so on. To produce a suitable flame, of great heating power but small luminosity, a Bunsen's gas-lamp is usually employed; in this flame the substance to be examined is burned on a loop of fine platinum wire. The instrument employed for producing and viewing the spectra is called a spectro-scope. This method of analysis is so delicate, that a quantity of sodium but little exceeding the millionth part of a grain may be detected by it. Since its introduction, four new metals have been discovered by it, namely, cesium, rubidium, thallium, and indium.¹ See **FLAME COLOURS**, &c.

SPECULUM METAL. *Prep.* 1. Take of copper, 64 parts; pure tin, 29 parts; melt them separately under a little black flux; next incorporate them thoroughly by stirring with a wooden spatula, and run the metal into the moulds, so that the face of the intended mirror may be downwards; lastly, allow the whole to cool very slowly.

2. Pure copper, 2 parts; pure tin, 1 part. Used to make the mirrors of reflecting telescopes. The addition of a little metallic arsenic renders it whiter.

SPELTER. See **ZINC**.

SPERMACETI. *Syn.* CETACEUM (B. P., Ph. L. E. & D.), L. A concretion prepared from the oily matter of the head of the *Phasetes macrocephalus*, or spermaceti whale. It is demulcent and emollient; chiefly used in ointments and cerates.

SPHEROIDAL STATE. It is found that water, or any other volatile liquid, thrown on a metallic plate heated to dull redness, is not resolved into vapour, but, assuming a somewhat globular form, remains intact, until the temperature becomes sufficiently lowered to allow of contact between the liquid and the heated surface. It is then immediately volatilised. M. Boutigny, who fully investigated this subject, has also shown that the same thing happens when a solid body containing water is substituted for the liquid in the above and similar experiments. Thus, the finger or hand, under certain restrictions, may be thrust, with perfect impunity, into a stream

of molten metal, and ice may be produced by throwing water into a red-hot crucible. This last experiment, as performed by MM. Boutigny and Prevostaye, is essentially as follows:—A thick platinum crucible, of the capacity of 1 fl. oz., is heated to redness over a powerful spirit lamp, and some liquid anhydrous sulphurous acid (a very volatile substance) poured into it by means of a pipette; the acid assumes a spheroidal form, and does not evaporate; a few drops of water are now introduced into the sulphurous acid in the same way; the diluted and slightly cooled acid instantly flashes off in vapour, and, robbing the water of its caloric, leaves the latter in a frozen state; and, if the operator seizes the right moment, a solid lump of ice may be thrown out of the red-hot crucible.

SPICE. A general name for vegetable substances possessing aromatic and pungent properties, and employed for seasoning or flavouring food.

Spice, Horse. *Syn.* COW SPICE; SPECIES EQUINUS, L. *Prep.* 1. Aniseed, allspice, cumin seed, ginger, liquorice, and Jumeric, equal parts.

2. Turmeric and cumin seed, of each, 5 lbs.; ginger, 2½ lbs. Used by farriers.

Spice, Kitchen. *Syn.* MIXED SPICE, KITCHEN PEPPER, &c. *Prep.* From black pepper, 2 lbs.; ginger, 1 lb.; cinnamon, allspice, and nutmegs, of each, 8 oz.; cloves, 1 oz.; dry salt, 6 lbs.; well ground together. Useful to flavour gravies, soups, &c.

Spice, Mixed. As the last, omitting half the salt.

Spice, Pease. See **POWDER**.

Spice, Ragout. *Prep.* From dry salt, 1 lb.; flour of mustard, black pepper, and grated lemon peel, of each, ½ lb.; cayenne pepper, 2 oz.; allspice and ginger, of each, 1 oz.; nutmeg, ½ oz.; all separately powdered.

Spice, Sausage (French). *Syn.* EPICE FINES, Fr. *Prep.* From black pepper, 5 lbs.; ginger 2½ lbs.; cloves and nutmegs, of each 1 lb.; aniseed and coriander seeds, of each, ½ lb.; powder and mix them.

Spice, Savoury. *Prep.* 1. (Kidder's.) From cloves, mace, nutmegs, pepper, and salt, equal parts. Used by cooks.

2. (Dr. Kitchener's.) See **RAGOUT SPICE** (above).

Spice, Soup. *Syn.* KITCHENER'S SOUP-HERB POWDER, KITCHENER'S VEGETABLE RELISH, &c. *Prep.* From parsley, lemon thyme, sweet marjoram, and winter savoury, of each, dried, 2 oz.; sweet basil and yellow peel of lemon, of each, dried, 1 oz.; mix, and powder.

Spice, Sweet (Kidder's). *Prep.* From cinnamon, cloves, mace, nutmegs, and sugar, equal parts. Used in pastry.

SPIGELIA. *Syn.* CAROLINA PINK ROOT; SPIGELIA (Ph. E.), L. The root of *Spigelia Marilandica*, or worm grass. It is purgative, narcotic, and vermifuge.—*Dose.* 10 to 40 grs., in powder or infusion, night and morning,

¹ See the last edition of Fownes's "Manual of Chemistry," and Watts's "Dic. of Chemistry."

until the worms are expelled. Rhubarb or calomel is commonly added to it.

SPIRIT. *Syn.* SPIRITS, L. Under this term are included all the inflammable and intoxicating liquors obtained by distillation, and used as beverages, as BRANDY, GIN, RUM, &c., each of which is noticed in its alphabetical

order. Spirit may also be obtained by fermentation and distillation from all vegetable juices or solutions that contain sugar.

The spirit used in pharmacy and chemistry is distinguished by names which have reference to its richness in alcohol. (See TABLES.)

I. TABLE of the Pharmacopœial Spirits.

Alcohol, Ph. B. (absolute).	Sp. gr.		Rectified Spirit, Ph. D.	Sp. gr.
" Ph. E.	0.795	nearly pure	Proof Spirit (Spiritus Tenuior), Ph. B.	0.840 or 54 $\frac{1}{2}$ o. p.
" Ph. D. 1826	0.796	Alcohol.	" (at 40°)	0.920 "
" Ph. L. 1836	0.810 or 70 $\frac{1}{2}$ o. p.	"	Alcohol (absolu), P. Cod.	0.797 "
Stronger Spirit (Spiritus Fortior), Ph. D.	0.815 " 68 $\frac{1}{2}$ "	"	" (du commerce), P. Cod.	0.810 " 70 $\frac{1}{2}$ "
*Rectified Spirit (Spirit of Wine; Spiritus Rectificatus), B. P.	0.818 " 66 $\frac{1}{2}$ "	"	" (faible)	0.863 " 41 $\frac{1}{2}$ "
	0.838 " 56 $\frac{1}{2}$ "	"		0.923 " 2 $\frac{1}{2}$ u. p.

* "This spirit can be reduced to the standard of the weaker (or proof) spirit, by adding, to every 5 pints of it, 3 pints of distilled water, at 62° Fahr." (Ph. L.)

II. TABLE of the principal Spirituous Liquors sold in England, with their usual Strengths, &c.

Denomination.	Revenue Mark.	Import Strength.	Legal Limits of Strength.	Usual Selling Strength.			Specific Gravity at 60° Fahr.
				By Permit.	Contains Alcohol of 0.825.	Contains Absolute Alcohol.	
*Gin (strongest)	X (17 u. p.)	Not stronger than 25 o. p.	17 u. p.	40 $\frac{3}{4}$	0.9395
*Do. (best ordinary)	X (22 u. p.)	do.	22 u. p.	37 $\frac{1}{2}$	0.9445
†Do. (cordial)	X (22 u. p.)	do.	22 u. p.	do.	10°
†Do. (24 u. p.)	X (24 u. p.)	do.	24 u. p.	36 $\frac{1}{2}$	10°
†Peppermint	X mint.	do.	60 u. p.	21 $\frac{1}{2}$	10°
†Do.	do.	do.	64 u. p.	16 $\frac{1}{2}$	10°
†Cloves		do.				
†Bitters		do.				
†Raspberry		do.				
†Noyau		do.				
†Cinnamon		do.				
†Tent		do.				
†Aniseed		do.				
†Caraway		do.				
†Lemon		do.				
†Usquebaugh		do.				
†Orange Cordial		do.				
†Citron		do.				
Rum	R.	About 10 o. p. to 43 o. p.	No limit.	11 u. p.	43 $\frac{1}{2}$	0.9329 to 0.9597
*Rum Shrub	R. Sh.	do.	64 u. p.	18 $\frac{1}{2}$	10°
†Do.	do.	do.	60 u. p.	21 $\frac{1}{2}$	10°
French Brandy	F.	About 5 o. p. to 8 or 10 u. p.	do.	10 u. p.	44 $\frac{1}{2}$	0.9318
§Spirit of Wine	S. W.	Not less than 43 o. p.	54 to 64 o. p.	0.8415 to 0.8321
Malt, grain, or malasses spirit (sent out by British distillers)	P. S.	Not stronger than 25 o. p.	0.8669 to 0.9318
Hollands	Geneva.	No limit.	51-60 $\frac{3}{4}$	40-5 $\frac{1}{2}$	0.9358
Whiskey (Irish)	P. S.	Not stronger than 25 o. p.	54 $\frac{1}{2}$	50 $\frac{1}{2}$	
Do. (Scotch)	P. S.	Not stronger than 25 o. p.	54 $\frac{1}{2}$	50 $\frac{1}{2}$	

* Frequently retailed at 25 to 35 u. p.

† Though 'permitted' at 22 to 24, are generally from 5 to 35 u. p., or even weaker.

‡ These, though 'permitted' at 60 or 64 u. p., are generally 75 or 80 u. p.

§ Usual strength 54 to 60 o. p.

|| The specific gravity is no guide when sugar is present, as in compounds.

Spirituous liquors, like all other fluids at common temperatures, expand when they are heated, and diminish in volume when they are cooled. It is found that 1000 galls. of proof spirit, measured at the temperature of 50° Fahr., will, if re-measured at 59°, be found to have increased in bulk to fully 1004½ galls.; whilst 1000 galls. of the same spirit, measured at 77° Fahr., will be only equal to 991½ galls. at 59°. These changes are still more marked at higher strengths, and at extreme temperatures, and, from not being recognisable by the hydrometer, often lead to serious losses in trade, and to serious fluctuations in 'stock,' which, to those unaware of the action of temperature, are perfectly unaccountable. A gallon of proof spirit only weighs 9½ lbs. at 60° Fahr. At a higher temperature it will weigh less—at a lower one, more; but as this weight constitutes the standard gallon at the temperature the proof is calculated for, it is manifest that any variations from it must result in loss either to the buyer or seller. Hence the equity of buying and selling liquors by weight, instead of by measure. The stock-keeper in every wholesale house should be aware of this fact, and on 'taking stock' should as regularly enter the temperature of his liquors in his stock-book as he does the 'dip' or 'wet inches.' See ALCOHOL, ALCOHOLOMETRY, SPECIFIC GRAVITY, SPIRITS (Medicinal), SPIRITS (Perfumed), &c.

Spirit, Amylic. See FUSEL OIL.

Spirit, Dyer's. See TIN MORDANTS.

Spirit, Methylated. Spirit of wine to which one tenth of its volume of wood naphtha (strength not less than 60° o. p.) has been added, the object of such addition being that of rendering the mixture unpotable through its offensive odour and taste. The purification of this mixed spirit, or the separation of the two alcohols, though often attempted, has always proved a failure. It might be supposed that, owing to the low boiling-point of methylic alcohol, simple distillation would effect this; but experience has shown that both spirits distil over simultaneously. This is, no doubt, due to the difference of their vapour densities. Methylated spirit, being sold duty free, can be employed by the chemical manufacturer as a solvent in many processes for which, from its greater cost duty-paid spirit would be commercially inapplicable. But in the preparation of medicines, containing spirit, as the vehicle or menstruum by which more active substances are administered, the employment of methylated spirit is highly improper. The Council of the Pharmaceutical Society obtained from the Pharmacopœia Committee of the Medical Council, the decided opinion that "the substitution of 'methylated' for 'rectified' spirit in any of the processes of the Pharmacopœia should be strictly prohibited."

The use of methylated spirit in the preparation of tinctures, sweet spirit of nitre, common

ether, or any medicine to be used internally, is now prohibited by law.

Spirit, Proof. See *above*.

Spirit, Pyroacetic. *Syn.* ACETONE; SPIRITUS PYROACETICUS, L.; ACÉTONE, ESPRIT PYROACÉTIQUE, Fr. An inflammable volatile liquid obtained with carbonic acid and other products when the metallic acetates in an anhydrous state are subjected to destructive distillation. The acetate of lead is the most eligible salt for this purpose.

Prep. 1. Dried acetate of lead is carefully distilled in a large earthen or coated-glass retort, by a heat gradually raised to redness, the volatile products being passed through a condenser well supplied with cold water. The distillation is continued until nothing but finely divided lead (lead pyrophorus) remains in the retort. The receiver contains crude acetone, which is to be saturated with carbonate of potassa, and afterwards rectified in a water bath from chloride of calcium.

2. By passing the vapour of strong acetic acid through an iron tube heated to dull redness, and condensing the acetone thus formed.

Obs. In both of the above processes carbonic acid and other permanent gases are produced, consequently the receiver must not fit too closely to the tube of the condenser.

Prop. Colourless, limpid, of peculiar odour, and very inflammable, giving a brilliant flame, without smoke; boiling-point 132° Fahr.; sp. gr. 792. It dissolves resins and essential oils. See MESITLOL, MESITYL, METACETONE, &c.

Spirit, Pyroxylic. *Syn.* PYROLIGNEOUS SPIRIT, WOOD S., MEDICINAL NAPHTHA, WOOD N., HYDRATED OXIDE OF METHYL; SPIRITUS PYROXYLICUS (Ph. D.), L. A light volatile liquid, discovered by P. Taylor, in 1812, among the limpid products of the distillation of dry wood. It has been shown by Dumas and Peligot to be "really a second alcohol, forming an ether, and a series of compounds (MYTHYL-SERIES) exactly corresponding with those of vinous spirit, and, in some points, even more complete than the latter."

Prep. Crude pyroligneous acid (which contains about 1½ of the spirit) is subjected to distillation, and the first or more volatile portion which passes over is neutralised with hydrate of lime. After repose, the clear liquid is separated from the oil which floats on the surface, and from the sediment at the bottom of the vessel; this, when redistilled, forms the wood spirit of commerce. It may be strengthened in the same manner as ordinary alcohol, by rectification, and ultimately rendered pure by careful distillation from quicklime by the heat of a water bath. Berzelius recommends the crude spirit to be agitated with a fatty oil, to remove empyreumatic matter, and then to rectify it, first, from recently burnt charcoal, and next with chloride of calcium.

Prop., &c. Pure pyroxylic spirit is a transparent colourless liquid, having a penetrating ethereal smell, and a hot disagreeable taste; it is very inflammable, burning with a pale blue flame. It is neutral to test paper; mixes with water, alcohol, and ether, in all proportion; and boils at 152° Fahr.; sp. gr. .798 at 68° Fahr. (Regnault and Liebig.) Dr. Ure states the sp. gr. to be .824 at 60°; the Dublin College makes it .846. That of the latter must therefore have contained a little water. It does not dissolve India rubber and gutta percha, like mineral or true naphtha.

Pyroxylic spirit is distinguished from acetone or pyroacetic spirit by the character of its flame, and by freely dissolving chloride of calcium, which is quite insoluble in the latter. In a mixture of these two liquids two distinct strata are formed when this substance, either in powder or concentrated solution, is added.

Pyroxylic spirit is distinguished from vinous spirit by Nessler's test (which see), by its forming a solid crystalline salt (methyl oxalate) when distilled with an oxalate and sulphuric acid, and by its lower boiling-point. The presence of alcohol, in a mixture of the two, is readily detected by distilling the suspected sample with sulphuric acid. The formation of common ether indicates ethylic alcohol, and from the amount formed the proportion of alcohol may be determined.

Uses, &c. Chiefly to dissolve resins and volatile oils, especially shell-lac, and as a substitute for alcohol in spirit lamps. As a medicine, it is anodyne and sedative; and has been beneficially employed by Drs. Christison, Hastings, and Neligan, to allay the harassing cough, troublesome vomiting, and excessive expectoration, in phthisis and some other affections.—*Dose.* 5 to 30 drops, thrice a day, in water.

Spirit, Raisin. *Prep.* From raisins fermented along with water, and the wash distilled by a quick fire. *Used* to give a brandy flavour to malt spirit. 1 gal. added to 150 galls. of plain spirit, along with some colouring, and a little catechu, either with or without a little acetic ether, makes a very decent 'British Brandy.'

Spirit, Rectified. See ALCOHOL, and TABLE I, under SPIRIT.

Spirit of Salt. Hydrochloric acid.

Spirit of Soup-herbs. As essence of soup-herbs, but substituting 1 quart of brandy or proof spirit for the rectified spirit.

Spirit of Wine. See ALCOHOL, and TABLE I, under SPIRIT.

SPIRITS (Medicinal). *Syn.* SPIRITUS MEDICINALES, L. The spirits of pharmacy are either prepared by macerating the bruised seeds, flowers, herbs, &c., in the spirit, for 2 or 3 days before distillation, and then drawing it off by a gentle heat; or extemporaneously, by adding a proper proportion of essential oil to pure spirit of the prescribed strength. This

latter plan is very generally adopted in the Ph. D. In the first method, when a naked fire is employed, a little water is put into the still along with the spirit, to prevent empyreuma. These spirits are principally employed as aromatics and stimulants, or as adjuvants in draughts and mixtures.

The following are the principal medicinal spirits:—

Spirit of Ammonia. *Syn.* SPIRITUS AMMONIÆ (Ph. E.). *Prep.* 1. (Ph. E.) Take of quicklime, 12 oz.; slake it with water, 6½ fl. oz.; add of finely powdered chloride of ammonium, 3 oz.; and distil in a glass retort furnished with a tube reaching nearly to the bottom of a bottle containing rectified spirit, 2 pints, and kept well cooled. A sand heat is to be employed, and the distillation continued as long as anything passes over. The product has a sp. gr. about .845, and should not effervesce with acids. The alkali is here in the caustic state, and in this respect it resembles the spirit of ammonia, Ph. U. S., and Dzond's caustic spirit of ammonia, Ph. Bor.

2. (Ph. L. 1836.) Chloride of ammonium, 10 oz.; carbonate of potassa, 16 oz.; rectified spirit and water, of each, 3 pints; mix, and let 3 pints distil.

3. (Ph. D. 1826.) Dissolve 3½ oz. of carbonate of ammonia, in rectified spirit, 3 wine pints.

Obs. The ammonia in the last two preparations exists in the carbonated state. They are chiefly employed to make other preparations.

4. (ANISATED SPIRIT OF AMMONIA; LIQUEUR AMMONIÆ ANISATÆ, SPIRITUS A. A.—Ph. Bor.) Rectified spirit, 12 oz.; oil of aniseed, 3 drs.; dissolve, and add of caustic solution of ammonia (.960), 3 oz.

5. (AROMATIC SPIRIT OF AMMONIA, SPIRIT OF SAL VOLATILE; SPIRITUS AMMONIÆ AROMATICUS—B. P., Ph. L. E. & D.)—*a.* (Ph. L.) Take of hydrochlorate of ammonia, 6 oz.; carbonate of potassa, 10 oz.; cinnamon and cloves, of each, bruised, 2½ drs.; fresh lemon peel, 5 oz.; rectified spirit and water, of each, 2 quarts; mix, and distil 3 quarts. Sp. gr. .918.

b. (Ph. E.) Spirit of ammonia, 8 fl. oz.; oil of rosemary, 1½ fl. dr.; oil of lemon peel, 1 fl. dr.; mix.

c. (Ph. D.) Rectified spirit, 3 pints; oil of lemon, ½ fl. oz.; oil of nutmeg, 2 fl. drs.; oil of cinnamon, ½ fl. dr.; dissolve, and add of stronger solution of ammonia, 6 fl. oz. Sp. gr. .852.

d. (B. P.) Carbonate of ammonia, 8 oz.; strong solution of ammonia, 4 oz.; volatile oil of nutmeg, 4 drs.; oil of lemon, 6 drs.; rectified spirit, 6 pints; water, 3 pints; distil 7 pints.—*Dose.* 20 to 60 minims in camphor water.

Obs. The ammonia exists in the state of neutral carbonate in the product of the *a* formula, but in the caustic state in those of the others.—*Dose.* ½ to 1 fl. dr., in water, &c. any bland liquid; as a diffusible stimulant and

antacid, in debility, low spirits, dyspepsia, heartburn, flatulent colic, hysteria, &c. The spirit of sal volatile of the shops is generally a spurious compound of little more than half the above strength.

6. (FETID SPIRIT OF AMMONIA; SPIRITUS AMMONIÆ FETIDUS—B. P., Ph. L. E. & D.), L.—a. (Ph. E.) Hydrochlorate of ammonia, 10 oz.; carbonate of potassa, 16 oz.; assafœtida, 5 oz.; rectified spirit and water, of each, 3 pints; mix well, then slowly distil 3 pints. Sp. gr. '861.

b. (Ph. E.) Spirit of ammonia, $10\frac{1}{2}$ fl. oz.; assafœtida (broken small), $\frac{1}{2}$ oz.; digest for 12 hours, then distil $10\frac{1}{2}$ fl. oz., by the heat of a vapour (water) bath.

c. (Ph. D.) Assafœtida, $1\frac{1}{2}$ oz.; rectified spirit, $1\frac{1}{2}$ pint; digest for 24 hours, then distil off the whole of the spirit, and mix the product with stronger solution of ammonia, 3 fl. oz. Sp. gr. '849.

d. (B. P.) Strong solution of ammonia, 2; assafœtida, in small pieces, $1\frac{1}{2}$; rectified spirit, sufficient; macerate the assafœtida in 15 of the spirit for 24 hours, distil, add the distillate to the ammonia, and make up with spirit to 20. —Dose. $\frac{1}{2}$ to 1 dr.

Obs. The dose, &c., are the same as those of the last, but it is preferred for hysterical and spasmodic affections.

Spirit, Amylic. Syn. ALCOHOL AMYLIUM (Ph. D.), L. See FUSSEL OIL.

Spirit of Aniseed. Syn. SPIRITUS ANISI (Ph. L.), L. Prep. 1. (Ph. L.) Oil of aniseed, 3 fl. drs.; proof spirit, 1 gal.; dissolve. Carminative.—Dose. $\frac{1}{2}$ fl. dr. to 4 fl. drs.

2. (ESSENTIA ANISI—Ph. D.) Oil of aniseed, 1 fl. oz.; rectified spirit, 9 fl. oz.; mix with agitation. Chiefly used to make aniseed water.

3. (COMPOUND SPIRIT OF ANISEED; SPIRITUS ANISI COMPOSITUS—Ph. D. 1826.) Aniseed and angelica seed, of each, $\frac{1}{2}$ lb.; proof spirit, 1 gal.; water, q. s.; distil 1 gallon. When coloured with saffron, or sap green, it closely resembles the Irish usquebaugh. (Montgomery).—Dose. 1 to 4 fl. drs.

Spirit, Arquebusade'. See VULNERARY SPIRIT (below).

Spirit of Balm (Compound). Syn. BALM WATER, CARMELITE W.; AQUA MELISSÆ COMPOSITA, SPIRITUS M. COMPOSITUS, &c.; EAU DES CARMES, EAU DE MELISSE DES CARMES, &c. Prep. 1. (P. Cod.) Fresh flowering tops of balm, 24 oz.; fresh lemon peel, 4 oz.; cinnamon, cloves, and nutmegs, of each, 2 oz.; coriander seed and dried angelica root, of each, oz.; rectified spirit, 8 lbs.; macerate for 8 ys and distil in a water bath to dryness. The spirit is much esteemed in France as a stomachic, a cosmetic, and a stimulant.

Spirit, Bath'ing. Soap liniment.

Spirit of Camphor. Syn. CAMPHORATED SPIRIT; SPIRITUS CAMPHORÆ (B. P., Ph. L.), L.; ETHER CAMPHORÆ, SPIRITUS CAMPHO-

RATUS, L. Prep. 1. (Ph. L.) Camphor, 5 oz.; rectified spirit, 1 quart; dissolve.

2. (B. P.) Camphor, 1; rectified spirit, 9; dissolve.—Dose. 10 to 30 minims, in milk or on sugar. Used as an application to chilblains, and in chronic rheumatism, cholera, &c. See DROPS, ESSENCE, and TINCTURE.

Spirit of Caraway. Syn. SPIRITUS CARUI (Ph. L. & E.), L. Prep. 1. (Ph. L.) Oil of caraway, 2 fl. drs.; proof spirit, 1 gal.; dissolve.

2. (Ph. E.) Caraway seeds (bruised), $\frac{1}{2}$ lb.; proof spirit, 7 pints; macerate for 2 days in a covered vessel, then add of water, $1\frac{1}{2}$ pint, and distil 7 pints. Aromatic and carminative.—Dose. 1 to 4 fl. drs. A similar spirit, "sweetened with sugar, is drunk in Germany as a dram (KÜMELLEQUEUR; KÜMELLEBRANDTWEIN).

3. (ESSENTIA CARUI—Ph. D.) Oil of caraway, 1 fl. oz.; rectified spirit, 9 fl. oz. Used to make caraway water.

Spirit of Cassia. Syn. SPIRITUS CASSIÆ (Ph. E.), L. Prep. From coarsely powdered cassia, 1 lb.; proof spirit, 7 pints; water, $1\frac{1}{2}$ pint, or q. s.; draw off 7 pints.—Dose, &c., as the last. It is almost universally substituted for spirit of cinnamon.

Spirit of Cinnamon. Syn. SPIRITUS CINNAMOMI (Ph. L. & E.), L. Prep. 1. (Ph. L.) Oil of cinnamon, 2 fl. drs.; proof spirit, 1 gal.; dissolve.

2. (Ph. E.) From cinnamon, as spirit of cassia.—Dose. 1 to 4 fl. drs.

3. (ESSENTIA CINNAMOMI—Ph. D.) Oil of cinnamon, 1 fl. oz.; rectified spirit, 9 fl. oz. Used to make cinnamon water, &c.

Spirit of Ether. Syn. SPIRIT OF SULPHURIC ETHER, SWEET SPIRIT OF VITRIOL; SPIRITUS ETHERIS (B. P.), SPIRITUS ETHERIS SULPHURICI (Ph. E.), L. Prep. 1.—a. (Ph. E.) Sulphuric ether, 1 part; rectified spirit, 2 parts. Sp. gr. '809. Obs. This preparation should be neutral to test paper, mix (clear) with water, and, when shaken with twice its volume of concentrated solution of chloride of calcium, 28% of ether should separate.—Dose. $\frac{1}{2}$ to 2 or 3 fl. drs.; as a stimulant and anodyne.

b. (B. P.) Ether, 1; rectified spirit, 2; mix.—Dose. 30 to 60 minims.

2. (COMPOUND SPIRIT OF ETHER, HOFFMANN'S ANODYNE LIQUOR; SPIRITUS ETHERIS COMPOSITUS (Ph. L.), S. ETHERIS OLIVOSUS (Ph. D.), L.—a. (Ph. L.) Ether, 8 fl. oz.; rectified spirit, 16 fl. oz.; ethereal oil, 3 fl. drs.; mix.

b. (Ph. D.) Mix in a glass matrass, oil of vitriol, $1\frac{1}{2}$ pint, with rectified spirit, 1 pint; connect this with a Liebig's condenser, apply heat, and distil until a black froth begins to rise; then separate the upper stratum of the distilled liquid, and, having exposed it to the air for 24 hours, let the oil be transferred to a moist paper filter, and washed with a little cold water; lastly, dissolve it in a mixture of, rectified spirit, $\frac{1}{2}$ pint; sulphuric ether, 5 fl. oz.

Obs. This compound is anodyne and antispasmodic, and was once held in very great repute.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.

3. (AROMATIC SPIRIT OF ETHER, A. S. OF SULPHURIC E., SWEET ELIXIR OF VITRIOL†; SPIRITUS ÆTHERIS AROMATICUS, L. *Prep.* (Ph. L. 1824.) Bruised cinnamon, 3 drs.; cardamoms, $\frac{1}{2}$ dr.; long pepper and ginger, of each, 1 dr.; rectified spirit, 10 fl. oz.; sulphuric ether, 5 fl. oz.; mix, and digest 14 days. The last two preparations are also frequently called 'sweet elixir of vitriol.'

Spirit of Hartshorn. *Syn.* LIQUOR OF SPIRITUS VOLATILIS CORNU CERVI, L. Originally distilled from hartshorn. Dilute liquor of ammonia is now generally sold for spirit of hartshorn.

Spirit of Horseradish (Compound). *Syn.* SPIRITUS ARMORACIÆ COMPOSITUS (B. P., Ph. L.). *Prep.* 1. (Ph. L.) Sliced horseradish and dried orange peel, of each, 20 oz.; bruised nutmegs, 5 drs.; proof spirit, 1 gal.; water, 1 quart, or q. s.; distil 1 gal. Stimulant and diuretic.—*Dose.* 1 to 4 fl. drs.; in dropsies, when there is much debility. It is usually combined with infusion of juniper berries or foxglove.

2. (B. P.) Fresh root, sliced, 20; dried orange peel, 20; nutmeg, bruised, $\frac{1}{2}$; proof spirit, 160; water, 40; mix, and distil over 160.—*Dose.* 1 to 3 drs.

Spirit of Hydrochloric Ether. *Syn.* SPIRIT OF MURIATIO ETHER, CLUTTON'S FEBRIFUGE SPIRIT; ÆTHER HYDROCHLORICUS ALCOHOLICUS, SPIRITUS ÆTHERIS MURIATIONI, L. *Prep.* 1. From hydrochloric ether and rectified spirit, equal parts; mixed together.

2. (Ph. E. 1744.) Hydrochloric acid, 1 part; rectified spirit, 3 parts; digest some days, and distil in a sand bath.—*Dose.* $\frac{1}{2}$ to 3 fl. drs.; in dyspepsia, liver complaints, hectic fever, &c. **Spirit of Juniper.* *Syn.* SPIRITUS JUNIPERI (B. P.). *Prep.* English oil of juniper, 1; rectified spirit, 49; dissolve.—*Dose.* 30 to 60 minims.

Spirit of Juniper (Compound). *Syn.* SPIRITUS JUNIPERI COMPOSITUS (Ph. L. E. & D.). *Prep.* 1. (Ph. L.) Oil of juniper, $\frac{1}{2}$ fl. dr.; oils of caraway and fennel, of each, 12 drops; proof spirit, 1 gal.; dissolve.

2. (Ph. L. 1836.) Juniper berries, bruised, 15 oz.; caraway and fennel seed, of each, bruised, 2 oz.; proof spirit, 1 gal.; water, 1 quart, or q. s.; distil 1 gallon.

Obs. This spirit is stimulant and diuretic.—*Dose.* 2 to 4 fl. drs. Mixed with twice or thrice its weight of proof spirit, and sweetened with a little sugar, it makes no bad substitute for Hollands gin.

Spirit of Lavender. *Syn.* SPIRITUS LAVANDULÆ (B. P., Ph. E.), L. *Prep.* From fresh lavender, 2½ lbs.; rectified spirit, 1 gal.; water, 1 quart, or q. s.; distil 1 gallon (7 pints—Ph. E.).

2. (Wholesale.) From Mitcham oil of lavender, 3 oz.; rectified spirit, 1 gal.; dissolve. Cordial and fragrant.

3. (B. P.) English oil of lavender, 1; rectified spirit, 49; dissolve.—*Dose.* 30 to 60 minims. See SPIRITS (Perfumed), TINCTURES, &c.

Spirit of Nitric Ether. *Syn.* SPIRIT OF NITROUS ETHER, SWEET SPIRIT OF NITRE, NITROUS ETHEREAL SPIRIT, NITRE DROPS; SPIRITUS ÆTHERIS NITRICI (B. P., Ph. E.), SPIRITUS ÆTHERIS NITROSI (Ph. D.), L. *Prep.* 1. (Ph. L.) Take of rectified spirit, 1 quart; nitric acid, 3½ fl. oz.; add the acid, by degrees, to the spirit; then mix them, and let 28 fl. oz. distil over. An earthenware still and condensing worm should be employed. Sp. gr. .834.

2. (Ph. E.) Pure hyponitrous ether (Ph. E.), 1 part; rectified spirit, 4 parts; (both by volume;) mix. Sp. gr. .847.

3. (Ph. D.) Nitrous or hyponitrous ether (which has been washed with half of its volume of liquor of ammonia), 4 fl. oz.; rectified spirit, "in 42 fl. oz.; mix, and preserve the compound in small, strong, and accurately stopped bottles."

4. (B. P.) Nitric acid (sp. gr. 1.42), 3; sulphuric acid, 2; copper, in fine powder (No. 25), 2; rectified spirit, a sufficiency; to 20 of the spirit add gradually the sulphuric acid, stirring them together; then add to this, also gradually, 2½ of the nitric acid. Put the mixture into a retort or other suitable apparatus into which the copper has been introduced, and to which a thermometer is fitted. Attach not an efficient condenser, and, applying a gentle heat, let the spirit distil at a temperature commencing at 170° and rising to 175°, but not exceeding 180°, until 12 have passed over and been collected in a bottle kept cool, if necessary, with ice-cold water; then withdraw the heat, and, having allowed the contents of the retort to cool, introduce the remaining ½ of nitric acid, and resume the distillation as before, until the increased product has been increased to 15. Mix this with 40 of the rectified spirit, or as much as will make the product correspond to the tests of specific gravity and per-centage of ether separated by chloride of calcium. Preserve it in well-closed vessels.

Char. and Tests. Transparent, and nearly colourless, with a very slight tinge of yellow mobile, inflammable, of a peculiar penetrating apple-like odour, and sweetish, cooling, sharp taste. It effervesces feebly, or not at all, when shaken with a little bicarbonate of soda. When agitated with solution of sulphate of iron and a few drops of sulphuric acid, it becomes deep olive-brown or black. If it be agitated with twice its volume of a saturated solution of chloride of calcium in a closed tube, 2½ of the original volume will separate in the form of nitrous ether, and rise to the surface of the mixture. Sp. gr. .845.—*Dose.* 1 to 2 fl. dr.

Pur., &c. Pure spirit of nitric ether boils at about 160° Fahr., scarcely reddens litmus paper, and "gives off no bubbles of carbonic acid gas on the addition of carbonate of soda (Ph. L.) "When agitated with twice its volume of concentrated solution of chloride of calcium, 12½ of ether slowly separates." (Ph. E.)—*Dose.* $\frac{1}{2}$ to 3 fl. drs., as a febrifuge, and

phoretic, diuretic, antispasmodic, &c.; in various affections.

Obs. The mass of the sweet spirits of nitre of the shops is of very inferior quality, and is scarcely, if ever, made directly from spirit that has paid the duty. One, and a very large portion, is obtained from Scotland; another, from the manufacturers of fulminating mercury; and a third, and, in fact, the principal part, from certain persons in the neighbourhood of the metropolis who employ contraband spirit for its preparation, as this article is not under the excise. Recently methylated spirit has been employed for the purpose.

Sweet spirits of nitre, sp. gr. .850, is now commonly and publicly sold, in quantity, at a price which is only about 2-3rds that of the spirit in it, if the latter had paid duty. The spirit obtained from the manufacturers of fulminating mercury frequently contains no inconsiderable quantity of hydrocyanic acid.

The mere admixture of nitric or hyponitrous ether with alcohol does not afford an official SPIR. ETHER. NITR., as this always contains aldehyde, which, according to Prof. Liebig, is an essential constituent of the official compound.

Spirit of Nitrous Ether. *Syn.* SPIRITUS ÆTHERIS NITROSI (B. P.). See SPIRIT OF NITRIC ETHER.

Spirit of Nutmeg. *Syn.* SPIRITUS MYRISTICÆ (B. P., Ph. L. & E.), S. NUCIS MOSCHATÆ, L. *Prep.* 1. (Ph. L. & E.) Bruised nutmegs, 2½ oz.; proof spirit, 1 gal.; water, 1 pint, or q. s.; distil a gallon. Cordial and carminative.—*Dose.* 1 to 4 fl. drs.; chiefly used to flavour mixtures and draughts.

2. (ESSENTIA MYRISTICÆ MOSCHATÆ—Ph. D.) Oil of nutmegs, 1 fl. oz.; rectified spirit, 9 fl. oz. *Used* in dispensing.

3. (B. P.) Volatile oil of nutmeg, 1; rectified spirit, 49; dissolve.—*Dose.* 30 to 60 minims.

Spirit of Pennyroyal. *Syn.* SPIRITUS PULEGII (Ph. L.), S. MENTHÆ PULEGII, L. *Prep.* 1. (Ph. L.) Oil of pennyroyal, 3 fl. drs.; proof spirit, 1 gall.; dissolve. Stimulant, antispasmodic, and carminative.—*Dose.* ½ to 2 fl. drs.

2. (ESSENTIA MENTHÆ PULEGII—Ph. D.) Oil of pennyroyal, 1 fl. oz.; rectified spirit, 9 fl. oz. *Used* chiefly in dispensing.

Spirit of Peppermint. *Syn.* SPIRITUS MENTHÆ PIPERITÆ (B. P., Ph. L.), S. MENTHÆ (Ph. E.), L. *Prep.* 1. (Ph. L.) Oil of peppermint, 3 fl. drs.; proof spirit, 1 gal.; dissolve.

2. (Ph. E.) Green peppermint, 1½ lb.; proof spirit, 7 pints; macerate 2 days; add of water, q. s., and distil 7 pints.—*Dose.* ½ to 2 drs.

3. (ESSENTIA MENTHÆ PIPERITÆ—Ph. D.) Oil of peppermint, 1 fl. oz.; rectified spirit, 9 fl. oz. See ESSENCE OF PEPPERMINT.

4. (B. P.) English oil of peppermint, 1; rectified spirit, 49; dissolve.—*Dose.* 30 to 60

minims, or, for children under five years, 1 to 3 minims.

Spirit of Pimento. *Syn.* SPIRIT OF ALLSPICE; SPIRITUS PIMENTÆ—Ph. L. & E.), L. *Prep.* 1. (Ph. L.) Oil of pimento, 2 fl. drs.; proof spirit, 1 gal.; dissolve.

2. (Ph. E.) From pimento, bruised, ½ lb., and proof spirit, 7 pints; as spirit of caraway. Carminative and stomachic.—*Dose.* 1 to 4 fl. drs.; in flatulent colic, dyspepsia, &c.

3. (ESSENTIA PIMENTÆ—Ph. D.) Oil of pimento, 1 fl. oz.; rectified spirit, 9 fl. oz. *Used* to make pimento water, and in dispensing.

Spirit of Pine-tops. *Syn.* SPIRITUS TURIONUM PINI, L. See RIGA BALSAM.

Spirit of Rosemary. *Syn.* SPIRITUS ROSMARINI (B. P., Ph. L. & E.), L. *Prep.* 1. (Ph. L.) As SPIRIT OF PIMENTO.

2. (Ph. E.) Rosemary tops, 2½ lbs.; rectified spirit, 1 gall.; as SPIRIT OF LAVENDER. Fragrant and stimulant.

3. (ESSENTIA ROSMARINI—Ph. D.) As ESSENCE OF PIMENTO.

4. (B. P.) Oil of rosemary, 1; rectified spirit, 49; dissolve.—*Dose.* 10 to 30 minims.

Spirit of Spear-mint. *Syn.* SPIRITUS MENTHÆ VIRIDIS (Ph. L.), S. MENTHÆ SATIVÆ, L. *Prep.* 1. (Ph. L.) As SPIRIT OF PEPPERMINT—Ph. L.

2. (ESSENTIA MENTHÆ VIRIDIS—Ph. D.) As ESSENCE OF PEPPERMINT—Ph. D. The uses and doses are also the same.

Spirit of Sulphuric Ether. See page 1072.

Spirit of Vitriol (Sweet). See AROMATIC SPIRIT OF ETHER (*above*).

Vulnery Spirit. *Syn.* VULNERARY WATER, ARQUEBUSADE; SPIRITUS VULNERARIUS, L.; EAU D'ARQUEBUSADE, Fr. *Prep.* 1. Dried tops of sage, wormwood, fennel, hyssop, majoram, savory, thyme, rosemary, calamint, balm, peppermint, and scordium, fresh leaves of angelica and basil, and lavender flowers, of each, 4 oz.; proof spirit, 2 galls.; digest for 14 days, and distil over 1½ gal.

2. Rosemary leaves, 1½ lb.; leaves of thyme and summits of millefoil, of each, ½ lb.; juniper berries, 3 oz.; proof spirit, 2 galls.; distil over 5 quarts.

Obs. This preparation is stimulant and vulnerary, and is in great repute on the Continent as a cosmetic and cordial.

SPIRITS (Perfumed). *Syn.* SPIRITUS ODORIFERI, ODORES SPIRITUOSI, L. The odoriferous spirits of the perfumer are, for the most part, prepared from various aromatic and odorous substances, by a similar process to that described under ESSENCES and SPIRITS (Medicinal); but in this case a perfectly pure, flavourless, and scentless spirit must be employed. The distillation should also be preferably conducted by steam, or the heat of a water bath, and the distilled spirit should be kept for some time in a cellar, or other cold situation, previously to being used. When simple solution of an essential oil in the spirit is adopted,

care should be taken that the oil is pale and new; or, at least, has not been much exposed to the air; as in that case it would contain resin, which would make the perfumed spirit, or essence, liable to stain delicate articles of clothing to which it may be applied. Most of the 'eaux' and 'esprits' of the perfumers are prepared by one or other of the above methods. It is found, however, that the perfumed spirits of some of the more delicate flowers cannot be well obtained by either infusion or distillation, or by the simple solution of their essential oils in spirit; or, at least, they are not usually so prepared by the foreign perfumers. The spirits of orange flowers, jasmine, tuberose, jonquille, roses, and of some other flowers, and of cassia, vanilla, &c., are commonly prepared by digesting pure rectified spirit for 3 or 4 days on half its weight of the respective pommades or oils, obtained by infusion or contact. The operation is performed in a closed vessel placed in a water bath, and frequent agitation is employed for 3 or 4 days, when the perfumed spirit is decanted into a second digester, containing a like quantity of oil to the first. The whole process is repeated a second and a third time, after which the spirit is allowed to settle and is then decanted. It now forms the most fragrant and perfect odoriferous spirit (extrait) of the Continental perfumer. The product is called 'esprit' or 'extrait of the first infusion.' The three portions of oil are then treated again with fresh spirit in the same manner, and thus spirits or essences of inferior quality are obtained, which are distinguished by the perfumers as No. 2, 3, 4, &c., or 'esprits' or 'extraits of the first, second, third, &c.,' operation or infusion. In some, though only a very few cases, the spirits are afterwards distilled.

The strength of the spirit for the concentrated essences should not be less than 56 o. p. (sp. gr. .8376); that for eaux, esprits, and extraits, not less than 35 o. p. (sp. gr. .8723). The strength of the second quality of the last three must be fully proof (sp. gr. .920). See ALCOHOL, DISTILLATION, ESSENCE, OILS, POMMADE, &c. and *below*.

Eau d'Ambre Royale. [Fr.] From essences of ambergris and musk, of each, 1 fl. oz.; spirit of ambrette and orange-flower water, of each, 1 pint; rectified spirit, 1 quart; mix.

Eau d'Ange. [Fr.] From flowering tops of myrtle (bruised), 1½ lb.; rectified spirit, 7 pints; water, 3 pints; digest a week, add of common salt, 2 lbs., and distil 1 gal.

Eau d'Argemone. [Fr.] See page 2071.

Eau de Bouquet. [Fr.] From spirits of rosemary and essence of violets, of each, 1 fl. oz.; essences of bergamot and jasmine, of each 1 fl. dr.; oils of verbena and lavender, of each, ½ fl. dr.; orange-flower water, 1 fl. oz.; eau de rose, ½ pint; rectified spirit, 1 quart; mix.

Eau de Bouquet de Flora. [Fr.] From spirits of rosemary and roses and essence of

violets, of each, ½ fl. oz.; oil of cedra and essence of ambergris, of each, 1 fl. dr.; orange-flower water, 5 fl. oz.; rectified spirit, 1 pint.

Eau des Carmes. [Fr.] See SPIRIT OF BALM.

Eau de Cologne. [Fr.] *Syn.* COLOGNE WATER; AQUA COLONIENSIS, A. C. SPIRITUOSA, SPIRITUS COLONIENSIS, L. For the production of good eau de Cologne it is absolutely essential that the spirit be of the purest description, both tasteless and scentless, and that the oils be not only genuine, but recently distilled, as old oils are less odorous, and contain a considerable quantity of resin and camphor, which prove injurious. When flowers and the flowering tops of plants are ordered, it is also necessary that they be either fresh gathered or well preserved, without drying them. To produce an article of the finest quality, distillation should be had recourse to. A very excellent eau de Cologne may, however, be produced by simple solution of the oils or essences in the spirit, provided they be new, pale coloured, and pure. The mass of the eau de Cologne prepared in England, some of which possess the most delicate fragrance, and is nearly equal to the best imported, is made without distillation. In the shops two kinds of this article are generally kept—French and German. That prepared by Farina of Cologne is esteemed the best, and is preferred in the fashionable world.

Prep. 1. From essences of bergamot and lemon, of each, 1 fl. dr.; oil of orange, ½ dr.; oil of neroli, 20 drops; oil of rosemary, 10 drops; essence of ambergris and musk, of each, 1 drop; rectified spirit, ½ pint; mix.

2. Essence of bergamot, 3 fl. oz.; essence of lemon, 3 fl. drs.; essence of cedrat, 2 fl. drs.; oils of neroli and rosemary, of each, 1½ fl. dr.; oil of balm, ½ fl. dr.; rectified spirit, 1½ gal.; mix.

3. (Cadet Gassicourt.) Take of pure neroli, essences (oils) of cedrat, orange, lemon, bergamot, and rosemary, of each, 24 drops; lesser cardamom seeds, ¼ oz.; spirit at 32° Beaumé (sp. gr. .869), 1 quart; digest a few days, and then distil 1½ pint.

4. (Farina.) Take of rectified spirit, 5 galls.; calamus aromaticus, sage, and thyme, of each, ½ dr.; balm-mint and spearmint, of each, 1 oz.; angelica root, 10 grs.; camphor, 15 grs.; petals of roses and violets, of each, 3 drs.; lavender flowers, 1½ dr.; orange flowers, 1 dr.; wormwood, nutmeg, cloves, cassia lignea, and mace, of each, 20 grs.; oranges and lemons, sliced, of each, 2 in no.; bruise or slice the solids, macerate, with agitation, for 48 hours, then distil off 2-3rds, and add to the product—essences of lemon, cedrat, balm-mint, and lavender, of each, 1 fl. dr.; pure neroli and essence of the seeds of anthos, of each, 20 drops; essences of jasmine and bergamot, of each, 1 fl. oz.; mix well and filter, if necessary.

5. (P. Cod.) Oils of bergamot, lemon, and cedrat, of each, 3 oz.; oils of rosemary, laven-

der, and neroli, of each, 1½ oz.; oil of cinnamon, ¾ oz.; spirit of rosemary, 1 quart; compound spirit of balm (eau de melisse des Carmes), 3 pints; rectified spirit, 3 galls.; digest for 8 days, then distil 3 galls.

6. (Dr. A. T. Thomson.) Oils of bergamot, orange, and rosemary, of each, 1 fl. dr.; cardamom seeds, 1 dr.; rectified spirit and orange-flower water, of each, 1 pint; mix, digest for a day, and then distil a pint.

7. (Trommsdorff.) Oils of neroli, citron, bergamot, orange, and rosemary, of each, 12 drops; Malabar cardamoms, bruised, 1 dr.; rectified spirit of wine, 1 quart; mix, and, after standing 2 or 3 days, distil a quart.

Obs. Eau de Cologne is principally used as a perfume, but a very large quantity is consumed by fashionable ladies, as a cordial and stimulant. For this purpose it is dulcified with sugar. A piece of linen dipped in Cologne water, and laid across the forehead, is a fashionable remedy for headache.

Eau d'Elégance. [Fr.] From spirit of jessamine, 1 pint; rectified spirit and spirits of hyacinth and storax, of each, ½ pint; tinctures of star-anise and tolu, of each, 2 fl. oz.; tincture of vanilla, 1 fl. oz.; essence of ambergris, ½ dr.; mix, and in a week decant the clear portion.

Eau de Framboises. [Fr.] From strawberries, bruised, 16 lbs.; rectified spirit, 1 gal.; digest, and distil to dryness in a salt-water or steam bath.

Eau d'Heliotrope. [Fr.] From essence of ambergris, ½ fl. dr.; vanilla, ½ oz.; orange-flower water, ½ pint; rectified spirit, 1 quart; digest a week, and filter.

Eau d'Hongrie. [Fr.] *Syn.* HUNGARY WATER; AQUA HUNGARICA, SPIRITUS ROSMARINI COMPOSITUS, L.; EAU DE LA REINE D'HONGRIE, Fr. A fragrant stimulant and cosmetic. Sweetened with sugar, it is also used as a liqueur.

Prep. 1. Rosemary tops, in blossom, 4 lbs.; fresh sage, ½ lb.; bruised ginger, 2 oz.; rectified spirit, 1½ gal.; water, ½ gal.; macerate for 10 days, add of common salt, 3 lbs., and then distil 11 pints.

2. From oil of rosemary (genuine), 1½ fl. dr.; oil of lavender, ½ dr.; orange-flower water, ½ pint; rectified spirit, 1½ pint; mix. SPIRIT OF ROSEMARY (see *above*) is now commonly sold for it.

Eau d'Isbahan. [Fr.] From ¼ of the bitter orange, 2 fl. oz.; oil of rosemary, 2 drs.; oils of cloves and neroli, of each, 1 fl. dr.; oil of spearmint, ½ fl. dr.; eau de rose, 1 pint; rectified spirit, 7 pints; mix. It is better for distillation. Used as Eau de Cologne.

Eau de Jasmin. [Fr.] See ESPRIT DE JASMIN (*below*).

Eau de Lavande. [Fr.] *Syn.* LAVENDER WATER, DOUBLE DISTILLED L. W.; AQUA LAVANDULÆ, A. L. ODORIFERA, SPIRITUS L., L. *Prep.* 1. From the flowering tops of lavender (freshly and carefully picked), 7 lbs.; rectified spirit, 2 galls.; macerate for a week, add of

water, ½ gal.; (holding in solution) common salt, 3 lbs., and distil 2 gallons.

2. From Mitcham oil of lavender, 8 oz.; essence of musk, 4 oz.; essence of ambergris and oil of bergamot, of each, 1½ oz.; rectified spirit, 2 gallons; mix well. Very fine.

3. (Brande.) Oil of lavender, 20 oz.; oil of bergamot, 5 oz.; essence of ambergris (finest), ½ oz.; rectified spirit, 5 galls.; mix.

Obs. The products of the last two formulæ are better for distillation; but in that case the essences of ambergris and musk should be added to the distilled spirit. The oils should be of the best quality, and newly distilled, and the spirit should be perfectly scentless.

It may be useful to observe here, that the common lavender water, double distilled lavender water, or spirit of lavender of the shops, is made with spirit at proof, or even weaker; hence its inferior quality to that of the more celebrated perfumers. 1 oz. of true English oil of lavender is all that will properly combine with 1 gal. of proof spirit, without rendering it muddy or cloudy.

Eau de lavande is a most agreeable and fashionable perfume. The article produced by the second formula, has received the commendation of her Majesty and many of the nobility.

Eau de Lavange (Ammoniacal). 1. To lavender water, 1 pint, add of liquor of ammonia, ½ fl. oz.

2. (P. Cod.) English oil of lavender, 1 oz.; spirit of ammonia, 2 lbs.; dissolve. Used as a stimulating scent in fainting. See PERFUMES (Ammoniated).

Eau de Lavande de Millefleurs. To each quart of the ordinary eau de lavender (Nos. 2, or 3), add of oil of cloves, 1½ fl. dr.; essence of ambergris, ½ fl. dr.

Eau de Luce. [Fr.] See TINCTURE OF AMMONIA.

Eau de Maréchale. [Fr.] *Syn.* EXTRAIT DE MARÉCHALE, Fr. 1. From ambergris and grain musk, of each, 20 grs.; oils of bergamot, lavender, and cloves, of each, 1 oz.; oils of saffras and origanum, of each, ½ fl. dr.; rectified spirit, 2 quarts; macerate with agitation for a week.

2. Rectified spirit, 1 pint; essence of violets, 1 oz.; essences of bergamot and caillets, of each, ¼ oz.; orange-flower water, ½ pint; mix.

Eau de Melisse. [Fr.] See SPIRIT OF BALM.

Eau de Miel. [Fr.] *Syn.* HONEY WATER, SWEET-SCENTED H. W.; AQUA MELLIS, A. M. ODORIFERA, L. *Prep.* 1. Take of spirit of roses (No. 3—see *above*), 2 quarts; spirit of jasmin and rectified spirit, of each, 1 quart; essence of Portugal, 1 fl. oz.; essences of vanilla and musk, of each (No. 3), 4 fl. oz.; flowers of benzoin, 1½ dr.; mix, agitate, and add of eau de fleurs d'oranges, 1 quart. Delightfully fragrant.

2. Honey (finest), ½ lb.; essence of bergamot;

$\frac{1}{2}$ oz.; essence of lemon, $\frac{1}{4}$ oz.; oil of cloves, 12 drops; musk, 12 grs.; ambergris, 6 grs.; orange-flower and rose water, of each, 1 quart; rectified spirit, 1 gal.; macerate for 14 days, with frequent agitation, and filter.

Obs. The last is often coloured with 20 or 30 grs. of saffron, and made into a ratafia with sugar. HONEY WATER FOR THE HAIR is a different article to the above. It is obtained by the dry distillation of honey, mixed with an equal weight of clean sand, a gentle heat only being employed. The product is yellowish, and acidulous, from the presence of acetic acid. This last is used to promote the growth of the hair.

Eau de Millefleurs. [Fr.] *Syn.* EXTRAIT DE MILLEFLEURS, Fr. *Prep.* 1. From grain musk, 12 grs.; ambergris, 20 grs.; essence of lemon, $1\frac{1}{2}$ oz.; oils of cloves and lavender (English), of each, 1 oz.; neroli and oil of verbenia, of each, $\frac{1}{2}$ dr.; rectified spirits, 2 quarts; macerate in a closed vessel, and a warm situation, for a fortnight.

2. Balsam of Peru (genuine) and essence of cloves, of each, 1 oz.; essences of bergamot and musk, of each, 2 oz.; essences of neroli and thyme, of each, $\frac{1}{4}$ oz.; eau de fleurs d'oranges, 1 quart; rectified spirit, 9 pints; mix well. Very fine.

3. Essence of bergamot, $\frac{1}{4}$ oz.; eau de havande and essence of jasmine, of each, 1 oz.; orange-flower water, 8 fl. oz.; rectified spirit, 1 pint; mix.

Eau de Mousselline. [Fr.] From eau de fleurs d'oranges and spirit of clove-gillyflower, of each, 1 quart; spirit of roses (No. 3—see above), spirit of jasmine (No. 4), and spirit of orange flowers (No. 4), of each, 2 quarts; essences of vanilla and musk, of each (No. 3), 2 fl. oz.; sanders wood, $\frac{1}{2}$ oz. Very fine.

Eau de Naphe. [Fr.] See WATERS (Perfumed).

Eau Romain. [Fr.] From essence of ambergris, 1 fl. oz.; tincture of benzoin, 4 fl. oz.; spirit of tuberose, $\frac{1}{2}$ pint; spirit of acacia flowers and tincture of vanilla, of each, 1 pint; spirit of jasmine, 3 pints; mix.

Eau de Rosieres. [Fr.] From spirit of roses, 1 pint; spirits of cucumber, angelica root, and celery seeds, of each, $\frac{1}{2}$ pint; spirits of jasmine and orange flowers, of each, $\frac{1}{2}$ pint; tincture of benzoin, 2 fl. oz.; mix.

Eau sans Pareille. [Fr.] 1. From essence of bergamot, 5 drs.; essence of lemon, 8 drs.; essence of citron, 4 drs.; Hungary water, 1 pint; rectified spirit, 6 quarts; mix, and distil.

2. Grain musk, 20 grs.; ambergris, 25 grs.; oils of lavender and cloves, of each, 1 oz.; essence of bergamot, $\frac{1}{2}$ oz.; oils of sassafras and origanum, of each, 20 drops; rectified spirit, 1 gal.; macerate for 14 days.

Eau de Violette. [Fr.] See ESPRIT DE VIOLETTES (below).

Esprit d'Ambrette. [Fr.] See ESSENCE (page 456).

Esprit de Bergamotte. [Fr.] From essence (oil) of bergamot (best), 5 oz.; essence of ambergris (pale), 2 fl. oz.; essence of musk, $\frac{1}{2}$ fl. oz.; oil of verbenia, 2 fl. drs.; rectified spirit, 1 gal.; mix.

Esprit de Bouquet. [Fr.] From Mitcham oil of lavender, 1 oz.; oils of cloves and bergamot, of each, 3 fl. drs.; essence of musk, 1 fl. dr.; otto of roses, 10 drops; rectified spirit, 1 quart.

Esprit de Fleurs. [Fr.] See SPIRIT OF THE FLOWERS OF ITALY (below).

Esprit de Jasmin. [Fr.] *Syn.* EAU DE JASMIN, Fr. See page 1073.

Esprit de Jasmin Odorante. [Fr.] From spirit of jasmine and rectified spirit, of each, 1 pint; essence of ambergris, 1 fl. dr.

Esprit de Jonquille. [Fr.]

Esprit de la Reine. [Fr.] From oil of bergamot, 1 fl. oz.; essence of ambergris, 2 fl. drs.; otto of roses, 1 fl. dr.; rectified spirit, 1 quart.

Esprit de Rondeletia. [Fr.] *Syn.* EXTRAIT DE RONDELETTA, Fr. From Mitcham oil of lavender, 3 oz.; oil of cloves, $1\frac{1}{2}$ oz.; oil of bergamot, 1 oz.; essences of musk and ambergris, of each, 2 fl. drs.; rectified spirit, 3 pints.

Esprit de Rose. [Fr.] 1. From spirit of roses (see general directions, page 1073), 1 pint; essence of ambergris and oil of rose-geranium, of each, $\frac{1}{2}$ fl. dr.

2. From otto of roses, 2 drs.; neroli, $\frac{1}{2}$ dr.; rectified spirit, 1 gal.; dissolve, add of chloride of calcium (well dried and in powder), $1\frac{1}{2}$ lb.; agitate well, and distil 7 pints. Very fine.

Esprit de Suave. [Fr.] From the essences of cloves and bergamot, of each, $1\frac{1}{2}$ fl. dr.; neroli, $\frac{1}{2}$ fl. dr.; essence of musk, 1 fl. oz.; spirit of tuberose and rectified spirit, of each, 1 pint; spirits of jasmine and cassia, of each, 1 quart; dissolve, then add of eau de rose, 1 pint, and mix well.

Esprit de Tain. [Fr.] *Syn.* SPIRIT OF LEMON THYME; SPIRITUS THYMI, L. From tops of lemon thyme, 2 lbs.; proof spirit, 1 gal.; distil 7 pints.

Esprit de Violettes. [Fr.] *Syn.* SPIRIT OF VIOLETS, ESSENCE OF V., E. OF ORRIS. From Florentine orris root, reduced to coarse powder, $\frac{1}{2}$ lb.; rectified spirit, 1 pint; by simple maceration for a fortnight. A stronger and finer article (ESSENCE OF VIOLETS) is prepared from orris root, 5 lbs., to rectified spirit, 1 gal.; by percolation.

Extrait de Bouquet. [Fr.] Extract of nougay.

Extrait de Maréchale. [Fr.] See page 1075.

Extrait de Millefleurs. [Fr.] See above.

Extrait de Rondeletia. [Fr.] See above.

Odeur Délectable. [Fr.] From oils of lavender, bergamot, rose-geranium, and cloves, of each 1 fl. dr.; eaux de rose and fleurs d'orange, of each, $\frac{1}{2}$ pint; rectified spirit, $1\frac{1}{2}$ pint.

Odeur Suave. [Fr.] See *ESPRIT (above)*.

Spirit of Cytherea. From the spirits of violets, tuberose, clove-gillyflower, jasmin (No. 2—see *above*), roses (No. 2), and Portugal, of each, 1 pint; orange-flower water, 1 quart; mix.

Spirit of the Flowers of Italy. *Syn.* *ESPRIT DE FLEURS*, Fr. From the spirits of roses (No. 1—see *above*), jasmin (No. 2), oranges (No. 3), and cassia (No. 2), of each, 4 pints; orange-flower water, 3 pints; mix.

Victoria Perfume. See *ESPRIT DE LA REINE (above)*.

SPITTING OF BLOOD. See *HÆMOPTYSIS*.

SPONGE. *Syn.* *SPONGIA*, *S. OFFICINALIS*, L. Sponge is a cellular fibrous structure, produced by marine animals of the humblest type, belonging to the sub-kingdom Protozoa. The finest quality is imported from Smyrna, and is known as *TURKEY SPONGE*; another, called *WEST INDIAN* or *BAHAMA SPONGE*, is much less esteemed, being coarse, dark coloured, and very rotten.

Sponge, as collected, and also as generally imported, contains many impurities, more especially sand, most of which may be removed by beating it, and by washing it in water. Amusing disputes often arise between the smaller importers and the wholesale purchasers, on this subject—the privilege of beating it before weighing it, the number of minutes so employed, and even the size of the stick, being often made important matters in the ‘haggling.’

BLEACHED SPONGE (WHITE SPONGE; SPONGIA DEALBATA) is prepared by soaking ordinary sponge in very dilute hydrochloric acid, to remove calcareous matter, then in cold water, changing it frequently, and squeezing the sponge out each time, and next, in water holding a little sulphuric or sulphurous acid, or, still better, a very little chlorine, in solution; the sponge is, lastly, repeatedly washed and soaked in clean water, scented with rose or orange-flower water, and dried.

BURNT SPONGE (SPONGIA USTA—Ph. D.) is prepared by heating the cuttings and unsaleable pieces in a closed iron crucible until they become black and friable, avoiding too much heat, and allowing the whole to cool before exposing it to the air. It was formerly in great repute in bronchocoele and scrofulous complaints.—*Dose.* 1 to 3 drs., in water, or made into an electuary or lozenges.—When good, burnt sponge evolves violet fumes of iodine on being heated in a flask along with sulphuric acid.

COMPRESSED or WAXED SPONGE (SPONGIA CERATA, S. COMPRESSA) is sponge which has been dipped into melted wax, and then compressed between two iron plates until cold. When cut into pieces it forms ‘*SPONGE TENTS*,’ which are used by surgeons to dilate wounds.

SPOTS and STAINS.—1. **OIL and GREASE**

SPOTS on boards, marble, &c., when recent, may be removed by covering them with a paste made of fuller’s earth and hot water, and the next day, when the mixture has become perfectly dry, scouring it off with hot soap-and-water. For old spots, a mixture of fuller’s earth and soft soap, or a paste made of fresh-slaked lime and pearlash, will be better; observing not to touch the last with the fingers.

2. **RECENT SPOTS of OIL, GREASE, or WAX**, on woollen cloth or silk, may be removed with a little clean oil of turpentine or benzol; or with a little fuller’s earth or scraped French chalk, made into a paste with water, and allowed to dry on them. They may also be generally removed by means of a rather hot flat-iron and blotting-paper or spongy brown paper, more especially if the cloth, or one of the pieces of paper, be first slightly damped. **OLD OIL and GREASE SPOTS** require to be treated with ox-gall or yolk of egg, made into a paste with fuller’s earth or soap. **PAINT SPOTS**, when recent, generally yield to the last treatment. Old ones, however, are more obstinate, and require some fuller’s earth and soft soap made into a paste with either ox-gall or spirit of turpentine.

FRUIT and WINE STAINS, on linen, commonly yield easily to hot soap-and-water. If not, they must be treated as those below.

INK SPOTS and RECENT IRON MOULDS on washable fabrics may be removed by dropping on the part a little melted tallow from a common candle, before washing the articles; or, by the application of a little lemon juice, or of a little powdered cream of tartar made into a paste with hot water. Old ink spots and iron moulds will be found to yield almost immediately to a very little powdered oxalic acid, which must be well rubbed upon the spot previously moistened with boiling water, and kept hot over a basin filled with the same.

STAINS arising from ALKALIES and ALKALINE LIQUORS, when the colours are not destroyed, give way before the application of a little lemon juice; whilst those arising from the weaker acids and acidulous liquids yield to the fumes of ammonia, or the application of a little spirit of hartshorn or sal volatile.

STAINS OF MARKING INK may be removed by soaking the part in a solution of chloride of lime, and afterwards rinsing it in a little solution of ammonia or of hyposulphate of soda; or they may be rubbed with the tincture of iodine, and then rinsed as before. See **BAKES, CLOTHES, HANDS, SCOURING, STAINS, &c.**

SPRAIN. *Syn.* *SUBLUXATIO*, L. An injury of a joint, in which it has been strained or twisted in an unnatural manner, without actual dislocation. Pain, swelling, and inflammation, are the common consequences, which must be combated by purgatives, repose, and a low diet, with refrigerant lotions, or

warm fomentations, according to circumstances. In extreme cases, blood should be taken. Where there is simple stiffness and weakness, exercise is often serviceable.

SPRAT. The *Clupea Sprattus* (Linn.), a small fish of the herring family, abounding on our coasts. Gutted, coloured, and pickled, it is sold for anchovies, or as British anchovies, and much used to make the sauce of that name.

SPRUCE. See BEER, ESSENCE, and POWDERS.

SPUNK. See AMADOU.

SQUILL. *Syn.* *SCILLA* (B. P., Ph. L. E. & D.), L. The bulb of "*Urginea Scilla*," sliced and dried. In small doses, squill acts as a stimulating expectorant and diuretic; in larger ones, as an emetic and purgative. With the first intention it is generally given in substance (powder), in doses of 1 to 3 or 4 grs.; with the latter, either made into vinegar or oxymel (which see). It is an excellent remedy in coughs, &c., after the inflammatory symptoms have subsided.

STAINED GLASS. The art of painting or staining glass resembles enamel painting, in the effect being produced by fluxing certain metallic substances, as oxides or chlorides, on its surface, by means of heat applied in a suitable furnace. The operations it embraces are difficult, and require great promptitude and experience to prove successful. The colours or compounds employed are, for the most part, similar to those noticed under ENAMEL and PASTE.

STAINS. Discolourations from foreign matters. Liquid dyes are also frequently termed 'stains.' See SPOTS, &c., and below.

Stains, Blood. Spots of dried blood on wood, linen, &c., however old, are easily recognised by the microscope; but simple stains or marks of blood of a slight character, especially those occurring on iron or steel, are recognised with greater difficulty. To obviate this, H. Zollikofer adopts the following plan:—The spot is removed, by scraping, from the surface of the metal, and the resulting powder is digested in tepid water, when a liquid is obtained which exhibits the following reactions:—

1. The liquid is neutralised with acid, and heated to ebullition, when opalisation occurs, or a dirty red coagulum forms.

2. The coagulum is dissolved in hot liquor of potassa; the solution, if blood (hæmatin) be present, is diachromatic, or appears green by transmitted light and red by reflected light.

3. By the addition of concentrated chlorine water, in excess, to either solution, white flocks of albumen and chlorhæmatin separate, which are free from iron, as tested by sulphocyanide of potassium.

Obs. The last two reactions are said to be characteristic. Very old spots must be boiled in water containing a little liquor of

potassa. See Dr. Taylor's 'Medical Jurisprudence.'

Stains, Bookbinder's. See LEATHER, MARBLING, &c.

Stains, Confectioner's. These are similar to those noticed under LIQUEUR. Mineral colours, especially mineral blues, greens, and yellows, must on no account be used, as they are nearly all dangerous poisons; nor is there any inducement to use them, since the vegetable substances referred to afford, by proper management, every shade that can be possibly required. These stains are also used for cakes and pastry.

Stains, Liqueur. See LIQUEUR.

Stains, Map. See MAPS, VELVET COLOURS, &c.

STAMMERING. *Syn.* *BLESITAS*, L. Occasionally, this depends on some organic affection, or slight malformation of the parts of the mouth or throat immediately connected with the utterance of vocal sounds; but, much more frequently, it is a habit resulting from carelessness, or acquired from example or imitation. When the latter is the case, it may be generally removed by perseveringly adopting the plan of never speaking without having the chest moderately filled with air, and then only slowly and deliberately. Hasty and rapid speaking must not be attempted until the habit of stammering is completely subdued. Nervous excitement and confusion must be avoided as much as possible, and the general health attended to, as circumstances may direct. This variety of stammering is commonly distinguished by the person being able to sing without hesitation. Stammering, depending on elongation of the uvula, and other like causes, may be generally removed by a simple surgical operation.

STANNIC ACID. Peroxide of tin.

STARCH. $C_6H_{10}O_5$. *Syn.* *AMYLAÇEOUS FECULA*; *AMYLUM*, L. One of the most important and widely diffused of the proximate principles of vegetables, being found, in greater or less quantity, in every plant. The mealy and farinaceous seeds, fruits, roots, and the stem-pith of certain trees, consist chiefly of starch in a nearly pure state. Wheat contains about 75% and potatoes about 15% of this substance. From these sources the fecula is obtained by rasping or grinding to pulp the vegetable structure, and washing the mass upon a sieve, by which the torn cellular tissue is retained, whilst the starch passes through with the liquid, and eventually settles down from the latter as a soft, white, insoluble powder, which, after being thoroughly washed with cold water, is dried in the air, or with a very gentle heat.

WHEAT STARCH (*AMYLUM*, B. P., Ph. L. E. & D.) is commonly prepared by steeping the flour in water for a week, or a fortnight, during which time the saccharine portion ferments and the starch-granules become freed, for the most part, from the glutinous matter which

envelopes them, by the disintegrating and solvent action of the lactic acid generated by the fermentation. The sour liquor is then drawn off, and the feculous residue washed on a sieve; what passes through is allowed to settle, when the liquid is again drawn off, and the starch thoroughly washed from the slimy matter; it is then drained in perforated boxes, cut up into square lumps, placed on porous bricks to absorb the moisture, and, lastly, air or stove dried.

In the preparation of starch from potatoes (potato starch) and other like vegetable substances, the roots or tubers, after being washed and peeled, either by hand-labour or by machinery, are rasped by a revolving grater, and the pulp washed on hair sieves until freed from feculous matter. Successive portions of the pulp are thus treated until the vessel over which the sieves are placed, or into which the washings run, is sufficiently full. The starch held in suspension in the water having subsided to the bottom, the water is drawn off, and the starch stirred up with fresh water, and again allowed to subside. This operation is repeated several times, with fresh water, until the starch is rendered sufficiently pure for commercial purposes, when it is washed and dried as before. The waste fibres and the washing waters are used as manure. (See *Arrow-root*.)

In the manufacture of starch from rice and Indian corn (rice starch, maize starch), a very dilute solution of caustic soda, containing about 200 grs. of alkali to each gallon of liquid, is employed to facilitate the disintegration and separation of the gluten and other nitrogenised matters. A weak solution of ammonia, or sesquicarbonate of ammonia, is also similarly employed with advantage. The gluten may be recovered by saturating the alkali with dilute sulphuric acid. Such starch does not require boiling, and is less apt than wheat starch to attract moisture from the atmosphere. Most of the so-called 'wheaten starch' of commerce used by laundresses is now prepared from rice.

To whiten the starches made from damaged roots and grains, and the coarser portions of those from sound ones, a little solution of chloride of lime is occasionally added to the water, followed by another water containing a very little dilute sulphuric acid; every trace of the last being afterwards removed by the copious use of pure soft or spring water.

The bluish-white starch used by laundresses is coloured with a mixture of smalts and alum in water, and is regarded as unfit for medicinal purposes.

Prop., &c. Starch is insoluble in cold water, and in alcohol and most other liquids, but it readily forms a gelatinous compound (amidin) with water at about 175° Fahr.; alcohol and most of the astringent salts precipitate it from its solutions; infusion of galls throws down a copious yellowish precipitate, con-

taining tannic acid, which is redissolved by heating the liquid; heat and dilute acids convert it into dextrin and grape sugar; strong alkaline lyes dissolve it, and ultimately decompose it. Sp. gr. 1.53.

To the naked eye it presents the appearance of a soft, white, and often glistening powder; under the microscope it is seen to be altogether destitute of crystalline structure, but to possess, on the contrary, a kind of organisation, being made of multitudes of little rounded transparent bodies, upon each of which a series of depressed parallel rings, surrounding a central spot or hilum, may be traced. The starch-granules from different plants vary both in magnitude and form. Those of potato-starch and canna starch (*tous les mois*) are the largest, and those of rice and millet starch the smallest, the dimensions ranging from $\frac{1}{100}$ to the $\frac{1}{1000}$ of an inch. The granules of arrow-root and *tous les mois* are ovoid, those of potato starch both oblong and circular, those of tapioca muller-shaped, and those of wheat starch circular.

Identif. One of the commonest frauds practised upon the profession and the public is the admixture of the cheaper kinds of starch, chiefly potato farina, with arrow-root, and vending manufactured for genuine tapioca, sago, and other articles of diet, used for invalids and children. These sophistications are most easily detected with a good microscope.¹

Starch, Iodide of. *Syn.* AMYLI IODIDUM, AMYLI IODATUM, L. *Prep.* (Ph. Castr. Ruthena.) Iodine, 24 grs.; rectified spir^t a few drops; rub them to a powder; the starch, 1 oz., and again triturate, until the mass assumes a uniform colour. Recommended by Dr. A. Buchanan, of Glasgow, as producing the alterative effects of iodine, without the usual irritant action of that medicine. *Dose.* A teaspoonful, or more, in water-gruel, or any bland liquid, twice or thrice a day.

STARCHING (Clear). Muslins, &c., are 'clear-starched' or 'got-up' by laundresses in the following manner:—Rinse the articles in three waters, dry them, and dip them into thick made-starch, which has been previously strained through a piece of muslin; squeeze them, shake them gently, and again hang them up to dry; when they are dry, dip them twice or thrice into clear water, squeeze them, spread them on a linen cloth, roll them up in it, and let them lie an hour before ironing them. Some persons put a morsel of sugar into the starch, to prevent its sticking whilst ironing, and others stir the starch with a candle to effect the same end; both these practices are as injurious as unnecessary. The best plan to prevent sticking is simply to use the best starch, and to make it well, and to have

¹ The measurements and microscopical appearances of all the commercial starches will be found accurately described and figured in Boyle's "*Manual of Materia Medica*."

the irons quite clean and highly polished. Mr. W. B. Tegetmeier recommends the addition of a small piece of paraffin (a piece of paraffin candle-end) to the starch, to increase the glossiness of the ironed fabric.

STAVESACRE. *Syn.* STAVESACRE SEEDS; STAPHISAGRIÆ SEMINA, STAPHISAGRIA (Ph. L. & D.), L. "The seed of *Delphinium Staphisagria*, Linn." (Ph. L.) This article is powerfully emetic and cathartic, but is now scarcely ever used internally. Mixed with hair powder, it is used to kill lice. An infusion, or ointment, made with it is said to be infallible in itch, but its use requires some caution.

STARS. (In pyrotechny.) *Prop.* 1. (Brilliant—Marsh.) Nitrate, 52½ parts; sulphur and black antimony, of each, 13 parts; reduce them to powder, make them into a stiff paste with isinglass, 1½ part, dissolved in a mixture of vinegar, 6½ parts, and spirits of wine, 13 parts; lastly, form this into small pieces, and, whilst moist, roll them in meal gunpowder.

2. (WHITE—Ruggieri.) Nitre, 16 parts; sulphur, 7 parts; gunpowder, 4 parts; as the last.

3. (GOLDEN RAIN.)—*a.* (Ruggieri.) Nitre and gunpowder, of each, 16 parts; sulphur, 10 parts; charcoal, 4 parts; lampblack, 2 parts; mix, and pack it into small paper tubes.

b. (Ruggieri.) Nitre, 16 parts; sulphur and gunpowder, of each, 8 parts; charcoal and lampblack, of each, 2 parts; as the last.

c. (Marsh.) Mealed gunpowder, 66½ parts; sulphur, 11 parts; charcoal, 22½ parts; as before. Used for the 'garniture' of rockets, &c.

STAYS. *Syn.* CORSET. Stays, "before womanhood, are instruments of barbarity and torture, and then they are needed only to give beauty to the chest. It is the duty of every mother, and every guardian of children, to inquire the purpose for which stays were introduced into female attire. Was it for warmth? If so, they certainly fulfil the intention very badly, and are much inferior to an elastic woollen habit, or one of silk quilted with wool. Was it to force the ribs, while yet soft and pliable, into the place of the liver and stomach, and the two latter into the space allotted for other parts, to engender disease and deformity to the sufferer and her children for generations? Truly, if this were the object, the device is most successful, and the intention most ingeniously fulfilled." (Eras. Wilson.)

"Only observe," exclaimed Dr. John Hunter, "only observe, if the statue of the Medicean Venus were to be dressed in stays, and her beautiful feet compressed into a pair of execrably tight shoes, it would extort a smile from an Heraclitus, and a horse-laugh from a Cynic."

"The Turkish ladies express horror at seeing

Englishwomen so tightly laced." (Lady M. W. Montague.)

The practice of tight-lacing has happily gone out of fashion since the remarks above quoted were made.

STEAM. The application of steam of the laboratory, as a source of heat, is commonly effected by means of double pans, to the space between which steam, at a moderate pressure, is introduced, the arrangements being such as to permit of the condensed steam, or distilled water, being removed, by means of a cock, nearly as soon as formed, or as may be desirable. Another plan is to place coils of metal pipe along the bottom of cisterns, vats, &c., formed either of wood or metal, and to keep them supplied with high-pressure steam.

"It is quite susceptible of positive proof that by no arrangement yet discovered, can more than two thirds of the heat generated by a given quantity of coal, during combustion, be fairly absorbed and utilised in any of our manufactories; and, moreover, there are undeniable facts, which demonstrate that seldom, in the burning of coal, are more than three fourths of the total heat, which might be eliminated, actually obtained; thus justifying the supposition that one half of all the coal now consumed is virtually wasted, and lost to society." To lessen, as much as possible, this loss, various improvements have been made, which, "for the most part, have consisted in lengthening the flues, and exposing a larger surface of the boiler to the action of the heated air passing from the furnace to the chimney." "Remembering that air is an extremely bad conductor of heat, and that water about to be converted into steam is also a bad conductor, it is evident that time must form an important element in the perfect transmission of heat from one of these to the other; and hence, with a great velocity of current existing in the flues, very little heat would pass from air, however high its temperature, to water contained in a boiler, and so circumstanced with respect to its all but gaseous condition." The results of the experiments on fuel made at the Museum of Practical Geology by Sir H. de la Beche and Dr. Lyon Playfair, go clearly to show that, "to open the damper of a steam-boiler furnace is pretty generally to diminish the effective power of the fuel." "Great waste of coal now arises from this simple circumstance; and much of the heat of the fire, which ought to go to the boiler, is lost by its (too) hasty transmission up the chimney. If, however, there be thus far room for improvement in the direction just indicated, still wider is the vacant space, caused by imperfect combustion, or, in technical phrase, 'bad stoking,' merely because the stoker, to economise his labour, and to avoid trouble, throws on to the bars of his furnace a thick layer of fuel, by which loss is caused in two or three directions." These are, principally, imperfect combustion, and the volatili-

sation of fuel, as smoke, &c., from an insufficient supply of air, and from a mass of mere red-hot coke or cinder, two or three inches thick, lying between the boiler and the hottest part of the furnace; which last, according to Dr. Kennedy, is about one inch above the fire-bars. Besides which, "in passing over this red-hot coke, the carbonic acid would be converted into carbonic oxide, and thus not only remove a quantity of carbon equal to its own, without yielding any additional heat, but actually with the production of cold, or, in other words, the absorption of heat." ('Dict. Arts, Manuf., and Mines.') This points to the evident policy of using a smoke-consuming furnace, as noticed elsewhere.

Another matter worthy of remark, is the constant waste of heat, and, consequently, of fuel, in laboratories and manufactories in which steam is employed, owing to the exposed condition of the pipes, boilers, and pans. All of these should be well 'clothed' or covered by some non-conducting medium, to prevent loss of heat by radiation, and by contact with the atmosphere. Not only does economy dictate such a course, but the health and comfort of the workpeople demand that the atmosphere in which they labour should be as little heated and poisoned as possible.

TABLE of corresponding Pressure and Temperatures of Steam. By ARAGO and DULONG.

Pressure in Atmospheres. ¹	Temperature, Fahr.	Pressure in Atmospheres. ¹	Temperature, Fahr.
	Degrees.		Degrees.
1	212°	13	380·66
1½	234°	14	386·94
2	250·5	15	392·86
2½	263·8	16	398·48
3	275·2	17	403·83

9	350·78	40	486·59
10	358·88	45	499·14
11	366·85	50	510·6
12	374°		

A cubic inch of water, during its conversion into steam, under the ordinary pressure of the atmosphere, expands into 1696 cubic inches, or nearly a cubic foot.

One part, by weight, of steam, at 212° Fahr.,

¹ Estimating 14·6 lbs. = 1 atmosphere.

when condensed into cold water, is found to be capable of raising 5·6 parts of the latter from the freezing- to the boiling-point. See FUEL, PIT-COAL, SMOKE, &c.

STEARIC ACID. $\text{HC}_{18}\text{H}_{35}\text{O}_2$. *Syn.* STEARIN (Commercial). This is obtained from stearin (see *below*), by saponification.

Prep. 1. Repeatedly dissolve and crystallise commercial stearic acid in hot alcohol, until its melting-point becomes constant at not less than 158° Fahr. Pure.

2. (Chevreul.) Saponify mutton suet with caustic potassa, and dissolve the newly formed soap in 6 times its weight of hot water; to the solution add 40 or 50 parts of cold water, and set the mixture aside in a temperature of about 52° Fahr.; after a time separate the pearly matter (stearate and margarate of potassa) which falls, drain and wash it on a filter, and dissolve it in 24 parts of hot alcohol of sp. gr. '820; collect the stearate of potassa which falls as the liquid cools, recrystallise it in alcohol, and decompose it, in boiling water, with hydrochloric acid; lastly, wash the disengaged stearic acid in hot water, and dry it.

3. (Commercial.) Ordinary tallow is boiled in large wooden vessels, by means of high-pressure steam, with about 16½ of hydrate of lime (equiv. to 11½ of pure lime), for 3 or 4 hours, or until the combination is complete, and an earthy soap is formed, when the whole is allowed to cool; the product (stearate of lime) is then transferred to another wooden vessel, and decomposed by adding to it 4 parts of oil of vitriol (diluted with water) for every 3 parts of slaked lime-previously employed, the action being promoted by steam heat and brisk agitation; after repose, the liberated fat is decanted from the sediment (sulphate of lime) and water, and is then well washed with water, and by blowing steam into it; it is next allowed to cool, when it is reduced to shavings by means of a number of knives worked by machinery, and in this divided state is placed in canvas bags and submitted to the action of a powerful hydraulic press, by which a large portion of the oleic acid which it contains is expelled; the pressed cakes are then a second time exposed to the action of steam and water, again cooled, and coarsely powdered, and again submitted to the joint action of steam and pressure; they are, lastly, melted, and cast into blocks for sale.

Obs. This product is a more or less impure mixture of stearic acid and other fatty bodies, particularly the so-called margaric acid, now generally regarded as a mixture of palmitic and stearic acids. The hard fatty acids of vegetable origin (palmitic, cocinic, myristic, &c.), now so extensively used as candle materials, are obtained from the natural oils and butters by the process known as 'sulphuric acid saponification,' which consists in treating the fatty bodies with 5 or 6½ of concentrated sulphuric acid at a high temperature, (about 350° Fahr., produced by superheated

steam), and distilling the resulting mass by the aid of steam heated to about 560° Fahr. Frequently the operations of hot and cold pressing are resorted to in order to free the product from the softer fats.

By a patent process employed at Price's candle works the natural vegetable fats are decomposed into their constituents (fatty acids and glycerin) by the action of superheated steam alone, without previous 'saponification,' with lime or sulphuric acid.

Prop., &c. Pure stearic acid crystallises in milk-white needles, which are soluble in ether and in cold alcohol, and form salts with the bases, called stearates. The commercial acid is made into candles. See CANDLES, FAT, OILS (Fixed), and TALLOW.

STEARIN. $C_{37}H_{74}O_6$. The solid portion of fats which is insoluble in cold alcohol.

Prep. Pure strained mutton suet is melted in a glass flask along with 7 or 8 times its weight of ether, and the solution allowed to cool; the soft, pasty, semi-crystalline mass is then transferred to a cloth, and is strongly pressed as rapidly as possible, in order to avoid unnecessary evaporation; the solid portion is then redissolved in ether, and the solution allowed to crystallise, as before. The product is nearly pure.

Prop., &c. White; semi-crystalline; insoluble in water and cold alcohol; soluble in 225 parts of cold ether, and freely so in boiling ether. It melts at 130° Fahr. The stearin of commerce is stearic acid.

STEAROPTEN. The name given by Herberger to the concrete portion or camphor of volatile oils. Bizio calls it stereusin.

STEEL. This important material may be defined as iron chemically combined with sufficient carbon to give it extreme toughness and hardness without brittleness. According to one of our greatest authorities on metallurgy, steel should contain from .833% to 1.67% of carbon, these numbers referring respectively to the softest and the hardest varieties. Within the last few years great attention has been paid to the investigation of the chemistry of steel. The researches of Despretz and Fremy tend to the conclusion that nitrogen exercises a very important influence over the phenomena of 'steeling,' and that carbon plays a less necessary part; while those of Caron and Deville still refer the formation of steel to the chemical combination of iron with carbon. The processes for converting iron into steel, and for 'tempering' steel articles, cannot be described in a work like the present.

There is no test of the value of steel beyond its elasticity and temper, and the fineness, equality, and smoothness of its grain.

STEREOTYPE METAL. See TYPE METAL.

STEELING. The truth of the old proverb, that "All is not gold which glitters," is often

painfully experienced by the purchaser of modern jewelry. The following table will, therefore, prove highly useful to the reader in determining the value of articles in gold, provided he ascertain the 'fineness' of the metal, either by examination or written warranty:—

Sterling value of Gold of different degrees of 'Fineness.'

Carats. Fine.		Value per oz. Troy.
		£ s. d.

STEREO-METAL. A remarkable alloy recently invented by Baron de Rosthorn, of Vienna, and used in place of ordinary gun-metal. It consists of copper and spelter, with small proportions of iron and tin, and to these latter its peculiar hardness, tensile strength, and elasticity, are attributed.

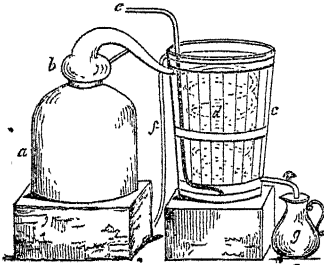

STETHOSCOPE. An instrument employed in auscultation. It consists of a tube (usually made of wood, sometimes of gutta percha) widening considerably at one end, and but slightly at the other. The wide end is applied to the chest or other part of the patient, the physician putting his ear at the other end; and from the sounds emitted by the heart, lungs, &c., the state of these parts is ascertained.

STEWING. A method of cooking food intermediate to frying and boiling, performed by simmering it in a saucepan or stewpan, with merely sufficient water to prevent burning, and to effect the object in view; the whole being served up to form the 'dish.' It is undoubtedly the most simple and economical, and when skilfully conducted, one of those best calculated to develop the flavour and nutritious qualities of animal food. The following is one of the most popular stews:—

¹ For full information respecting the manufacture of steel, refer to Dr. Percy's elaborate treatise on "*Metalurgy—Iron and Steel*."

Stew, Irish. Prep. (Soyer.) Take about 2 lbs. of scrag or neck of mutton; divide it into ten or twelve pieces, and lay them in the pan; add 8 large potatoes and 4 onions cut into slices, season with $1\frac{1}{2}$ teaspoonful of pepper, and 3 do. of salt; cover all with water, put it into a slow oven, or on a stove, for two hours, then stir it all up well, and serve it up in deep dishes. If a little more water is added at the commencement, you can take out, when half done, a nice cup of broth.

STILL. A vessel or apparatus employed for the distillation of liquids on the large scale. The forms of stills, and the materials of which they are made, vary according to the purposes for which they are intended, some being exceedingly simple, whilst others are equally elaborate and complicated. The *engr.* represents the most common and useful apparatus of this kind, and the one almost exclusively employed in the laboratory. It is used as follows:—After the fluid and other matters (if any) are put into the still, the head is placed on and connected with the worm-tub or refrigerator, and the joints are all securely luted. For ordinary liquids, a stiff paste made with linseed meal and water, to which a little chalk may be added, answers well for this purpose. For corrosive liquids, nothing is better than elastic bands or rings interposed between the joints, which are then 'brought home,' as it is called, with screws or clamps. Heat is next applied, and the worm tub is supplied with cold water in sufficient quantity to preserve its contents at a proper temperature; the application of the heat, being so regulated that the liquid may drop from the end of the refrigerator quite cold and unaccompanied with vapour. For highly volatile liquids a closed receiver should be provided.

- a. Body of still, which may be either placed in a steam jacket or in a brick furnace.
- b. Still head or capital.
- c. Worm tub.
- d. Pewter worm, or refrigerator.
- e. Cold water pipe.
- f. Waste pipe.
- g. Receiver.

STIMULANTS. *Syn.* **STIMULANTIA, L.** Medicines or agents which possess the power of exciting vital action. They are divided into general stimulants, or those which affect the whole system, as mercury or bark; and local or topical stimulants, or those which

affect a particular organ or part only, as mustard applied as a poultice. Diffusible stimulants are general stimulants the effects of which are rapid but fugacious, as ether or alcohol. "Much discrimination and caution are required in the administration of articles of this class, because, if given when inflammation is present, they are liable to create more mischief than benefit; but they are called for when, on the decline of that condition of an organ or organs, a state of relaxation or torpidity exists. In this state of things, a gentle stimulation materially assists the functions, and is productive of much benefit."

STIR-ABOUT. Thick gruel formed of oat-meal and water boiled together. When eaten with cold milk, it forms the porridge of the Scotch; and when mixed with the liquor in which meat or vegetables have been boiled, it is called beef brose, kale brose, &c.

STOCK. Among cooks, is condensed soup or jelly, used to make extemporaneous soup, broth, &c.

STOMACH AFFECTIONS. Those of a character to admit of being usefully noticed in a popular work are referred to under the heads **APPETITE, DYSPEPSIA, SICKNESS, &c.**

Dr. Budd recommends small doses of ipecacuanha as a remedy for those cases of indigestion in which digestion is slow, and the food lies heavily on the stomach, and there is an inability for mental or bodily exertion for some time after meals. He says it should be given in the morning, fasting, and in quantity barely sufficient to occasion a slight feeling of vermiculating motion in the stomach, but without causing any sensation of pain or nausea. The dose to produce this effect varies from $\frac{1}{4}$ to 2-grs. He thinks there is no other medicine which appears so effectual in removing the affections in question. Small doses of rhubarb, ginger, and cayenne pepper, have a similar kind of action, and may be given singly or together for the same purpose. "I generally prescribe from $\frac{1}{4}$ to 1 gr. of ipecacuanha, in a pill, with 3 or 4 grs. of rhubarb. With many, a favourite remedy for the discomfort resulting from slow digestion is a grain of cayenne paper, with 3 or 4 grs. of rhubarb. The best time for giving these medicines is shortly" (say $\frac{1}{2}$ an hour) "before any meal after which a sense of oppression is usually felt."

STOPPERS, when obstinately immovable in bottles, are the most safely treated by patiently hitting them upwards alternately on opposite sides with a piece of wood. When this fails, the part may be dipped into hot water.

STORM-GLASS. A philosophical toy, consisting of a thin glass tube about 12 inches long and $\frac{1}{2}$ inch in diameter, about three-fourths filled with the following liquid, and covered with a brass cap having an almost capillary hole through it, or else tied over with bladder.

The solution. Take of camphor, 2 drs.; nitre, $1\frac{1}{2}$ dr.; sal ammoniac, 1 dr.; proof spirit, $2\frac{1}{2}$ fl. oz.; dissolve, and place it in the

tube above referred to. *Used* to foretell changes of the weather.

STRABISMUS. *Syn.* SQUINTING. This need not be described. When one eye only is affected, an excellent plan is to blindfold the sound eye during several hours each day, until the affection be removed. When both eyes are affected, a projecting piece of pasteboard, in the line of the nose, may be worn as much as possible with the same object. In bad cases of squinting inwards, as it is called, the division of the internal rectus muscle of the eyeball, by a skilful surgeon, is said to often relieve the deformity.

STRAPPING. Spread adhesive plaster. *Used* to dress wounds, &c.

STRASS. See ENAMEL.

STRAWBERRY. *Syn.* FRAGARIA, L. The fruit of *Fragaria vesca* (Linn.), or strawberry plant. Strawberries are, perhaps, the mildest of all the cultivated fruits; they are cooling, and slightly laxative and diuretic; rubbed on the teeth, they dissolve the tartar, and whiten them. They were formerly in repute in gout, stone, and consumption. The root of the plant is aperient.

STRAW PLAIT, and the articles made of it, are bleached by exposing them to the fumes of burning sulphur in a close chest or box; or, by immersing them in a weak solution of chloride of lime, and afterwards well washing them in water. Water acidulated with oil of vitriol or oxalic acid is also used for the same purpose. Straw plait may be dyed with any of the simple liquid dyes.

STRONTIUM. Sr. The metallic base of the earth strontia. It was discovered by Sir H. Davy, in 1808. It closely resembles barium, but is less lustrous. With chlorine it combines to form chloride of strontium, a somewhat deliquescent salt, soluble in 2 parts of cold and in less of boiling water, and freely soluble in alcohol. With oxygen it forms an oxide.

Test. Strontium salts are precipitated by sulphuric acid and alkaline carbonates and sulphate. They are distinguished from barium by not giving such a decided precipitate with sulphates, and by not being precipitated by bichromate of potassium. From calcium, by sulphates of calcium solution giving a precipitate, and by concentrated solutions giving a precipitate with chromate of potassium. It is distinguished from magnesium by the insolubility of its sulphate.

Strontium, Oxide of. SrO. *Syn.* PROTOXIDE OF STRONTIUM, STRONTIA. *Prep.* Quite pure crystalline nitrate of strontium. *Prop.* Grayish-white powder, uniting with water to form a white, somewhat soluble substance, the hydrate of strontium, Sr(HO)₂.

With acids it forms various salts, of which the carbonate is a white, insoluble powder, and the nitrate a white crystalline salt, soluble in 5 parts, of cold water, and in alcohol, communicating a brilliant red colour to flame.

STROPHULUS. A papular eruption peculiar to infants. There are several varieties:—In strophulus intertinctus, red gum, or red gown, the pimples rise sensibly above the level of the cuticle, possess a vivid red colour, and are usually distinct from each other; they commonly attack the cheeks, forearm, and back of the hand, and, occasionally, other parts of the body.—In strophulus albidus, or white gum, there are a number of minute whitish specks, which are, sometimes, surrounded by a slight redness. The two preceding varieties commonly occur during the first two or three months of lactation.—In strophulus confertus, rank red gum, or tooth rash, which usually appears about the fourth or fifth month, the pimples usually occur on the cheeks and sides of the nose, sometimes on the forehead and arms, and still less frequently on the loins. They are smaller, set closer together, and less vivid, but more permanent than in the common red gum.—In strophulus volutans small circular patches or clusters of pimples, each containing from 6 to 12, appear successively on different parts of the body, accompanied with redness; and as one patch declines another springs up near it, by which the efflorescence often spreads gradually over the whole face and body.—In strophulus candidus the pimples are larger than in the preceding, and are pale, smooth, and shining; it principally attacks the upper parts of the arms, the shoulders, and the loins. The last two varieties commonly appear between the third and ninth month.

The *treatment* of the above affections consists chiefly in removing acidity and indigestion, and duly regulating the bowels by an occasional dose of magnesia or rhubarb, or both combined. Diarrhœa may be met by the warm bath and the daily use of arrow-root (genuine), to which a teaspoonful or two of pure port wine has been added; and itching and irritation may be alleviated by the use of a lotion consisting of water, to which a little milk, lemon juice, borax, or glycerin, has been added.

STRYCHNINE. C₂₁H₂₃N₃O₉. *Syn.* STRYCHNINA, STRYCHNIA (B. P., Ph. L. E. & D.), L. *Prep.* 1. Dissolve hydrochlorate or sulphate of strychnine in distilled water, and throw down the alkaloid with ammonia, carefully avoiding excess; redissolve the precipitate in hot rectified spirit; and collect the crystals which form as the liquid cools.

2. (Ph. D.) Nux vomica (in powder), 1 lb., is digested for 24 hours in $\frac{1}{2}$ gal. of water acidulated with 2 fl. drs. of sulphuric acid, after which it is boiled for half an hour, and the decoction decanted; the residuum is boiled a second and a third time with a fresh $\frac{1}{2}$ gal. of water acidulated with 1 fl. dr. of the acid, and the undissolved matter is finally submitted to strong expression; the decoctions are next filtered and concentrated to the consistence of a syrup, which is boiled with rectified spirit, 3 pints, for about 20 minutes; hydrate of calcium,

1 oz., or q.s., being added in successive portions during the ebullition, until the solution becomes distinctly alkaline; the liquid is then filtered, the spirit distilled off, and the residuum dissolved in diluted sulphuric acid, q.s.; ammonia, in slight excess, is added to the filtered solution, and the precipitate which falls is collected upon a paper filter, and dried; it is next redissolved in a minimum of boiling rectified spirit, and digested with $\frac{1}{2}$ oz. of animal charcoal for 20 minutes; the filtered liquid, as it cools, deposits strychnine, in crystals.

Prop. A white, inodorous, infusible powder; or small, but exceedingly brilliant, transparent, colourless, octahedral crystals; soluble in about 7000 parts of water at 60°, and in 2500 parts at 212° Fahr.; freely soluble in hot rectified spirit; insoluble in absolute alcohol, ether, and solutions of the caustic alkalies; imparts a distinctly bitter taste to 600,000 times its weight of water (1 part in 1,000,000 parts of water is still perceptible—Fownes); exhibits an alkaline reaction; and forms salts with the acids, which are easily prepared, are crystallisable, and well defined.

Tests.—1. Potassium hydrate and the carbonate produce, in solutions of the salts of strychnia, white precipitates, which are insoluble in excess of the precipitant, and which, when viewed through a lens magnifying 100 times, appear as aggregates of small crystalline needles. In weak solutions the precipitate only separates after some time, in the form of crystalline needles, which are, however, in this case, perfectly visible to the naked eye.—2. Ammonia gives a similar precipitate, which is soluble in excess of the precipitant.—3. Bicarbonate of sodium produces, in neutral solutions, a like white precipitate, which is insoluble in excess, but which redissolves on the addition of a single drop of acid; in acid solutions no precipitate occurs for some time, in the cold, but immediately on boiling the liquid.—4. Nitric acid dissolves pure strychnia and its salts to colourless fluids, which become yellow when heated. Commercial strychnine, from containing a little brucine, is reddened by this test.—5. A minute quantity of strychnine being mixed with a small drop of concentrated sulphuric acid, placed on a white capsule or slip of glass, forms a colourless solution, but yields, on the addition of a very small crystal of bichromate of potassium, or a very minute portion of chromic acid, a rich violet colour, which gradually changes to red and yellow, and disappears after some time. The $\frac{1}{100000}$ th of a grain yields very distinct indications.—6. Pure oxide or peroxide of lead produces a similar reaction to the last, provided the sulphuric acid contain about $1\frac{1}{2}$ of nitric acid.

Pois. The characteristic symptom is the special influence exerted upon the nervous system, which is manifested by a general contraction of all the muscles of the body, with rigidity of the spinal column. A profound calm soon succeeds, which is followed by a

new tetanic seizure, longer than the first, during which the respiration is suspended. These symptoms then cease, the breathing becomes easy, and there is stupor, followed by another general contraction. In fatal cases these attacks are renewed, at intervals, with increasing violence, until death ensues. One phenomenon which is only found in poisonings by substances containing strychnine is, that touching any part of the body, or even threatening to do so, instantly produces the tetanic spasm.

Treat. The stomach should be immediately cleared by means of an emetic, tickling the fauces, &c. To counteract the asphyxia from tetanus, &c., artificial respiration should be practised with diligence and care. "If the poison has been applied externally, we ought immediately to cauterise the part, and apply a ligature tightly above the wound. If the poison has been swallowed for some time, we should give a purgative clyster, and administer draughts containing sulphuric ether or oil of turpentine, which in most cases produce a salutary effect. Lastly, injections of chlorine and decoction of tannin are of value."

According to Ch. Gunther, the greatest reliance may be placed on full doses of opium, assisted by venesection, in cases of poisoning by strychnia or nux vomica. His plan is to administer this drug in the form of solution or mixture, in combination with a saline aperient.

Uses, &c. It is a most frightful poison, producing tetanus and death in very small doses. Even $\frac{1}{2}$ gr. will sometimes occasion tetanic twitchings in persons of delicate temperament. $\frac{1}{4}$ gr. blown into the throat of a small dog produced death in 6 minutes. In very minute doses it acts as a useful tonic in various nervous diseases, chronic diarrhoea, leucorrhoea, &c.; in slightly larger ones, it has been advantageously employed in certain forms of paralysis, in tic douloureux, impotence, &c.—*Dose* $\frac{1}{16}$ to $\frac{1}{8}$ gr. (dissolved in water by means of a drop of acetic or hydrochloric acid), gradually and cautiously increased until it slightly affects the muscular system. Eternally, $\frac{1}{8}$ to $\frac{1}{4}$ gr. at a time.

The Edinburgh College ordered the nux vomica to be exposed for two hours to steam, to soften it, then to chop or slice it, next to dry it by the heat of a vapour bath or hot air, and, lastly, to grind it in a coffee-mill. In the process of the Ph. L. 1836 magnesia was employed to effect the precipitation. In the last Ph. L. strychnine appears in the *Materia Medica*. Most of that of commerce is now obtained from St. Ignatius's bean, which, according to Geiseler, yields $1\frac{1}{2}$ of it; whereas 3 lbs. of nux vomica produce little more than 1 dr. Commercial strychnine may be freed from brucine by digesting the powder in dilute alcohol.

The salts of strychnine, which are occasionally asked for in trade, are the acetate (strych-

nise acetatas), hydrochlorate or muriate (s. murias—Ph. D.), hydriodate (s. hydriodas), nitrate (s. nitras), phosphate (s. phosphas), and sulphate (s. sulphas). All of these may be easily formed by simply neutralising the acid previously diluted with 2 or 3 parts of water, with the alkaloid, assisting the solution with heat; crystals are deposited as the liquid cools, and more may be obtained by evaporating the mother-liquor.

STUCCO. The name of several calcareous cements or mortars. Fine stucco is the third or last coat of three-coat plaster, and consists of a mixture of fine lime and quartzose sand, which, in application, is "twice hand-floated and well trowelled."

STUFFING. Seasoning, placed in meat, poultry, game, &c., before dressing them, to give them an increased relish. The same materials, formed into balls, are added to soups, gravies, &c., under the name of **FORCE-MEAT**.

Prep. 1. (For fowls, &c.) Shred a little ham or gammon, some cold veal or fowl, some beef suet, a small quantity of onion, some parsley, a very little lemon peel, salt, nutmeg, or pounded mace, and either white pepper or cayenne, and bread crumbs; pound them in a mortar, and bind it with 1 or 2 eggs.

2. (For hare, or anything in imitation of it—Mrs. Rundell.) The scalded liver, an anchovy, some fat bacon, a little suet, some parsley, thyme, knotted marjoram, a little shalot, and either onion or chives, all chopped fine; with some crumbs of bread, pepper, and nutmeg, beaten in a mortar with an egg.

3. (For goose.) From sage, onion, suet, and crump of bread. Geese are now, however, more commonly stuffed with veal-stuffing.

4. (For veal—Soyer.) Chop $\frac{1}{2}$ lb. of suet, put it into a basin with $\frac{1}{2}$ lb. of bread crumbs, a teaspoonful of salt, a $\frac{1}{4}$ do. of pepper, a little thyme or lemon peel chopped, and 3 whole eggs; mix well.

Obs. 1 lb. of bread crumbs and one more egg may be used; they will make it cut firmer. This, as well as No. 1, is now commonly employed for poultry and meat. Ude, a great authority in these matters, observes that "it would not be amiss to add a piece of butter, and to pound the whole in a mortar." "Grated ham or tongue may be added to this stuffing." (Rundell.) This is also used for turkeys, and for 'forcemeat patties.'

STUFFING (Birds, &c.). The skins are commonly dusted over with a mixture of camphor, alum, and sulphur, in about equal quantities; or, they are smeared with *Bérou's arsenical soap*, noticed at page 1049. According to Grace Calvert, carbolic acid, which is worth only about 2s. per gal., is superior to all other substances for preserving the skins of birds and animals, as well as corpses.

STURGEON. Several species of *Acipenser* pass under this name. The common sturgeon is the *Acipenser sturio* (Linn.). The roe is

made into 'caviare,' the swimming-bladder into 'isinglass.'

STY. *Syn.* **STYE**, **STIAN**; **HORDEOLUM**, L. A small inflamed tumour, or boil, at the edge of the eyelid, somewhat resembling a barley-corn. It is usually recommended to promote its maturation by warm applications, since "the styte, like other furunculous inflammations, forms an exception to the general rule, that the best mode in which inflammatory swellings can end in resolution."

STYPTICS. *Syn.* **STYPTICA**, L. Substances which arrest local bleeding. Creasote, tannic acid, alcohol, alum, and most of the astringent salts, belong to this class.

Styptic, Brocchieri's. A nostrum consisting of the water distilled from pine tops.

Styptic, Eaton's. A solution of sulphate disguised by the addition of some unimportant substances. "Helvetius's styptic was for a long time employed under this title." (Paris.)

Styptic, Helvetius's. *Syn.* **STYPTICUM HELVETII**, L. Iron filings (fine), and cream of tartar, mixed to a proper consistence with French brandy. See **HELVETIUS'S STYPTIC POWDER** (page 979).

STYRAX. *Syn.* **STORAX**, **STORAX BALSAM**; **STYRAX** (Ph. L. & E.), L. "The liquid balsam of an uncertain plant." (Ph. L.) The "balsamic exudation of *Styrax officinale*, Linn." (Ph. E.), or cane storax tree. Two or three varieties are known in commerce:—Liquid storax (*styrax liquida*), lump or-red storax (s. *in massis*), which is generally very impure; storax in tears (s. *irachrymis*), and storax in reeds (s. *calamita*). The last are now seldom met with in trade.

PREPARED STORAX (*styrax colata*; s. *preparata* (B. P., Ph. L.) is obtained by dissolving storax, 1 lb., in rectified spirit, 4 pints, by a gentle heat, straining the solution through linen, distilling off greater part of the spirit, and evaporating what is left to a proper consistence by the heat of a water bath. It is less fragrant than the raw drug.

Storax is stimulant, expectorant, and fervine. It was formerly much used in menstrual obstructions, phthisis, coughs, asthmas, and other breath diseases. It is now chiefly used as a perfume.—*Dose.* 6 to 20 or 30 grs. (10 to 20 grs. twice a day, B. P.).

A factitious strained Storax is made as follows:—1. Balsam of Peru, 1 lb.; balsam of tolu, 4 lbs.; mix.

2. Gum benzoin, 8 lbs.; liquid storax, 6 lbs.; balsam of tolu and Socotrine aloes, of each, 3 lbs.; balsam of Peru, 2 lbs.; N. S. W. yellow gum, 7 lbs.; rectified spirit, 7 galls.; digest, with frequent agitation, for a fortnight, strain and distil off the spirit (about 5 $\frac{1}{2}$ galls.) until the residuum has a proper consistence. *Prod.* 28 lbs.

3. Liquid storax, 1 oz.; Socotrine aloes, $\frac{1}{4}$ lb.; balsam of tolu, 2 lbs.; rectified spirit, q. s.

SUB. See **NOMENCLATURE AND SALTS**.

SU'BERIC ACID. Obtained by boiling rasped cork for some time in nitric acid.

SUBLIMA'TION. The process by which volatile substances are reduced to the state of vapour by heat, and again condensed in the solid form. It differs from ordinary distillation in being confined to dry solid substances, and in the heat employed being, in general, much greater.

SUB'STANTIVE COLOURS. In the art of dyeing, are such as impart their tints to cloth and yarns without the intervention of a mordant; in contradistinction to adjective colours, which require to be fixed by certain 'intermedes,' or substances which have a joint affinity for the colouring matter and the material to be dyed.

SUCCIN'IC ACID. $C_4H_4O_4$. *Syn.* ACIDUM SUCCINICUM. *Prop.* From amber, in coarse powder, mixed with an equal weight of sand, and distilled by a gradually increased heat; or from the impure acid obtained during the distillation of oil of amber; the product in both cases being purified by wrapping it in bibulous paper, and submitting it to strong pressure, to remove the oil, and then resubliming it.

From malic acid, by fermentation, or by digestion with hydriodic acid in sealed tubes.

Prop., &c. Colourless; inodorous (When pure); crystallises in oblique rhombic prisms; soluble in 5 parts of cold and in $2\frac{1}{2}$ parts of boiling water; fusible and volatile, without decomposition. Its salts are called 'succinates,' most of which are soluble. Succinate of ammonium is used as a test for iron. Succinic acid is distinguished from benzoic acid by its greater solubility, and by giving a brownish or pale red bulky precipitate with ferric chloride in neutral solutions; whereas that with benzoic acid is paler and yellower.

Uses, &c. Succinic acid is antispasmodic, stimulant, and diuretic, but is now seldom used.—*Dose.* 5 to 15 grs.

SUC'CORY. Chicory, or wild endive. (See CHICORY.)

SUDORIF'ICS. See DIAPHORETICS.

SU'ET. *Syn.* SEVUM, SEBUM, L. This is prepared from the fat of the loins of the sheep or bullock by melting it by a gentle heat, and straining the liquid fat. In this state it forms the ADIPS OVILLUS (Ph. D.), SEVUM (Ph. L. & E.), SEVUM OVILLUM, or SEVUM PRÆPARATUM, employed in medicine and perfumery, as the basis of ointments, cerates, plasters, pommades, &c.

Suet, Mel'ilot. *Syn.* SEVUM MELLILOTI, L. *Prop.* From suet, 8 lbs.; melilot leaves, 2 lbs.; boil until the leaves are crisp, strain, and allow it to cool very slowly, so that it may 'grain well.' Used by farriers, and to make melilot plaster.

SUFFOCA'TION. The treatment varies with the cause. See ASPHYXIA, CHARCOAL, DROWNING, HANGING, SULPHURETTED HYDROGEN, &c.

SUG'AR. $C_{12}H_{22}O_{11}$. *Syn.* CANE SUGAR; SACCHARUM, L.; SUCRE, Fr. This well-known and most useful substance is found in the juice of many of the canes or grasses, in the sap of several forest trees, and in the roots of various plants. In tropical climates it is extracted from the sugar-cane (*Saccharum officinarum*), in China from the sweet sorgho (*Sorghum saccharatum*), in North America from the sugar-maple (*Acer saccharinum*), and in France from white beet-root (*Beta vulgaris*, var. *alba*). The ordinary sugar used in England is extracted from the sugar-cane which is raised so abundantly in our numerous colonies.

The manufacture of sugar is exclusively conducted on the large scale. The recent canes are crushed between rollers, and the expressed juice is suffered to flow into a suitable vessel, where it is slowly heated to nearly the boiling-point, to coagulate albuminous matter. A small quantity of milk of lime is then added, to remove mechanical impurities, and the skimmed and clarified juice, after being sufficiently concentrated by rapid evaporation in open pans, is transferred to coolers, and thence into upright casks perforated at the bottom, and so placed that the syrup, or uncrystallisable portion, may drain off into a tank or cistern from the newly formed sugar. During the period of crystallisation it is frequently agitated, in order to hasten the change, and to prevent the formation of large crystals. The solid portion of the product forms moist, raw, or muscovado sugar; the uncrystallisable syrup, molasses or treacle.¹

Raw sugar is refined by redissolving it in water, adding to the solution albumen, under the form of serum of blood or white of egg, and, sometimes, a little lime-water, and heating the whole to the boiling-point; the impurities are then removed by careful skimming, and the syrup is decoloured by filtration through recently burnt animal charcoal; the clear decolorised syrup is next evaporated to the crystallising-point in vacuo, and at once transferred into conical earthen moulds, where it solidifies, after some time, to a confusedly crystallised mass; this, when drained, washed with a little clean syrup, and dried in a stove, constitutes ordinary loaf, lump, or refined sugar. When the crystallisation is allowed to take place quietly and slowly, the product is sugar candy. The evaporation at a low temperature in vacuum-pans has the effect of diminishing the yield of treacle.

Prop. Sugar requires for its solution only $1\frac{3}{4}$ of its weight of cold and still less of boiling water; it is slowly dissolved by cold rectified spirit; it dissolves in 4 parts of boiling rectified spirit and in 80 parts of boiling absolute alcohol; it melts by heat, and cools to a glassy amorphous mass (barley

¹ The term 'molasses' is usually restricted to the drainings from raw sugar, and 'treacle' to the thicker syrup which has drained from refined sugar in the moulds.

sugar); at about 400° Fahr. it suffers rapid decomposition, and fuses to a brown, uncrystallisable mass (caramel); long boiling with water increases its colour, and lessens its tendency to crystallise; its aqueous solution dissolves alkalies, earths, and many metallic oxides, with facility; weak syrups take up about half as much hydrate of calcium as they contain sugar; when slowly crystallised, it assumes the form of oblique 4-sided prisms, terminated by 2-sided summits. Sp. gr. 1.60 (1.577—Ure).

Pur. 1. Moist or muscovado sugar and crushed lump sugar are occasionally adulterated with chalk, plaster, sand, potato-flour, and other fecula; but frequently, and in certain neighbourhoods constantly, with starch sugar or potato-sugar. These frauds may be detected as follows:—

Tests.—1. Pure cane sugar dissolves freely and entirely in both water and proof spirit, forming transparent colourless solutions, which are unaffected by either sulphuretted hydrogen or dilute sulphuric acid.—2. Its solution bends the luminous rays in circumpolarisation to the right, whereas grape and fecula sugars bend it to the left.—3. (Chevallier.) Boiled for a short time in water containing 2 or 3% of caustic potassa, the liquid remains colourless; but it turns brown, which is more or less intense, according to the quantity, if starch sugar is present. Even 2 or 3% of starch sugar may be thus detected.—4. (E. Krantz.) A filtered solution of 35 grs. of cane or beet sugar in 1 fl. oz. of water, mixed with 3 grs. of pure hydrate of potassium, and then agitated with 1½ gr. of sulphate of copper in an air-tight bottle, remains clear, even after the lapse of several days; but if starch sugar be present, a red precipitate is formed after some time; and if it is present in considerable quantity, the copper will be wholly converted into oxide within 24 hours, the solution turning first blue or green, and then entirely losing its colour.—5. (Trommer's test.) A solution of cane sugar is mixed with a solution of sulphate of copper, and hydrate of potassium added in excess; a blue liquid is obtained, which, on being heated, is at first but little altered; a small quantity of red powder falls after a time, but the liquid long retains its blue tint. When grape sugar or fecula sugar is thus treated, the first application of heat throws down a copious greenish precipitate, which rapidly changes to scarlet, and eventually to dark red, leaving a nearly colourless solution. This is an excellent test for distinguishing the two varieties of sugar, or discovering an admixture of grape sugar with cane sugar. The ~~very~~ ^{small} part of grape sugar may be thus detected. The proportion of oxide of copper produced affords a good criterion, not only of the purity of the sugar, but also of the extent of the adulteration.—6. (Ure.) Dissolve a little sulphate of copper (say 20 grs.) in a measured quantity of water, and add to it, in the cold, a

solution of hydrate of potassium, until, by testing with turmeric paper, the liquid appears faintly alkaline, shown by the paper becoming slightly brown. If a small quantity of this test-liquor (previously well shaken) be added to an aqueous solution of the sugar, and the whole boiled, the solution becomes at first green, and then olive-green, if dextrin is present; but if it contain grape sugar, the salt of copper is immediately reduced into the state of orange and oxide; whilst a solution of pure sugar undergoes no change, or is scarcely altered.

—7. The presence of the inspissated sweet waste liquor (crude glycerin) of the stearin manufactories, now a common adulterant, may be detected by the inferior sweetness and by the moist and 'sickly' appearance of the sugar.—8. The specific gravities and crystalline forms offer other means of distinguishing the varieties of sugar.

Concluding remarks.—Refined sugar (SACCHARUM—Ph. L., S. PURUM—Ph. E., S. PURIFICATUM—Ph. D.), raw sugar (S. COMMUNE—Ph. E.), and molasses or treacle (SACCHARI FÆX—Ph. L. & E.), were official.

The relative sweetening power of cane sugar is estimated at 100; that of pure grape sugar, at 60; that of fecula or starch sugar, at 30 to 40.

According to Messrs. Oxland's method (patented 1849) of defecating and bleaching the juice of beet-root, cane, &c., acetate of aluminium, formed by dissolving 4 lbs. of that earth in acetic acid, is boiled with each ton of sugar, and as soon as the acetic acid is nearly all driven off, a solution of tannin, formed from 1 lb. of bruised valonia and 2 galls. of hot water, is added to the boiling sprug; the excess of aluminium is afterwards separated by lime, and the usual method of further procedure adopted. By their second patent (1851), superphosphate of aluminium or of calcium is substituted for acetate of aluminium, in the proportion of about 6 lbs. of aluminium, dissolved in phosphoric acid, for each ton of sugar.

Sugar may be obtained from nearly all sweet vegetable substances, by a process essentially similar to that described above.

Sugar, Alum. *Syn.* SACCHARUM ALUMINATUM, ALUMEN SACCHARINUM, L. From alum and white sugar, in fine powder, equal parts, formed into minute sugar-loaf shaped lumps with mucilage of gum arabic made with rose water. Used to make astringent lotions and eye-waters.

Sugar, Barley. *Syn.* SACCHARUM HORDEATUM, PENIDIUM, SACCHARUM PENIDIUM, L. *Prep.* Take of saffron, 12 grs.; hot water, q. s.; sugar, 1 lb.; boil to a full 'candy height,' or that state called 'crack,' or 'crackled sugar,' when 2 or 3 drops of clear lemon juice or white vinegar must be added, and the pan removed from the fire and set for a single minute in cold water, to prevent its burning; the sugar must be then at once poured out on an oiled marble slab, and either cut into pieces or

rolled into cylinders, and twisted in the usual manner. 1 drop of oil of citron, orange, or lemon, will flavour a considerable quantity. White barley sugar is made with a strained decoction of barley instead of water, or starch is added to whiten it.

Sugar, Beet-root. *Syn.* SACCHARUM BETE, L. Sugar obtained from the white beet. (See above.) It is identical with cane sugar.

Diabetic Sugar. Grape sugar found in the urine of persons labouring under diabetes. In *diabetes insipidus* a substance having the general properties of a sugar, but destitute of a sweet taste, appears to be produced. (Thénard.)

Sugar, Gelatin. See GLYCOCINE.

Sugar, Grape, $C_6H_{12}O_6 \cdot H_2O$. *Syn.* GLUCOSE, FRUIT SUGAR; SACCHARUM UVÆ, S. FRUCTUS, L. This substance is found in the juice of grapes and other fruit, in the urine of diabetic patients, and in the liquid formed by acting on starch and woody fibre with dilute sulphuric acid.

Prep. 1. From the juice of ripe grapes or an infusion of the ripe fruit (raisins), by saturating the acid with chalk, decanting the clear liquid, evaporating to a syrup, clarifying with white of egg or bullock's blood, and then carefully evaporating to dryness; it may be purified for chemical purposes by solution and crystallisation in either water or boiling alcohol. Like other sugar, it may be decoloured by animal charcoal.

2. From honey, by washing with cold alcohol, which dissolves the fluid syrup and leaves the solid crystallisable portion.

Prop. It is less sweet and less soluble than cane sugar, requiring $1\frac{1}{2}$ part of cold water for its solution; instead of bold crystals, it forms granular warty masses, without distinct crystalline faces; it does not easily combine with either oxide of calcium or oxide of lead; with heat, caustic alkaline solutions turn it brown or black, but it dissolves in oil of vitriol without blackening, the reverse being the case with cane sugar; with chloride of sodium it forms a soluble salt, which yields large, regular, and beautiful crystals. Sp. gr. 1.400.

Obs. Cane sugar is converted into grape sugar during the process of fermentation, and by the action of acids. See SUGAR (page 1087) and STARCH SUGAR (below).

Sugar, Maple. *Syn.* SACCHARUM ACERINUM, L. From the juice of the sugar maple. The average product from each tree is about 6 lbs. per season. It is identical with cane sugar. (See page 1087.)

Sugar, Milk. $C_{12}H_{22}O_{11} \cdot H_2O$. *Syn.* SUGAR OF MILK, LACTIN; SACCHARUM LACTIS (Ph. D.), L. *Prep.* Gently evaporate clarified whey until it crystallises on cooling, and purify the crystals by digestion with animal charcoal and repeated crystallisations.

Prop. &c. White, translucent, very hard, cylindrical masses or four-sided prisms; soluble in about 6 parts of cold and in 2 parts of boiling water; it is unsusceptible of the vinous

fermentation, except under the action of dilute acids, which convert it into grape sugar; in solution, it is converted into lactic or butyric acid by the action of caseine and albuminous matter. Milk contains about $5\frac{1}{2}\%$ of it. (Boussingault.)

Obs. Sugar of milk is chiefly imported from Switzerland. In this country it is chiefly used as a vehicle for more active medicines, especially among the homeopaths.

Sugar, Starch. *Syn.* POTATO SUGAR, FÆCULA S. This is grape sugar obtained by the action of diastase on starch, in the manner noticed under GUM (British), or by the action of dilute sulphuric acid on starch, or of the strong acid on lignin, or on substances containing it.

Prep. 1. Potato starch, 100 parts; water, 400 parts; sulphuric acid, 6 parts; mix, boil for 35 or 40 hours, adding water, to make up for evaporation; then saturate the acid with lime or chalk, decant or filter, and evaporate the clear liquor. Under pressure, the conversion is more rapid. *Prod.* 105 $\frac{1}{2}\%$.

2. Shreds of linen or paper, 12 parts; strong sulphuric acid, 17 parts (Braconnot; 5 of acid, and 1 of water—Vogel); mix in the cold; in 24 hours dilute with water, and boil it for 10 hours; then neutralise with chalk, filter, evaporate to a syrup, and set the vessel aside to crystallise. *Prod.* 114 $\frac{1}{2}\%$. Sawdust, glue, &c., also yield grape sugar by like treatment. See LIGNIN.

SUGAR-BOILING. The art or business of the confectioner or sugar-baker; the candying of sugar. The stages are as follow:—Well clarified and perfectly transparent syrup is boiled until a 'skimmer' dipped into it, and a portion 'touched' between the forefinger and thumb, on opening them, is drawn into a small thread, which crystallises and breaks. This is called a 'weak candy height.' If boiled again, it will draw into a larger string, and if bladders may be blown through the 'drippings' from the ladle, with the mouth, it has acquired the second degree, and is now called 'bloom sugar.' After still further boiling, it arrives at the state called 'feathered sugar.' To determine this re-dip the skimmer, and shake it over the pan, then give it a sudden flirt behind, and the sugar will fly off like feathers. The next degree is that of 'crackled sugar,' in which state the sugar that hangs to a stick dipped into it, and put directly into a pan of cold water, is not dissolved off, but turns hard and snaps. The last stage of refining this article reduces it to what is called 'caramel sugar,' proved by dipping a stick first into the sugar, and then into cold water, when, on the moment it touches the latter, it will, if matured, snap like glass. It has now arrived at a 'full candy height.' Care must be taken throughout that the fire is not too fierce, as, by flaming up against the sides of the pan, it will burn and discolour the sugar; hence the boiling is best conducted by steam heat.

Any flavour or colour may be given to the candy by adding the colouring matter to the syrup before boiling it, or the flavouring essences when the process is nearly complete. See STAINS, &c.

SUGAR CANDY. *Syn.* SACCHARUM CANDIDUM, S. CRYSTALLINUM, S. CRYSTALLIZATUM, L. Sugar crystallised by leaving the saturated syrup in a warm place (90 to 100° Fahr.), the shooting being promoted by placing sticks, or threads, at small distances from each other in the liquor; it is also deposited from compound syrups, and does not seem to retain much of the foreign substances with which they are loaded. Brown sugar candy is prepared in this way from raw sugar; white do., from refined sugar; and red do., from a syrup of refined sugar which has been coloured red by means of cochineal.

Sugar candy is chiefly used as a sweetmeat; and, being longer in dissolving than sugar, in coughs, to keep the throat moist; reduced to powder, it is also blown into the eye, as a mild escharotic in films or dimness of that organ.

SUGAR OF LEAD. Acetate of lead.

SUGAR PLUMS. *Syn.* BON-BONS, DRAGÉES, Fr. These are made by various methods, among which are those noticed under DROPS (Confectionery), LOZENGES, and PASTILS, to which may be added the following:—Take a quantity of sugar syrup, in the proportion to their size, in that state called a 'blow' (which may be known by dipping the skimmer into the sugar, shaking it, and blowing through the holes, when parts of light may be seen), and add a drop or two of any esteemed flavouring essence. If the 'bon-bons' are preferred white, when the sugar has cooled a little, stir it round the pan till it grains and shines on the surface. When all is ready, pour it through a funnel into little clean, bright, leaden moulds, which must be of various shapes, and be previously slightly moistened with oil of sweet almonds; it will then take a proper form and harden. As soon as the plums are cold, take them from the moulds; dry them for two or three days in the air, and put them upon paper. If the bon-bons are required to be coloured, add the colour just as the sugar is ready to be taken off the fire.

CRYSTALLISED BON-BONS are prepared by dusting them with powdered double-refined lump sugar before drying them.

LIQUEUR BON-BONS, now so beautifully got up by the Parisian confectioners, are obtained by pressing pieces of polished bone or metal into finely powdered sugar, filling the hollow spaces so formed with saturated solutions of sugar in the respective liquours, and then spreading over the whole an ample layer of powdered sugar. In the course of three or four days the bon-bons may be removed, and tinted by the artist at will. Instead of white powdered sugar ordered above, coloured sugar may be used. These bon-bons are found to be hol-

low spheres, containing a small quantity of the spirit or liqueur employed, and will keep keeping for many months. See SWEETMEATS, &c.

SUGARS (Medicated). *Syn.* SACCHARIDES; SACCHARA MEDICATA, L.; SACCHAROLÉS, SACCHARURES, Fr. Some of these are prepared by moistening white sugar with the medicinal substance, then gently drying it, and rubbing it to powder; in other cases they are obtained in the manner noticed under PULVERULENT EXTRACTS, or OLEOSACCHARUM. The most valuable preparation of this class in British pharmacy is the saccharated carbonate of iron (FERRI CARBONAS CUM SACCHARO—Ph. L.).

SULPHATE. *Syn.* SULPHAS, L. A salt of sulphuric acid.

SULPHIDE. A salt consisting of sulphur and a metal or other basic radical.

SULPHINDYLIC ACID. *Syn.* SULPHINDIGOTIC ACID. An intensely blue pasty mass, formed by dissolving 1 part of indigo in about 15 parts of concentrated sulphuric acid. See SULPHATE OF INDIGO.

SULPHITE. A salt of sulphurous acid.

SULPHOCARBOLIC ACID. (SULPHOCARBOLATES.) Carbolic acid, when acted upon by bases, yields a class of salts termed carbolates. These compounds are very unstable; they readily absorb water from the air, which sets free carbolic acid; they usually have the powerful odour of the latter. When, however, equivalent weights of carbolic and sulphuric acids are mixed, union takes place, a definite double acid (sulphocarbolic) results, and the salts formed by this double acid with the various bases are entirely different from the simple salts of carbolic acid. They are very stable, very soluble, possess neither odour nor taste of carbolic acid, and are singularly beautiful in crystalline form.

Sulphocarbolic Acid $[HC_6H_5SO_4]$ is obtained by the crystallisation in long colourless needles; unlike carbolic acid, it is soluble in water, alcohol, and ether, in any proportions.

Sulphocarbolate of Sodium $[Na(C_6H_5)SO_4.Aq]$ is in brilliant, clear, rhombic prisms. The salt is very soluble in water. This salt can be administered as a medicine in doses of 20 to 60 grs.; it is slowly decomposed in the texture, carbolic acid being evolved. It thus becomes a very simple means of obtaining the beneficial effects of the administration of this antiseptic without the difficulties and dangers which attend it in its uncombined irritant and caustic form. It has proved of great service in the treatment of infectious diseases. Administered in the severest cases of diphtheria, malignant scarlet fever, typhoid, erysipelas, &c., the remedy has proved of extreme value.

The Sulphocarbulates of Potassium $[KC_6H_5SO_4]$ and Ammonium $[NH_4C_6H_5SO_4]$ are also brilliant crystals; they are freely soluble, administered with the greatest ease,

and have been used with success as remedial agents.

Sulphocarbonate of Calcium $[\text{Ca}(\text{C}_6\text{H}_5\text{SO}_4)_2 + \text{Aq.}]$ is obtained in very long, fine, densely interlacing crystals, which form in bulk, by their interlacement, a porous mass. Unlike the usual lime-salts, this is exceedingly soluble. This fact overcomes the great difficulty of treatment when in disease there is a deficiency of lime in the body, especially in rickets, in which disease the want of lime in the bones gives rise to distortions. The sulphocarbonate of magnesium crystallises in large, clear, rhombic prisms, easily soluble in water.

Sulphocarbonate of Iron $[\text{Fe}(\text{C}_6\text{H}_5\text{SO}_4)_2]$ is in colourless or pale green rhombic plates. It is readily administered, and seems in some instances to be preferred to other salts of iron. It seems to have been of especial use in the skin diseases of children, wherein there is much formation of matter.

Sulphocarbonate of Zinc $[\text{Zn}(\text{C}_6\text{H}_5\text{SO}_4)_2]$ is chiefly employed in solution as a lotion. By high surgical authorities it is considered to answer all the purposes of the antiseptic dressing of carbolic acid. It is inodorous, and has very slight irritating action.

Sulphocarbonate of Copper $[\text{Cu}(\text{C}_6\text{H}_5\text{SO}_4)_2]$ forms fine prismatic crystals of a blue colour. It is used as the zinc sulphocarbonate, chiefly as a lotion and dressing, in the proportion of 3 to 10 grains to the ounce of distilled water.

SULPHOCYANOGEN. A well-defined salt-radical, containing sulphur united to the elements of cyanogen. Its compounds are the sulphocyanides, most of which may be formed by directly saturating hydrosulphocyanic acid with the oxide or hydrate of the base; or, from the sulphocyanide of potassium and a soluble salt of the base, by double decomposition.

SULPHOPHENIC ACID. A synonym of sulphocarbolic acid. See **SULPHOCARBOLATES**.

SULPHOVINIC ACID. $\text{C}_6\text{H}_5\text{HSO}_4$. *Syn.* **SULPHETHYLIC ACID**; **ACIDUM SULPHOVINICUM**, L. This substance is formed by the action of heat on a mixture of alcohol and sulphuric acid; it is the intermediate product which is developed in the preparation of ether. The salts are called sulphovinates or sulphothylates.

SULPHUR. [Eng., L.] *Syn.* **BRIMSTONE**; **SOUFFRE**, Fr. An elementary substance. That of commerce is chiefly imported from Sicily and Italy, and is a volcanic production.

Var. The principal of these are—

AMORPHOUS SULPHUR, **BROWN S.**; **SULPHUR AMORPHUM**, S. **FUSCUM**, S. **INFORME**, S. **RUBRUM**, L. Prepared from sublimed sulphur, by melting it, increasing the heat to from 320° to 350° Fahr., and continuing it at that temperature for about half an hour, or until it becomes brown and viscid, and then pouring it into water. In this state it is ductile, like wax, may be easily moulded in any form, is much heavier than usual, and when it has

cooled does not again become fluid until heated to above 600° Fahr. The same effect is produced more rapidly by at once raising the temperature of the melted mass to from 430° to 480° Fahr.

PRECIPITATED SULPHUR, **HYDRATE OF SULPHUR**, **MILK OF S.**; **SULPHURIS HYDRAS**, **LAC SULPHURIS**, **SULPHUR PRÆCIPITATUM** (B. P., Ph. L.), L. *Prep.* From sublimed sulphur, 1 part; dry and recently slaked lime, 2 parts; water, 25 parts, or q. s.; boil for 2 or 3 hours, dilute with 25 parts more of water, filter, and precipitate with dilute hydrochloric acid; drain, and well wash the precipitate, and dry it by a gentle heat. Resembles sublimed sulphur in its general properties, but is much paler, and in a finer state of division. "A grayish-yellow powder, free from grittiness, and with no smell of sulphuretted hydrogen." (B. P.)

ROLL SULPHUR, **CANE S.**, **STICK S.**; **SULPHUR IN BACULIS**, S. **IN ROTULIS**, S. **ROTUNDUM**, L. This is crude sulphur, purified by melting and skimming it, and then pouring it into moulds. That obtained during the roasting of copper pyrites, and which forms the common roll sulphur of England, frequently contains from 3 to 7% of yellow arsenic.

SUBLIMED SULPHUR, **FLOWERS OF SULPHUR**; **FLORES SULPHURIS**, **SULPHUR** (Ph. L.), **SULPHUR SUBLIMATUM** (B. P., Ph. E. & D.), L. Prepared by subliming sulphur in iron vessels. For medical purposes, it is ordered to be well washed with water, and dried by a gentle heat. "A slightly gritty powder, of a fine greenish-yellow colour, without taste and without odour till heated." (B. P.)

SULPHUR VIVUM, **BLACK SULPHUR**, **CRUDE S.**, **HORSE BRIMSTONE**; **SULPHUR NIGRUM**, S. **CABALLINUM**, S. **GRISEUM**, L. This is crude native sulphur. It is a gray or mouse-coloured powder. The residuum in the subliming pot from the preparation of flowers of sulphur is now commonly substituted for it. It generally contains much arsenic, and is consequently very poisonous.

Pur. The sublimed sulphur of the shops is now, in general, of respectable quality, but the precipitated sulphur frequently contains about $\frac{1}{3}$ of its weight of sulphate of lime (plaster of Paris), owing to the substitution of sulphuric acid for hydrochloric acid in its manufacture. This sophistication is readily detected by strongly heating a little of the suspected sample in an iron spoon or shovel, when the sulphur is burnt or volatilised, and leaves behind the sulphate of lime as a white ash; this, when mixed with water, and gently dried, gives the amount of the adulteration. A still simpler plan is to dissolve out the sulphur in the sample with a little hot oil of turpentine or liquor of potassa; the undissolved portion is foreign matter.

Prop. Sulphur melts to a clear thin fluid, and volatilises at about 232° Fahr., and in open vessels rapidly takes fire, burning with a bluish flame. It is insoluble in both water

and alcohol; it is soluble in oil of turpentine and the fatty oils, and freely so in bisulphide of carbon and hot liquor of potassa. With oxygen it unites to form sulphurous anhydride, and with the metals to form sulphides. Sp. gr. 1.982 to 2.015.

Estim. The determination of the quantity of sulphur, phosphorus, and chlorine, in a state of combination, especially in organic mixtures, is often rather troublesome. The proportion of sulphur is best determined by oxidising a known weight of the substances by strong nitric acid, or by fusing it in a silver vessel with 10 or 12 times its weight of pure hydrate of potassa and about half as much nitre. The sulphur is thus converted into sulphuric acid, the quantity of which can be determined by dissolving the fused mass in water, acidulating the solution with nitric acid, adding a salt of baryta, and weighing the resulting sulphate. Phosphorus is, in like manner, oxidised to phosphoric acid, the quantity of which is determined by precipitation in combination with sesquioxide of iron, or otherwise. The chlorine is correctly determined by placing a small weighed portion in a combustion-tube, which is afterwards filled with fragments of pure quicklime. The lime is then brought to a red heat, and the vapour of the liquid driven over it, when chloride of calcium is formed. The contents of the tube, when cold, are dissolved in dilute nitric acid, filtered, the chlorine precipitated by nitrate of silver, and the chlorine weighed under the form of chloride of silver. See ORGANIC SUBSTANCES.

Uses, &c. Sulphur is extensively used in the manufacture of gunpowder, in bleaching, &c. &c. When swallowed, it acts as a mild laxative and stimulating diaphoretic; and has hence been long taken in various chronic skin diseases, in pulmonary, rheumatic, and gouty affections, and as a mild purgative in piles, prolapsus ani, &c. Externally, it is extensively used in skin diseases, especially the itch, for which it appears to be a specific.—*Dose.* 20 to 63 grs., in sugar, honey, treacle, or milk.

Sulphur, Chlorides of. Several of these compounds exist, but the following are the most important. 1. (DICHLORIDE, S_2Cl_2 .) Prepared by passing dry chlorine gas over the surface of sulphur melted in a bulb-tube or small retort connected with a well-cooled receiver. The product is a deep orange-yellow and very mobile liquid, which possesses a disagreeable odour, and boils at 280° Fahr. It is soluble in bisulphide of carbon, and in benzol, without decomposing. It dissolves sulphur in large quantities, especially when heated. A solution of the dichloride with excess of sulphur in crude benzol is used for vulcanising caoutchouc.

2. (CHLORIDE, HYPOCHLORIDE, or HYPOCHLORITE of the shops; SULPHURIS CHLORIDUM, S. HYPOCHLORIDUM, S. HYPOCHLORITIS, L.) This is prepared by spreading washed sulphur thinly on the bottom of a

wooden box, or other chamber, and passing chlorine gas slowly over until it ceases to be absorbed.

Obs. This last compound is of variable and undetermined constitution. It has been recommended for internal use, by Derksengi, in old gouty affections, combined with pains in the stomach, and in severe nervous fever.—

Dose. $\frac{1}{2}$ to 2 grs., dissolved in ether, and taken with old Hungary wine. It is also used externally in *psoriasis inveterata*, and other skin diseases.

Iodide of Sulphur. S_2I_2 . *Syn.* BINIODIDE OF SULPHUR; SULPHURIS IODIDUM (Ph. L.), SULPHUR IODATUM (Ph. D.), L. *Prep.* Into a glass flask put 1 part of sublimed sulphur, and over it place 4 parts of iodine; insert the cork loosely, and place the flask in a water bath; as soon as its contents melt, stir them with a glass rod, replace the cork, remove the bath from the fire, and let the whole cool together. When cold, break the iodide into pieces, and place it in a wide-mouthed stoppered bottle. In this way a beautiful semi-crystalline, dark gray mass, resembling antimony, is obtained. The formulae of the B. P., Ph. L. E. & D., Ph. U. S. & P. Cod., are essentially similar. The Ph. D. orders the two substances to be powdered and mixed before heating them.

Uses, &c. It is stimulant and alterative. An ointment made of it has been recommended by Bielt and others in tuberculous affections of the skin, in lepra, psoriasis, lupus, porrigo, &c.

Iodide of sulphur stains the skin like iodine, and is readily decomposed by contact with organic substances.

SULPHURATION. The process by which silk, cotton, and woollen goods, straw plait, &c., are subjected to the fumes of burning sulphur, or sulphurous acid, for the purpose of bleaching or decolouring them. On the large scale, this is effected in closed apartments, called 'sulphuring rooms,' to which sufficient air only is admitted to keep up the slow combustion of the sulphur. On the small scale, as for straw hats, bonnets, &c., a large wooden chest is frequently employed in the same way.

SULPHURET. *Syn.* SULPHIDE; SULPHURETUM, SULPHIDUM, L. See SULPHIDE.

SULPHURETTED HYDROGEN. See HYDROGEN.

SULPHURIC ACID. H_2SO_4 . *Syn.* OIL OF VITRIOL, BRITISH O. OF V., VITRIOLIC ACID†; ACIDUM SULPHURICUM (B. P., Ph. L. & E.), ACIDUM SULPHURICUM VERNALE (Ph. D.), ACIDUM VITRIOLICUM†, L. This acid, in a concentrated form, was discovered by Basil Valentine towards the end of the 15th century. At first it was obtained by the distillation of green vitriol; but is now made by bringing sulphurous anhydride, arising from the combustion of sulphur, into contact with the vapour of nitric acid, evolved from a mix-

ture of nitrate of soda and oil of vitriol, and of steam. The process is conducted in leaden chambers, into which steam is admitted continuously by several jets, and which have about three inches of water resting on the floor, to absorb the acid. As soon as the water, or rather liquid acid, has acquired the sp. gr. of 1.35 to 1.50, it is drawn off, and concentrated by boiling in shallow leaden pans to the density of about 1.72, after which it is further concentrated in green-glass or platinum retorts, until the sp. gr. reaches 1.842 to 1.846. When cold, the clear acid is put into large globular bottles of green glass (carbony), surrounded with straw and basket-work, and is sent into the market under the name of 'oil of vitriol.'

Purif. Commercial sulphuric acid frequently contains nitrous acid, arsenic, lead, and saline matter. The nitrous acid may be removed by adding a little sulphate of ammonia, and heating the acid to ebullition for a few minutes. Both nitric and nitrous acid are thus entirely decomposed into water and nitrogen gas. The arsenic may be got rid of by adding a little sulphide of barium to the acid, agitating the mixture well, and, after repose, decanting and distilling it. Lead, which exists as sulphate, may be separated as a white precipitate by simply diluting the acid with water. Saline matter may be removed by simple rectification. A good way of purifying oil of vitriol is to heat it nearly to the boiling-point, and pass a current of hydrochloric acid through it; the arsenic is thus carried over as the volatile chloride of arsenic, while the nitrous and nitric acids are expelled almost completely. To obtain a perfectly pure acid, it should be distilled after the removal of the nitrous acid and arsenic by the methods indicated above. "The distillation is most conveniently conducted, on the small scale, in a glass retort, containing a few platinum chips, and heated by a sand bath or gas-flame, rejecting the first $\frac{1}{4}$ fl. oz. that comes over." (Ph. E.) In the Ph. D. the first tenth of the distillate is ordered to be rejected, and the process to be stopped when no more than about 1 fl. oz. is left in the retort. According to Dr. Ure, the capacity of the retort should be from 4 to 8 times as great as the volume of the acid, and connected with a large tubular receiver by a loosely fitting glass tube, 4 feet long and 1 to 2 inches in diameter. "The receiver should not be surrounded with cold water." We find that fragments of glass, or of rock crystals, may be advantageously substituted for platinum foil, to lessen the explosive violence of the ebullition. Sulphuric acid which has become brown by exposure may be decolorised by heating it gently, the carbon of the organic substances being thus converted into carbonic acid.

Prop. Commercial sulphuric acid (oil of vitriol) is a colourless, odourless, and highly corrosive liquid, the general properties of which are well known. Its sp. gr. at 60°

should never be greater than 1.848, or less than 1.840. (Miller and Odling give the sp. gr. of the pure and concentrated acid as 1.842; Abel and Bloxam, as 1.848; Apjohn gives it as 1.846, and Hardwich about 1.845.) It is immediately coloured by contact with organic matter. It attracts water so rapidly from the atmosphere, when freely exposed to it, as to absorb 1.3rd of its weight in 24 hours, and 6 times its weight in a few months. When 3 volumes are suddenly mixed with 2 of water, the temperature of the mixture rises more than 180° Fahr. Its freezing-point appears to be about 60° below that of water (Miller and Odling give that of the rectified acid as — 30° Fahr.; Apjohn and Abel and Bloxam, — 29°). It boils at about 620° Fahr. (620.6°, Odling; 620°, Hardwich and Fownes; 617°, Apjohn; 590.6°, Abel and Bloxam). It exhibits all the properties of the acids in an exalted degree. Its salts are called sulphates.

Pur. "Free from colour and odour. Sp. gr. 1.843. 100 grs. are saturated by 285 grs. of crystallised carbonate of soda." (Ph. L.) "What remains after the acid is distilled to dryness, does not exceed $\frac{1}{100}$ th part of its weight. Diluted sulphuric acid is not discoloured by sulphuretted hydrogen." (Ph. L. 1836.) "Diluted with its own volume of water, only a scanty muddiness arises, and no orange fumes escape. Sp. gr. 1.840." (Ph. E.) The rectified acid (*ACIDUM SULPHURICUM PURUM*—Ph. E. & D.) is colourless; dilution causes no muddiness; solution of sulphate of iron shows no reddening at the line of contact when poured over it. Sp. gr. 1.845." (Ph. E.) Sp. gr. 1.846—Ph. D.; 1.843—B. P.; 1.842—Ure.

Tests.—See SULPHATE.

Uses, &c. Sulphuric acid is much employed in the arts, and, from its superior affinity, to disengage most of the other acids from their saline combinations in chemical processes. In the diluted state it is used in medicine. When swallowed, it acts as a violent corrosive poison. The antidotes are chalk, whiting, magnesia, carbonate of soda, or carbonate of potash, mixed with water, or any bland diluent, and taken freely, an emetic being also administered.

Estim. The strength of sulphuric acid is most correctly ascertained by its power of saturating bases. In commerce, it is usually determined from its sp. gr. The quantity of sulphuric acid present in a compound may be determined by weighing it under the form of sulphate, as explained in a former part of this volume. See ACIDIMETRY.

Concluding remarks. According to most of our standard works on chemistry, British oil of vitriol, when purified and brought to its maximum strength by distillation, is a definite chemical compound, having the formula H_2SO_4 , and designated normal sulphuric acid by Odling. Marignac, however, asserts that the distilled acid always contains an excess of

water, and that the true monohydrate can only be obtained by submitting fuming sulphuric acid ('Nordhausen s. a.') to congelation. According to this chemist, the true monohydrate readily freezes in cold weather, and remains solid up to 51° Fahr. Two other definite hydrates of sulphuric acid are generally recognised by chemists, viz.—Bihydrated sulphuric acid ('glacial s. a.'), having a sp. gr. of 1.78; freezing at about 40° Fahr. (47° , Miller); and boiling at about 435° (Apjohn; 401° to 410° , Odling): Terhydrated sulphuric acid, having a sp. gr. of 1.632, and the boiling-point 348° Fahr. See also NORDHAUSEN SULPHURIC ACID (*below*).

Sulphuric Acid, Al'coholised. *Syn.* ACIDUM SULPHURICUM ALCOHOLISATUM, L.; EAU DE RABEL, Fr. *Prep.* (P. Cod.) To rectified spirit, 3 parts, add, very gradually, sulphuric acid, 1 part. It is generally coloured by letting it stand over a little cochineal. Refrigerant, and, externally, escharotic.—*Dose.* $\frac{1}{2}$ fl. dr. to water, 1 pint; as a cooling drink in fevers, &c.

Sulphuric Acid, Anhydrous. SO_3 . *Syn.* SULPHURIC ANHYDRIDE, DRY SULPHURIC ACID; ACIDUM SULPHURICUM SINE AQUA, L. *Prep.* 1. By heating Nordhausen acid to about 100° Fahr. in a glass retort connected with a well-cooled receiver.

2. By distilling anhydrous bisulphate of soda, which has previously been raised to a low red heat in an earthen retort, to which a receiver is fitted without the aid of corks.

3. (Barreswill.) 2 parts of the strongest oil of vitriol are gradually added to 3 parts of anhydrous phosphoric acid, contained in a retort surrounded by a freezing mixture; when the compound has assumed a brown colour, the retort is removed from the bath, and connected with a receiver which is set there in its place; a gentle heat is now applied to it, when white vapours pass over into the receiver, and condense there under the form of beautiful silky crystals. The product equals in weight that of the phosphorus originally employed. "If a few drops of water be added, a dangerous explosion ensues."

Prop. White, silky, asbestos-like crystals, deliquescing rapidly, and fuming in the air; put into water, it hisses like a red-hot iron; it melts at 77° , and rapidly volatilises at 86° Fahr.; it does not redden dry litmus paper; sp. gr. 1.97 at 78° Fahr.

Sulphuric Acid, Aromatic. *Syn.* ELIXIR OF VITRIOL, ACID E. OF V.; ACIDUM SULPHURICUM AROMATICUM (B. P., Ph. E. & D.), L. *Prep.* 1. (Ph. E. & D.) Oil of vitriol, $3\frac{1}{2}$ fl. oz.; rectified spirit, $1\frac{1}{2}$ pint; mix, add of powdered cinnamon, $1\frac{1}{2}$ oz.; powdered ginger, 1 oz.; digest for 6 days (7 days—Ph. D.), and filter. * Sp. gr. .974—Ph. D.

2. (Wholesale.) From compound tincture of cinnamon, 1 gal.; oil of vitriol, 1 lb.; mix, and in a week filter.—*Dose.* 10 to 30 drops, in the same cases as the dilute acid.

3. (B. P.) Sulphuric acid, 3; rectified spirit, 40; cinnamon, in powder, 2; ginger, in powder, $1\frac{1}{2}$; mix the acid gradually with the spirit, add the powders, macerate for 7 days, and filter.—*Dose.* 5 to 30 minims.

Sulphuric Acid, Dilute. *Syn.* SPIRIT OF VITRIOL; ACIDUM SULPHURICUM DILUTUM (B. P., Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Take of sulphuric acid, 15 fl. drs., and dilute it gradually with distilled water, q. s. to make the whole exactly measure a pint. Sp. gr. 1.103. "1 fl. oz. of this acid is exactly saturated by 216 grs. of crystallised carbonate of soda."

2. (Ph. E.) Sulphuric acid, 1 fl. oz.; water, 13 fl. oz. Sp. gr. 1.090.

3. (Ph. D.) Pure sulphuric acid, 1 fl. oz.; distilled water, 13 oz. Sp. gr. 1.034.

4. (B. P.) Sulphuric acid, 3; distilled water, q. s. to measure $35\frac{3}{4}$; mix by adding the acid gradually to the water.—*Dose.* 4 to 20 minims.

Prop. &c. Antiseptic, tonic, and refrigerant.—*Dose.* 10 to 30 drops, largely diluted with water, several times daily; in low typhoid fevers, passive hæmorrhages, profuse perspiration, in various skin diseases to relieve the itching, in dyspepsia, &c. It is also used externally.

Sulphuric Acid, Nordhausen. *Syn.* FUMING SULPHURIC ACID; ACIDUM SULPHURICUM FUMANS, L. *Prep.* By distilling calcined ferrous sulphate ('green vitriol') in an earthen retort. The product is a brown oily liquid, which fumes in the air, is intensely corrosive, and has a sp. gr. about 1.900. When heated to about 100° Fahr., the anhydrous acid is given off, and ordinary oil of vitriol is left. According to Marignac, crystals of normal sulphuric acid (H_2SO_4) are formed in this acid when it is submitted to a low temperature. Nordhausen acid is so called from the place of its manufacture in Saxony. It may be regarded as a mixture or compound of H_2SO_4 and SO_3 . It is chiefly used for dissolving indigo.

SULPHURIC ANHYDRIDE. See ANHYDROUS SULPHURIC ACID.

SULPHURIC ETHER. See ETHER.

SULPHUROUS ACID. SO_2 . *Syn.* SULPHUROUS ANHYDRIDE; ACIDUM SULPHUROSUM, B. P. This compound is freely evolved in the gaseous form when sulphur is burnt in air or oxygen, and when the metals are digested in hot sulphuric acid; and, mixed with carbonic acid, when charcoal, chips of wood, cork, and sawdust, are treated in the same way.

Prep. 1. By the action of sulphuric acid on chippings of copper or mercury at a gentle heat. Pure.

2. (Berthier.) By heating, in a glass retort, a mixture of black oxide of manganese, 100 parts, and sulphur, 12 or 14 parts. Pure. The gas evolved should be collected over mercury, or received into water.

3. (Redwood.) Pounded charcoal, $\frac{1}{2}$ oz.;

oil of vitriol, 4 fl. oz.; mix in a retort, apply the heat of a spirit lamp, and conduct the evolved gases by means of a bent tube into a bottle containing water. The sulphurous acid is absorbed, whilst the carbonic acid gas passes off.

4. (B. P.) Distilled water, saturated with sulphurous anhydride. It is colourless and emits a pungent odour. Used as a deoxidiser, disinfectant, and antiseptic. Diluted with from 1 to 2 parts of water it is employed as a lotion for wounds, cuts, ulcers, bed-sores, scalds, and burns; with from 1 to 5 of water it is used as a gargle, also as a lotion in parasitic skin diseases; from $\frac{1}{2}$ to 1 dr., in a wine-glassful of water, 3 times a day, relieves constant sickness.

Prop., &c. Water absorbs 30 times its volume of this gas. Pure liquid sulphurous acid can only be obtained by passing the pure dry gas through a glass tube surrounded by a powerful freezing mixture. Its sp. gr. is 1.45; boiling-point, 14° Fahr.; it causes intense cold by its evaporation. Sulphurous acid forms salts called sulphites.

Uses. To bleach silks, woollens, straw, &c., and to remove vegetable stains and iron-moulds from linen. For these purposes it is prepared from sawdust or any other refuse carbonaceous matter.

Sulphurous Anhydride. See SULPHUROUS ACID.

SUM'ACH. This dye stuff is chiefly used as a substitute for galls. With a mordant of acetate of iron, it gives gray or black; with tin or acetate of alumina, yellow; and with sulphate of zinc, a yellowish-brown; alone, it gives a greenish-fawn colour.

SUMBUL. *Syn.* MUSK ROOT, JATAMANSI, SUMBUL ROOT; SUMBUL RADIX (B. P.). A substance introduced to British medicine by Dr. A. B. Granville, in 1850. It occurs in circular pieces, varying from 1 to 3 or 4 inches in diameter; has a musk-like odour, and a sweet balsamic taste. It acts as a powerful stimulant, especially of the nervous system. In India and Persia it has long been used as a medicine, a perfume, and as incense.—*Dose.* 15 grs. to 1 dr., either masticated, or made into an infusion, electuary, or tincture; in cholera, hysteria, neuralgia, epilepsy, low fevers, and various other spasmodic and nervous disorders.

SUMMER DRINKS. See LEMONADE, SHERBET, &c.

SUP'ER. See NOMENCLATURE.

SUP'PER. The evening meal; the last meal of the day. Supper is generally an unnecessary meal, and, when either heavy, or taken at a period not long before that of retiring to rest, proves nearly always injurious, preventing sound and refreshing sleep, and occasioning unpleasant dreams, nightmare, biliousness, and all the worst symptoms of imperfect digestion. The last meal of the day should be taken at least three hours before bedtime. Even when it consists of some 'trifle,'

as a sandwich or biscuit, an interval of at least an hour should elapse before retiring to rest. In this way restlessness and unpleasant dreams will become rare.

SUPPOS'ITORY. *Syn.* SUPPOSITORIUM, L. A medicine placed in the rectum for the purpose of affecting the lower intestine, or, by absorption, the system generally. Suppositories are rounded, usually, elongated masses, having the active medicine combined with some substance which will retain the proper shape, as soap, spermaceti cerate, or cacao-butter. The latter substance is, perhaps, the best vehicle for remedies prescribed in this form. It is, however, rather too soft to be used without admixture. According to Dorvaukt, the addition of one eighth part by weight of wax imparts the proper hardness. The mode of proportioning the doses of active ingredients has been noticed in the article ENEMA.

Suppository of Lead (Compound). *Syn.* SUPPOSITORIUM PLUMBI COMPOSITUM (B. P.). *Prep.* Acetate of lead, in powder, 36; opium, in powder, 12; benzoated lard, 42; white wax, 10; oil of theobroma, 80; melt the wax and oil of theobroma with a gentle heat, then add the other ingredients previously rubbed together in a mortar, and, having mixed them thoroughly, pour the mixture while it is fluid into suitable moulds of the capacity of 15 grs. The above makes 12 suppositories.

Suppository of Mercury. *Syn.* SUPPOSITORIUM HYDRARGYRI (B. P.). *Prep.* Ointment of mercury, 60 grs.; benzoated lard, 20 grs.; white wax, 20 grs.; oil of theobroma, 80 grs.; melt all but the mercurial ointment together, then add the ointment of mercury, stir till well mixed, and immediately pour into moulds of the capacity of 15 grs. The above makes 12 suppositories.

Suppository of Morphia. *Syn.* SUPPOSITORIUM MORPHIE (B. P.). *Prep.* Hydrochlorate of morphia, 6 grs.; oil of theobroma, 90 grs.; benzoated lard, 64 grs.; white wax, 20 grs.; melt the wax and oil of theobroma with a gentle heat, then add the hydrochlorate of morphia and benzoated lard, previously rubbed together in a mortar, and mix all the ingredients thoroughly; pour the mixture, while it is fluid, into suitable moulds of the capacity of 15 grs., or the fluid mixture may be allowed to cool, and then be divided into 12 equal parts, each of which should be made into a conical form.

Suppository for Piles. *Syn.* SUPPOSITORIUM HÆMORRHOIDALE, S. SEDATIVUM, L. *Prep.* 1. Powdered opium, 2 grs.; finely powdered galls, 10 grs.; spermaceti cerate, 1 dr.

2. (Ellis.) Powdered opium, 2 grs.; soap, 10 grs.; mix.

3. (Richard.) Extracts of opium and stramonium, of each, 1 gr.; cacao-butter, 2 drs. Used when the piles are very painful.

Suppository, Purgative. *Syn.* SUPPOSITORIUM CATHARTICUM, L. *Prep.* 1. Soap, 1 dr.;

elaterium, 1 to 2 grs.; mix. As a strong purge.

2. (Niemann.) Soap, 2 drs.; common salt, 1 dr.; honey, q. s.; mix. As a mild cathartic.

Suppository, Resolvent. *Syn.* SUPPOSITORIUM RESOLVENS, L. *Prep.* (Stafford.) Iodide of potassium, 3 to 4 grs.; extracts of henbane and hemlock, of each, 6 grs. In enlargement or induration of the prostate gland.

Suppository, Sedative. See above.

Suppository of Tannic Acid. *Syn.* SUPPOSITORIUM ACIDI TANNICI (B.P.). *Prep.* Tannic acid, 36 grs.; benzoated lard, 44 grs.; white wax, 10 grs.; oil of theobroma, 90 grs.; melt the wax and oil with a gentle heat, then add the tannic acid and benzoated lard, previously rubbed together, and mix thoroughly. Pour the mixture, while it is fluid, into suitable moulds of the capacity of 15 grs. The above makes 12 suppositories.

Suppository, Vermifuge. *Syn.* SUPPOSITORIUM ANTHELMINTICUM, S. VERMIFUGUM, L. *Prep.* (Swediaur.) Aloes, 4 drs.; common salt, 3 drs.; flour, 2 drs.; honey, q. s. to make a stiff mass; divide into proper-shaped pieces, weighing about 15 grs. each. One to be used after each motion.

SWALLOW. Three or four species of *hirundo* (Linn.) pass under this name. It was once held in great repute in medicine. Even the excrement was included among the simples of the Ph. L. 1618. The swallow is an insectivorous bird, but, like the sparrow and rook, is much persecuted for its good services. It has been calculated that, directly and indirectly, a single swallow is the humble means of lessening the race of one kind of insect alone to the extent of 560,970,489,000,000,000 of its race in one year.

*SWEET BALLS. *Prep.* Take of Florentine orris root, 3 oz.; cassia, 1 oz.; cloves, rhodium wood, and lavender flowers, of each, $\frac{1}{2}$ oz.; ambergris and musk, of each, 6 grs.; oil of verbena, 10 or 12 drops; beat them to a paste, form this into balls with mucilage of gum tragacanth made with rose water, pierce them, whilst soft, with a needle, and, when they are quite dry and hard, polish them. Worn in the pocket as a perfume. Some persons varnish them, but that keeps in the smell.

SWEET BAY. *Syn.* LAUREL; LAURUS NOBILIS (Linn.), L. The fruit (LAURI BACCÆ; LAURUS—Ph. L.), as well as the leaves (LAURI FOLIA), are reputed aromatic, stimulant, and narcotic. They were formerly very popular in coughs, colic, hysteria, suppressions, &c.; and, externally, in sprains, bruises, &c.

SWEET FLAG. *Syn.* ACORUS CALAMUS, L. A plant of the natural order *Orontiaceæ*. The rhizome ('root') is an aromatic stimulant, and is regarded by some as a valuable medicine in agues, and as a useful adjunct to other stimulants and bitter tonics. It is sometimes employed by the rectifiers of gin. The volatile oil obtained from it by distillation is employed

for scenting snuff, and in the preparation of aromatic vinegar.

SWEETS. Home-made wines; British wines.

SWEET BREAD. The thymus gland of the calf. When boiled, it is light and digestible; but when highly dressed and seasoned, it is improper both for dyspeptics and invalids. (Pereira.)

SWEET MEATS. Under this head are properly included confections, candies, and preserves, in sugar; but, as generally employed, the word embraces all the sweet compounds of the confectioner.

Sweetmeats, as well as cakes, blancmange, and jellies, are not unfrequently coloured with deleterious substances, the consequences of which are always pernicious, and, in many instances, have proved fatal. Gamboge, a drastic cathartic; chrome yellow, red lead, orpiment, emerald green, and various other pigments containing lead, arsenic, copper, or other poisons, have been thus employed. The whole of these may be readily detected by the tests and characteristics appended to their respective names.

The colours and stains which may be safely employed to increase the beauty of these articles are noticed under STAINS and LIQUEUR.

SWINE-POX. See Pox.

SYDENHAM'S LENTIVE. *Prep.* Take of rhubarb (recently grated or powdered), 3 drs.; tamarinds, 2 oz.; senna, $\frac{1}{2}$ oz.; coriander seeds (bruised), 2 drs.; boiling water, 1 pint; macerate for 3 hours in a covered vessel, and strain. An excellent stomachic and laxative.—*Dose.* $\frac{1}{2}$ to 1 wine-glassful.

SYLVIC ACID. *Syn.* SILVIC ACID. The portion of common resin or colophony which is the least soluble in cold and somewhat dilute alcohol.

SYMBOLS. In chemistry, are representations of one atom of each of the elementary bodies, by the capital initial letter with or without the addition of a small letter of their Latin names. As C, for carbon; Fe (*ferrum*), iron; O, oxygen, &c.

SYMPATHETIC INK. See page 643.

SYNAPTASE. *Syn.* EMULSIN. The name given by Robiquet to the EMULSIN, a nitrogenised or albuminoid principle existing in both the bitter and sweet almond. It possesses the remarkable property of converting amygdalin, in the presence of water, into hydrocyanic acid and the essential oil of bitter almonds. 100 grs. of amygdalin yield, under the influence of synaptase and water, 47 grs. of raw oil, and 5.9 grs. of anhydrous hydrocyanic acid. (Liebig.)

SYNCOPE. See FAINTING.

SYRUP. *Syn.* SIRUP, SIROP; SYRUPUS, L. A saturated, or nearly saturated, solution of sugar in water, either simple, flavoured, or medicated.

In the preparation of syrups care should be

taken to employ the best refined sugar, and either distilled water or filtered rain water; by which they will be rendered much less liable to spontaneous decomposition, and will be perfectly transparent, without the trouble of clarification. When inferior sugar is employed, clarification is always necessary. This is best done by dissolving the sugar in the water, or other aqueous menstruum, in the cold, and then beating up a little of the cold syrup with some white of egg, and an ounce or two of cold water, until the mixture froths well; this must be added to the syrup in the boiler, and the whole 'whisked up' to a good froth; heat should now be applied, and the scum which forms removed from time to time with a clean 'skimmer.' As soon as the syrup begins to slightly simmer it must be removed from the fire, and allowed to stand until it has cooled a little, when it should be again skimmed, if necessary, and then passed through clean flannel. When vegetable infusions or solutions enter into the composition of syrups, they should be rendered perfectly transparent by filtration or clarification, before being added to the sugar.

The proper quantity of sugar for syrups will, in general, be found to be 2 lbs. (avoir.) to every imperial pint of water or thin aqueous fluid. These proportions, allowing for the water that is lost by evaporation during the process, are those best calculated to produce a syrup of the proper consistence, and possessing good 'keeping qualities.' They closely correspond to those recommended by Guibourt for the production of a perfect syrup, which, he says, consists of 30 parts of sugar to 16 parts of water.

In the preparation of syrups it is of great importance to employ as little heat as possible, as a solution of sugar, even when kept at the temperature of boiling water, undergoes slow decomposition. The plan which we adopt is to pour the water (cold) over the sugar, and to allow the two to lie together for a few hours, in a covered vessel, occasionally stirring, and then to apply a gentle heat (preferably that of steam or a water bath) to finish the solution. Some persons (falsely) deem a syrup ill prepared unless it has been allowed to boil well; but if this method be adopted, the ebullition should be only of the gentlest kind ('simmering'), and should be checked after the lapse of 1 or 2 minutes.

When it is necessary to thicken a syrup by boiling, a few fragments of glass should be introduced, in order to lower the boiling-point.

To make highly transparent syrups, the sugar should be in a single lump, and, by preference, taken from the bottom or broad end of the loaf, as, when taken from the smaller end, or if it be powdered or bruised, the syrup will be more or less cloudy.

Syrups are judged, by the laboratory man, to be sufficiently boiled when some taken up in

a spoon pours out like oil, or, a drop cooled on the thumb-nail gives a proper 'thread' when touched. When a thin skin appears on blowing upon the syrup, it is judged, by the same party, to be completely saturated. These rude tests often lead to errors, which might be easily prevented by employing the proper proportions, or determining the sp. gr.

A fluid ounce of SATURATED SYRUP weighs 577½ grs.; a gallon weighs 18½ lbs. (avoir.); its sp. gr. is 1.319 to 1.321, or 35° of Baumé's aerometer; its boiling-point is 221° Fahr., and its density at the temperature of 212° is 1.260 to 1.261, or 30° Baumé. The syrups prepared with the juices of fruits, or which contain much extractive matter, as those of sarsaparilla, poppies, &c., mark about 2° or 3° more on Baumé's scale than the other syrups.

In most pharmaceutical works directions are given to completely saturate the water with sugar. Our own experience, which is extensive, leads us to disapprove of such a practice, since we find that, under all ordinary circumstances, a syrup with a very slight excess of water keeps better than one fully saturated. In the latter case a portion of sugar generally crystallises out on standing, and thus, by abstracting sugar from the remainder of the syrup, so weakens it, that it rapidly ferments and spoils. This change proceeds at a rapidity proportionate to the temperature. Saturated syrup kept in a vessel that is frequently uncorked or exposed to the air soon loses sufficient water, by evaporation from its surface, to cause the formation of minute crystals of sugar, which, falling to the bottom of the vessel, continue to increase in size at the expense of the sugar in the solution. We have seen a single 6-gallon stone bottle, in which syrup has been kept for some time, the inside of which, when broken, has been found to be entirely cased with sugar candy, amounting in weight to 16 or 18 lbs. On the other hand, syrups containing too much water also rapidly ferment, and become ascendent; but of the two, this is the less evil, and may be more easily prevented. The proportions of sugar and water given above will form an excellent syrup, provided care be taken that an undue quantity be not lost by evaporation.

The decimal part of the number denoting the sp. gr. of a syrup, multiplied by 26, gives the number of pounds of sugar it contains per gallon, very nearly. (Ure.)

In boiling syrups, if they appear likely to boil over, a little oil, or rubbing the edges of the pan with soap, will prevent it.

Syrups may be decoloured by agitation with, or filtration through, recently burnt animal charcoal. Medicated syrups should not, however, be treated in this way.

The preservation of syrups, as well as of all other saccharine solutions, is best promoted by keeping them in a moderately cool, but not a very cold, place. "Let syrups be kept in ves-

seal well closed, and in a situation where the temperature never rises above 55° Fahr." (Ph. L.) They are better kept in smaller rather than in large bottles, as the longer a bottle lasts the more frequently it will be opened, and, consequently, the more it will be exposed to the air. By bottling syrups whilst boiling hot, and immediately corking down and tying the bottles over with bladder perfectly airtight, they may be preserved, even at a summer heat, for years, without fermenting or losing their transparency.

The 'candyng,' or crystallisation, of syrup, unless it be oversaturated with sugar, may be prevented by the addition of a little acetic or citric acid (2 or 3 drs. per gal.).

The fermentation of syrups may be effectually prevented by the addition of a little sulphite of potassa or of lime. Chlorate of potassa has been proposed for this purpose by Dr. Macculloch, on theoretical grounds. M. Chereau recommends the addition of some (about 3 to 4½) sugar of milk, with the same intention. Dr. Durand asserts that by adding about 1 fl. dr. of 'Hoffmann's anodyne' to each pint of syrup, the accession of fermentation may not only be prevented, but arrested when it occurs. Fermenting syrups may be immediately restored by exposing the vessel containing them to the temperature of boiling water. The addition of a little spirit is ordered in the new 'London Pharmacopœia.'

In making the above additions to syrup, care must be had not to mix incompatible substances. Thus, in general, the two methods referred to cannot be practised together.

Syrup is, perhaps, the worst possible form of medicine, owing to the difficulty of accurately saturating it with active medicinals, and its liability to change. Few persons think that "sweetness renders a nauseous drug more palatable." See also Squire's 'Companion to the British Pharmacopœia.'

The following formulæ embrace all the syrups (SYRUP) which are official in these countries:—

Syrup of Acetate of Morphia. *Syn.* SYRUPUS MORPHIÆ ACETATIS, L. *Prep.* (Ph. D.) Solution of acetate of morphia, 1 fl. oz.; simple syrup, 15 fl. oz.; mix. Each fl. oz. contains ½ gr. of acetate.—*Dose.* ½ to 2 teaspoonfuls.

Syrup of Almond. *Syn.* BARLEY SYRUP, ORGEAT; SYRUPUS AMYGDALÆ, L.; SIROP D'ORGEAT, Fr. *Prep.* 1. Sweet almonds, 1 lb.; bitter almonds, 1 oz.; blanch, beat them to a smooth paste, and make an emulsion with barley water, 1 quart; strain, to each pint add of sugar, 2 lbs., and a table-spoonful or two of orange-flower water; put the mixture into small bottles, and preserve it in a cool place. Some persons add a little brandy.

2. (Ph. Bor.) Sweet almonds, 8 oz.; bitter almonds, 2 oz.; blanch them, after cold maceration, then beat them in a marble mortar, with a wooden pestle, to a paste, adding, gra-

dually, of water, 16 fl. oz.; orange-flower water, 3 fl. oz.; after straining through flannel, dissolve 3 lbs. of sugar in each pint of the emulsion. An agreeable pectoral and demulcent.

Syrup of Buckthorn. *Syn.* SYRUPUS RHAMNI (B. P., Ph. L. & E.); S. RHAMNI CATHARTICI, L. *Prep.* 1. (Ph. L.) Juice of buckthorn, defecated by 3 days' repose, 2 quarts; ginger and allspice, of each (bruised), 6 drs.; macerate the spice in 1 pint of the juice, at a gentle heat, for 4 hours, and filter; boil the remainder of the juice to 1½ pint, mix the liquors, dissolve therein of white sugar, 6 lbs., and add to (the nearly cold) syrup 6 fl. oz. of rectified spirit. In the Ph. E. the spirit is omitted.

2. (B. P.) Buckthorn juice, 97; ginger, sliced, 1; pimento, bruised, 1; refined sugar, 97; rectified spirit, 8 oz.; evaporate the juice to nearly half (½); add the ginger and pimento, digest at a gentle heat for four hours, and strain; when cold add the spirit, let the mixture stand for two days, then decant off the clear liquor, and in this dissolve the sugar at a gentle heat; sp. gr. 1.32.—*Dose.* 1 dr.

3. (Wholesale).—*a.* Take of buckthorn juice, 3 galls.; bruised pimento and ginger (sifted from the dust), of each, ½ lb.; simmer for 15 minutes, strain, and add of sugar, 44 lbs.

b. Take of buckthorn juice, 3 galls.; boil to 2 galls., add of bruised pimento and ginger gruffs (free from dust), of each ½ lb.; boil to 1 gal., strain, add molasses, 72 lbs., and finish the boiling.

Obs. Syrup of buckthorn is a brisk but unpleasant cathartic. It is now chiefly used in veterinary practice.—*Dose.* ½ fl. oz. to 1 fl. oz. Should the colour be dull, the addition of a few grs. of citric or tartaric acid will brighten it.

Syrup of Capillaire. *Syn.* SYRUP OF MAIDEN-HAIR; SYRUPUS ADIANTHI, SYRUPUS CAPILLORUM VENERIS, L.; CAPILLAIRE, SIROP DE CAPILLAIRE, Fr. *Prep.* (P. Cod.) Canadian maiden-hair (*Adiantum pedatum*—Linn.), 4 oz.; boiling water, 2½ pints; infuse, strain, add of white sugar, 5 lbs., and pour the boiling clarified syrup over 2 oz. more of maiden-hair; re-infuse for 2 hours, and again strain.

Obs. Demulcent. Clarified syrup flavoured with orange-flower water or curaçoa is now commonly sold for CAPILLAIRE. It is usually 'put up' in small bottles of a peculiar shape, known in the trade as 'capillaires.' It is now chiefly used to sweeten and flavour grog. See CAPILLAIRE.

Syrup of Car'ageen. *Syn.* SYRUP OF ICELAND MOSS. *Prep.* Boil horehound, 1 oz., liverwort, 6 drs., in water, 4 pints, for 15 minutes; express and strain; then add carrageen (previously softened with cold water), 6 drs.; again boil for 15 minutes, strain through flannel, and add sugar, 1 lb., to each pint. An agreeable demulcent in coughs.

Syrup of Citric Acid. *Syn.* SYRUPUS ACIDI

CITRICI (Ph. D.), L. *Prep.* (Ph. D.) Take of citric acid (in powder) and distilled water, of each, 2½ oz.; dissolve, add the solution, together with tincture of lemon peel, 5 fl. drs., to simple syrup, 3 pints, and mix with agitation. An agreeable refrigerant. Used for sweetening barley water, &c., and for flavouring water to be used as a beverage in fevers and other inflammatory diseases.

Syrup of Cochineal. *Syn.* SYRUPUS COCCINELLE, SYRUPUS COCCI (Ph. L.), L. *Prep.* (Ph. L.) Take of cochineal (bruised), 80 grs.; boiling distilled water, 1 pint; boil for 15 minutes in a closed vessel, strain, and add of sugar, 3 lbs., or twice that of the strained liquor; lastly, when the syrup has cooled, add of rectified spirit, 2½ fl. oz., or ½ fl. dr. to each fl. oz. of syrup. Used as a colouring syrup, and often sold for SYRUP OF CLOVE-PINKS.

Syrup of Colts'foot. *Syn.* SYRUPUS TUSSILAGINIS, L. *Prep.* (P. Cod.) Flowers of colts-foot, 1 lb.; (or dried flowers, 2 oz.); boiling water, 2 lbs.; macerate for 12 hours; strain, press, filter, and add of white sugar, 4 lbs. A popular remedy in coughs, colds, &c.—*Dose.* 1 to 2 table-spoonfuls, *ad libitum*.

Syrup of Cream. Finely powdered lump sugar mixed with an equal weight of fresh cream. It will keep for a long time if put into bottles, and closely corked and sealed over. It is commonly placed in 2-oz. wide-mouthed phials, and taken on long voyages, a fresh phial being opened at every meal.

Syrup, Empyrematic. Treacle.

Syrup of Ether. *Syn.* SYRUPUS ETHERIS, S. A. SULPHURICI, L.; SIROP D'ETHER, Fr. *Prep.* (P. Cod.) Sulphuric ether, 1 part; white (simple) syrup, 16 parts; place them in a glass vessel having a tap at the bottom, shake them frequently for 5 or 6 days, and then draw off the clear syrup into small bottles.—*Dose.* ½ to 3 fl. drs.

Syrup of Gin'ger. *Syn.* SYRUPUS ZINGIBERIS (B. P., Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Bruised ginger, 2½ oz.; boiling water, 1 pint; macerate for 4 hours, strain, and add of white sugar, 2½ lbs., or q. s.; and rectified spirit, as directed for syrup of cochineal. The Ph. E. omits the spirit.

2. (Ph. D.) Tincture of ginger, 1 fl. oz.; simple syrup, 7 fl. oz.; mix. Stimulant and carminative. Chiefly used as an adjuvant, in mixtures.

3. (B. P.) Strong tincture of ginger, 1; syrup, 25; mix.—*Dose.* 1 to 4 drms.

Syrup of Gum. *Syn.* SYRUPUS ACACIE, L.; SIROP DE GOMME, Fr. *Prep.* (P. Cod.) Dissolve pale and picked gum arabic in an equal weight of water, by a gentle heat, add the solution to four times its weight of simple syrup, simmer for 2 or 3 minutes, remove the scum, and cool. A pleasant demulcent. The addition of 1 or 2 fl. oz. of orange-flower water to each pint greatly improves it.

Syrup, Hive. Compound syrup of squills.

Syrup of Horehound. *Syn.* SYRUPUS MARIU, L.; SIROP DE PRASSIO, Fr. *Prep.* 1. (P. Cod.) Dried horehound, 1 oz.; horehound water, 2 lbs.; digest in a water bath for 2 hours, strain, and add of white sugar, 4 lbs.

2. White horehound (fresh), 1 lb.; boiling water, 1 gal.; infuse for 2 hours, press out the liquor, filter, and add of sugar, q. s.

Obs. A popular remedy in coughs and diseases of the lungs.—*Dose.* A table-spoonful, *ad libitum*. "It is sold for any syrup of herbs that is demanded, and which is not in the shop." (Gray.)

Syrup of Hydrochlorate of Morphia. *Syn.* SYRUP OF MURIATE OF MORPHINE, SYRUPUS MORPHIE MURIATIS (Ph. D.), L. *Prep.* (Ph. D.) Solution of muriate of morphia, 1 fl. oz.; simple syrup, 17 fl. oz.; mix. Each fl. oz. contains ½ gr. of the muriate.—*Dose.* ½ to 2 tea-spoonfuls.

Syrup of Indian Sarsaparilla. *Syn.* SYRUPUS HEMIDESMI (B. P., Ph. D.), L. *Prep.* 1. (Ph. D.) Indian sarsaparilla (*Hemidesmus Indicus*—Brown), bruised, 4 oz.; boiling water, 1 pint; infuse for 4 hours, and to the strained and defecated infusion add twice its weight of sugar. Tonic, diuretic, &c.—*Dose.* 2 to 4 fl. drs.; in nephritic complaints, and in some others, instead of sarsaparilla.

2. (B. P.) Hemidesmus, bruised, 1; refined sugar, 7; boiling distilled water, 5; infuse 4 hours, strain, add the sugar, and dissolve. The product should weigh 10½ and measure 8. Sp. gr. 1.335.—*Dose.* 1 to 4 drs.

Syrup of Iodide of Iron. *Syn.* SYRUPUS FERRI IODIDI (B. P., Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Mix iodine, 1 oz., and iron wine, 3 drs., with distilled water, 8 fl. oz., and heat the solution until it assumes a greenish colour; then strain it, evaporate it to about 4 fl. oz., and add to it of white sugar, 10 oz.; lastly, when the syrup has cooled, add as much water as may be necessary, that it may measure exactly 15 fl. oz., and keep it in a well-stoppered black glass bottle. The formulæ of the Ph. E. & D. are nearly similar, a fl. dr. of each containing about 5 grs. of the pure dry iodide. This syrup is tonic and resolvent, and hæmatinic.—*Dose.* 15 or 20 drops to 1 fl. dr.; in anæmia, debility, scrofula, &c.

2. (B. P.) Iron wire, 1; iodine, 2; refined sugar, 28; distilled water, 13. Make a syrup with the sugar and 10 of the water, and keep it hot. Put into a strong soda-water bottle, covered with a cloth, the iron wire, the iodine, and 3 of the water, shake them together until the froth of the mixture becomes white, filter whilst still hot into the syrup. The product should be made up by water to weigh 43 or to measure 31½. Sp. gr. 1.385.—*Dose.* 20 to 60 minims.

Syrup of Ipecacuanha. *Syn.* SYRUPUS IPECACUANHÆ, L. *Prep.* (Ph. E.) Ipecacuanha (in coarse powder), 4 oz.; rectified spirit, 15 fl. oz.; digest for 24 hours at a

gentle heat, and strain; add of proof spirit, 14 fl. oz., add again digest and strain, and repeat the process with water, 14 fl. oz.; distil off the spirit from the mixed liquors, evaporate to 12 fl. oz., and filter; next add to the residuum rectified spirit, 5 fl. oz., and simple syrup, 7 pints, and mix well.—*Dose.* As an emetic for infants, $\frac{1}{2}$ teaspoonful; for adults, 1 to 1½ fl. oz.; as an expectorant, 1 to 3 teaspoonfuls.

Syrup of Lem'on. *Syn.* SYRUPUS LIMONIS (B. P.), SYRUPUS LIMONUM (Ph. L. & E.), SYRUPUS CITRI MEDICE. *Prep.* 1. (Ph. L.) Lemon juice (strained or defecated), 1 pint; white sugar, 2½ lbs.; dissolve by a gentle heat, and set it aside; in 24 hours remove the scum, decant the clear portion, and add of rectified spirit, 2½ fl. oz. The Edinburgh College omits the spirit. A pleasant refrigerant syrup in fevers, &c.—*Dose.* 1 to 4 fl. drs., in any diluent. With water it forms an excellent extemporaneous lemonade.

2. (B. P.) Fresh lemon peel, 2; lemon juice, strained, 20; refined sugar, 36. Heat the lemon juice to the boiling-point, and having put it into a covered vessel with the lemon peel, let them stand until they are cold, then filter and dissolve the sugar in the filtered liquid with a gentle heat. The product should weigh 56 and measure 41.—*Dose.* 1 to 2 drs.

Syrup of Marsh-mallow. *Syn.* SYRUPUS ALTHEÆ (Ph. L. & E.), L. *Prep.* 1. (Ph. L.) Marsh-mallow root, fresh and sliced, 1½ oz.; distilled water (cold), 1 pint; macerate for 12 hours, press out the liquor, strain it through linen, and add to the strained liquor twice its weight of white sugar (about 3 lbs.); dissolve by a gentle heat, and, when cold, add of rectified spirit, 2½ fl. oz., or q. s. See SYRUP OF COCHINEAL.

2. (Ph. L. 1836.) Take of fresh marsh-mallow root, bruised, 8 oz.; water, 4 pints; boil down to one half, and express the liquor when it is cold; set it aside for 24 hours, that the faeces may subside, then decant off the clear liquid, and, having added to it of sugar, 2½ lbs., boil the whole to a proper consistence. The formula of the Ph. E. is similar.

Obs. This is a popular demulcent and pectoral.—*Dose.* 1 to 4 fl. drs.; in coughs, &c., either alone or added to mixtures.

Syrup of Mulberries. *Syn.* SYRUPUS MORI (B. P., Ph. L.), L. *Prep.* 1. (Ph. L.) Juice of mulberries, strained, 1 pint; sugar, 2½ lbs.; dissolve by a gentle heat, and set the solution by for 24 hours; then remove the scum, decant the clear liquid, and add of rectified spirit, 2½ fl. oz. Used as a colouring and flavouring, when alkalies and earths are not present. Syrup of red poppies (*rheados*), slightly acidulated with tartaric or dilute sulphuric acid, is very generally sold for it.

2. (B. P.) Mulberry juice, 20; refined sugar, 32; rectified spirit, 2½; heat the juice to the boiling-point, and, when it has cooled, filter it;

dissolve the sugar in the filtered liquid by a gentle heat, and add the spirit. The product should weigh 54. Sp. gr. 1.33.—*Dose.* 1 to 2 drs.

Syrup of Mu'riate of Morphia. See SYRUP OF HYDROCHLORATE OF MORPHINE.

Syrup of Orange Flowers. *Syn.* SYRUPUS AURANTII FLORIS (B. P.). *Prep.* Orange-flower water, 8; refined sugar, 48; distilled water, 16, or a sufficiency; heat the sugar and water together, strain, and when nearly cold add the orange-flower water. When finished should weigh 72 and measure 54. Sp. gr. 1.33.—*Dose.* 1 to 2 drs.

Syrup of Orange Peel. *Syn.* SYRUPUS AURANTII (B. P., Ph. L. E. & D.), S. CITRI AURANTII, S. à CORTICIBUS AURANTIORUM, L. *Prep.* 1. (Ph. L.) Dried orange peel, 2½ oz.; boiling distilled water, 1 pint; macerate for 12 hours in a covered vessel, press out the liquor, simmer it for 10 minutes, and then complete the process as directed for SYRUP OF COCHINEAL. In the Ph. E. & D., & Ph. L. 1836, no spirit is ordered.

2. (B. P.) Tincture of orange peel, 1; syrup, 7; mix.—*Dose.* 1 to 2 drs.

3. (Wholesale.)—*a.* From fresh orange peel, 18 oz. (or dried), $\frac{3}{4}$ lb.; sugar, 18 lbs.; water, q. s.

b. From tincture of orange peel, 1 fl. oz.; simple syrup, 19 fl. oz.; mix. An agreeable flavouring and stomachic.—*Dose.* 1 to 4 fl. drs.

Syrup of Pop'pies. *Syn.* SYRUPUS OF WHITE POPPIES; SYRUPUS PAPAVERIS (B. P., Ph. L. & E.), S. P. SOMNIFERI, L. *Prep.* 1. (B. P.) Poppy capsules, coarsely powdered, free from seeds, 36; rectified spirit, 16; refined sugar, 64; boiling distilled water, a sufficiency; macerate the poppy capsules in 80 of the water. Infuse for 24 hours, then pack in a percolator, and, adding more of the water, allow the liquor slowly to pass until 320 have been collected or the poppies are exhausted; evaporate the liquor by a water bath until it is reduced to 60; when quite cold add the spirit; let the mixture stand for 12 hours and filter. Distil off the spirit, evaporate the remaining liquor to 40, and then add the sugar. The product should weigh 104 and measure 78½. Sp. gr. 1.32.—*Dose.* 1 dr.; 10 to 20 minims for children, increasing cautiously.

2. (Ph. L.) Poppy-heads, dried, bruised, and without the seed, 3 lbs.; boiling water, 5 galls.; boil down to 2 galls., press out the liquor, evaporate the expressed liquid to 2 quarts, strain it whilst hot, and set it aside for 12 hours; next decant the clear portion from the faeces, boil this down to 1 quart, and dissolve in it sugar, 5 lbs.; lastly, when cold, add of rectified spirit; 5 fl. oz. "Each fl. oz. is equivalent to 1 gr. of dry extract." In the Ph. E. & Ph. D. 1826 no spirit is ordered.

3. (Wholesale.) Extract of poppies, 1½ lb.; boiling water, 2½ galls.; dissolve, clarify, or filter, so that it may be perfectly transparent

when cold, then add of white sugar, 44 lbs., and dissolve.

Obs. Syrup of poppies is anodyne and soporific.—*Dose.* For an infant, $\frac{1}{4}$ to $\frac{1}{2}$ teaspoonful; for an adult, 2 to 4 fl. drs. According to M. Chereau, its tendency to fermentation is prevented by the addition of 32 parts of sugar of milk to every 1000 parts of the syrup.

Syrup of Red Poppies. *Syn.* SYRUPUS RHŒADOS, (Ph. L. & E.), S. PAPAVERIS RHŒADOS, L. *Prep.* 1. (Ph. L.) Petals of the red poppy, 1 lb.; boiling water, 1 pint; mix in a water bath, remove the vessel, macerate for 12 hours, press out the liquor, and, after defecation or filtering, complete the process as directed for SYRUP OF COCHINEAL.

2. (Wholesale.) From dried red-poppy petals, 3 lbs.; boiling water, q. s.; white sugar, 44 lbs.; as the last.

Obs. Syrup of red poppies is chiefly employed for its fine red colour. A little acid brightens it. The colour is injured by contact with iron, copper, and all the common metals.

Syrup of Rhubarb. *Syn.* SYRUPUS RHEI (B. P.). *Prep.* 1. (B. P.) Rhubarb, in coarse powder, 2; coriander fruit, in powder, 2; refined sugar, 24; rectified spirit, 8; distilled water, 24; mix the rhubarb and coriander, pack them in a percolator, pass the spirit and water, previously mixed, slowly through them, evaporate the liquid that has passed until it is reduced to 18, and in this, after it has been filtered, dissolve the sugar with a gentle heat.—*Dose.* 1 to 4 drs.

2. (P. Cod.) Bruised rhubarb, 3 oz.; cold water, 16 fl. oz.; macerate for 12 hours, filter, and add of white sugar, 32 oz.

3. (Ph. U. S.) Take of rectified spirit, 8 fl. oz.; water, 24 fl. oz.; rhubarb (coarsely powdered), 2 oz.; (mixed with) sand, an equal bulk, or q. s.; make a tincture by percolation, evaporate this, over a water bath, to 13 fl. oz., and dissolve it in 2 lbs. of white sugar. An excellent formula.

4. (Wholesale.) Rhubarb (bruised), $1\frac{1}{2}$ lb.; cold water, q. s.; sugar, 20 lbs.; as No. 1. Stomachic and purgative.—*Dose.* For an infant, $\frac{1}{2}$ to 1 teaspoonful; for an adult, $\frac{1}{2}$ to $\frac{3}{4}$ fl. oz., or more.

Syrup of Rhubarb (Spiced). *Syn.* SYRUPUS RHEI AROMATICUS, L. *Prep.* (Ph. U. S.) Rhubarb, $2\frac{1}{2}$ oz.; cloves and cinnamon, of each, $\frac{1}{2}$ oz.; nutmeg, $\frac{1}{4}$ oz.; (all bruised) proof spirit, 32 fl. oz.; macerate for 14 days (or percolate), strain, gently evaporate to 16 fl. oz., filter whilst hot, and mix the liquid with simple syrup (gently warmed), $4\frac{1}{2}$ pints. A cordial laxative.—*Dose.* $\frac{1}{2}$ to 1 teaspoonful; in infantile constipation, diarrhoea, &c.

Syrup of Ros'es. *Syn.* SYRUPUS ROSÆ (Ph. L.), SYRUPUS ROSÆ CENTIFOLIÆ (Ph. E.), L. *Prep.* 1. (Ph. L.) Dried petals of damask roses (*Rosa centifolia*), 7 oz.; boiling water, 3 pints; macerate for 12 hours, filter, evaporate in a water bath to 1 quart, and add of white

sugar, 6 lbs.; and, when cold, rectified spirit, $5\frac{1}{2}$ fl. oz.

2. (Wholesale.) From rose leaves, 1 lb.; sugar, 19 lbs.; water, q. s.; as the last. Gently laxative.—*Dose.* $\frac{1}{2}$ to 1 fl. oz. It is usual to add a few drops of dilute sulphuric acid, to brighten the colour. Alkalies turn it green.

Syrup of Red Roses. *Syn.* SYRUPUS ROSÆ (B. P.), SYRUPUS ROSÆ GALLICÆ (Ph. E. & D.), L. *Prep.* 1. (Ph. E.) Dried petals of the red rose, 2 oz.; boiling water, 1 pint; pure sugar, 20 oz.; as the last.

2. (Ph. D.) Dried petals of the gallic rose, 2 oz.; boiling water, 1 pint; boil in a glass or porcelain vessel until the colour is extracted, strain with expression, and, after defecation, add to the clear decanted liquor twice its weight of white sugar. Astringent and stomachic; chiefly used as an adjunct in mixtures, &c.

3. (B. P.) Dried rose petals, 1; refined sugar, 15; boiling distilled water, 10; infuse the petals in the water 2 hours, squeeze through calico, heat the liquor to the boiling-point, and filter; add the sugar and dissolve with heat. The product should weigh 23 and measure $17\frac{1}{4}$. Sp. gr. 1.335.—*Dose.* 1 to 2 drs.

Syrup of Rue. *Syn.* SYRUPUS RUTÆ, L. *Prep.* Take of oil of rue, 12 to 15 drops; rectified spirit, $\frac{1}{2}$ fl. oz.; dissolve, and add it to simple syrup, 1 pint.—*Dose.* $\frac{1}{2}$ to 1 teaspoonful; in the flatulent colic of children. An infusion of $\frac{1}{2}$ oz. of the herb is sometimes substituted for the solution of the essential oil.

Syrup of Saffron. *Syn.* SYRUPUS CROCI (Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Hay saffron, 5 drs. (10 drs.—Ph. E.; $\frac{1}{2}$ oz.—Ph. D.); boiling water, 1 pint; macerate in a covered vessel for 12 hours, then strain the liquor, and add of white sugar, 3 lbs., or q. s., and rectified spirit, $2\frac{1}{2}$ fl. oz., or q. s., in the manner directed under SYRUP OF COCHINEAL. The Ph. E. and D. omit the spirit.

2. (Wholesale.) Hay saffron, 6 oz.; boiling water, 6 quarts; white sugar, 24 lbs.; as the last. Used for its colour and flavour; the first is very beautiful.

Syrup of Sarsaparilla. *Syn.* SYRUPUS SARSAPARILLÆ (Ph. L. & E.), SYRUPUS SARSAPARILLÆ, L. *Prep.* 1. (Ph. L.) Take of sarsaparilla (sliced), $3\frac{1}{2}$ lbs.; boil it in water, 2 galls., down to one half; pour off the liquor, and strain it whilst hot; again boil the sarsaparilla in another gal. of water down to one half, and strain; evaporate the mixed liquors to 1 quart, and in these dissolve of white sugar, 8 oz.; lastly, when the syrup has cooled, add to it of rectified spirit, 2 fl. oz.

2. (Ph. E. & Ph. L. 1836.) Sarsaparilla, sliced, 15 oz.; boiling water, 1 gal.; macerate for 24 hours, boil to 2 quarts, strain, add of sugar, 15 oz., and boil to a syrup.

3. (Wholesale.) Take of extract of sarsa-

paçilla, 3 lbs.; boiling water, 3 quarts; dissolve, strain, and add of white sugar, 12 lbs. Alternative and tonic.—*Dose.* 2 to 4 drs. See Sarsaparilla.

Syrup of Sarsaparilla (Compound). *Syn.* SYRUPUS SARZÆ COMPOSITUS, L.; SYROP DE CUSINIER, Fr. *Prep.* (Ph. U. S.) Sarsaparilla, bruised, 2 lbs.; guaiacum wood, rasped, 3 oz.; damask roses, senna, and liquorice root, bruised, of each, 2 oz.; diluted alcohol (proof spirit), 10 wine pints (1-gal. imperial); macerate for 14 days, express, filter through paper, and evaporate in a water bath to 4 wine pints ($3\frac{1}{2}$ pints, imperial); then add of white sugar, 8 lbs., and, when cold, further add of oils of sassafras and aniseed, of each, 5 drops, and oil of partridge berry (*Gaultheria procumbens*), 3 drops, previously triturated with a little of the syrup.

Obs. This is an excellent preparation; but the rose leaves might be well omitted.—*Dose.* $\frac{1}{2}$ fl. oz., 3 or 4 times a day, as an alternative, tonic, and restorative. The syrup of the P. Cod. is made with water instead of spirit, and is inferior as a remedy to the preceding.

Syrup of Senna. *Syn.* SYRUPUS SENNÆ (B. P., Ph. L. & E.), L. *Prep.* 1. (Ph. L.) Take of senna, $3\frac{1}{2}$ oz.; fennel seed (bruised), 10 drs.; boiling water, 1 pint; macerate for 6 hours, with a gentle heat; then strongly press out the liquid through linen, and dissolve in it of manna, 3 oz.; next add this solution to treacle, 3 lbs., previously evaporated over a water bath until a little of it, on being cooled, almost concretes, and stir them well together.

2. (Ph. E.) Senna, 4 oz.; boiling water, 24 fl. oz.; infuse, strain, add of treacle, 48 oz., and evaporate to a proper consistence. *Aperient.*—*Dose.* 1 to 4 drs.

3. (B. P.) Senna, broken small, 8 oz.; oil of coriander, $\frac{1}{4}$ minims; refined sugar, 12 oz.; distilled water, 50 oz., or a sufficiency; rectified spirit, 1 oz.; digest the senna in $\frac{2}{3}$ of the water twenty-four hours at a temperature of 120°, press, and strain; digest the marc in the remainder of the water six hours, press, and strain; evaporate the mixed liquors to 5 oz.; when cold add the rectified spirit containing the oil of coriander; filter, and wash the filter with water to make up 8 oz.; add the sugar, and dissolve with gentle heat. The product should weigh 21 oz. and measure 16 oz. Sp. gr. 1.310.—*Dose.* 1 to 2 drms.

Syrup, Simple. *Syn.* SYRUPUS (B. P. Ph. L.), SYRUPUS SIMPLEX (Ph. E. & D.), L. 1. (Ph. L.) White sugar, 3 lbs.; distilled water, 1 pint; dissolve by a gentle heat.

2. (Ph. E., & Ph. L. 1836.) Pure sugar, 10 lbs.; boiling water, 3 pints.

3. (Ph. D.) Refined sugar (in powder—crushed), 5 lbs.; distilled water, 1 quart.

4. (B. P.) Refined sugar, 6; distilled water, 3; dissolve the sugar in the water with the aid of heat, and when cool add water to make the product weigh 9 and measure very nearly 7. Sp. gr., 1.33.

5. (Wholesale.) Finest double refined sugar, 44 lbs.; distilled water, 2 $\frac{1}{2}$ galls.; make a syrup.

Obs. This preparation should be as white and transparent as water. *Used* as capillaire, &c., and to give cohesiveness and consistence to pulverulent substances in the preparation of electuaries, pills, &c.

Syrup of Squills. *Syn.* SYRUPUS SCILLÆ (B. P., Ph. E. & D.), L. *Prep.* 1. (Ph. E.) Vinegar of squills, 3 pints; white sugar (in powder), 7 lbs.; dissolve by a gentle heat.

2. (Ph. D.) Vinegar of squills, 8 fl. oz.; refined sugar (in powder), 1 lb.; dissolve.

3. (B. P.) Vinegar of squills, 20; refined sugar, 40; dissolve with the aid of heat.—*Dose.* $\frac{1}{2}$ to 1 dr.

4. (Wholesale.) Take of vinegar of squills (perfectly transparent), 14 lbs.; double refined sugar, 28 lbs.; dissolve in a stoneware vessel, in the cold, or at most by a very gentle heat.

Obs. This syrup, like the last, should be as clear as water, and nearly colourless.—*Dose.* 1 to 2 fl. drs., as an expectorant; in chronic coughs and asthma. In large doses it proves emetic.

Syrup of Squills (Compound). *Syn.* HIVE SYRUP; SYRUPUS SCILLÆ COMPOSITUS, L. *Prep.* (Ph. U. S.) Squills and senega, of each, bruised, 5 oz.; water, $\frac{1}{2}$ gal.; boil to a quart; add of sugar, 4 $\frac{1}{2}$ lbs.; evaporate to 3 pints, or a proper consistence, and dissolve in it, whilst hot, of potassio-tartrate of antimony (in powder), 1 dr.

Obs. This syrup is a popular expectorant in the U. S., where it is known as hive syrup.—

Dose. As an expectorant, 20 to 30 drops, for adults; for children, 5 to 10 drops; in croup, 10 drops to $\frac{1}{2}$ fl. dr., repeated until it vomits.

Syrup of Tolu. *Syn.* BALSAMIC SYRUP; SYRUPUS TOLUTANUS (B. P., Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Balsam of Tolu, 10 drs. (1 oz.—Ph. D.); boiling distilled water, 1 pint; boil in a covered vessel for $\frac{1}{2}$ an hour, frequently stirring, then cool, strain, and dissolve in the liquor sugar, 2 $\frac{1}{2}$ lbs.

2. (Ph. E.) Simple syrup (warm), 2 lbs.; tincture of Tolu, 1 oz.; mix by degrees, and agitate them briskly together in a closed vessel.

3. (B. P.) Balsam of Tolu, 1 $\frac{1}{2}$; sugar, 32; water, 20; boil the balsam half an hour, adding water when required; when cold make up to 16, filter, add the sugar, and dissolve. The product weighs 48 and measures 36. Sp. gr., 1.33.—*Dose.* 1 to 2 drs.

4. (Wholesale.) To warm water, 23 lbs., add tincture of Tolu, gradually, until it will bear no more without becoming opaque; then cork down the bottle, and occasionally agitate until cold; when quite cold, filter it through paper, and add of the finest double-refined sugar, 44 lbs.; lastly, promote the solution, in a closed vessel, by a gentle heat, in a water bath.

Obs. This syrup should be clear and colourless as water; but, as met with in the shops,

it is usually milky. It is strange that the London College should have omitted from their formula the usual addition of rectified spirit, although this syrup, perhaps more than any other, would be benefited by it.

Syrup of Tolu is pectoral and balsamic.

Syrup, Velno's Vegetable. According to Dr. Paris and Sir B. Brodie, this celebrated nostrum is prepared as follows:—Young and fresh burdock root, sliced, 2 oz.; dandelion root, 1 oz.; fresh spearmint, senna, coriander seed, and bruised liquorice root, of each, 1½ dr.; water, 1½ pint; boil down gently to a pint, strain, add of lump sugar, 1 lb., boil, to a syrup, and, lastly, add a small quantity of corrosive sublimate, previously dissolved in a little spirit. *Used* as an alterative and purifier of the blood.

Syrup of Vin'egar. *Syn.* SYRUPUS ACETI, L. *Prep.* (Ph. E.) Take of vinegar (French, in preference), 11 fl. oz.; white sugar, 14 oz.; and make a syrup.—*Dose.* 1 dr. to 1 fl. oz.; as an expectorant, in coughs and colds, or diffused through any mild diluent, as a drink in fevers. A more agreeable preparation is that of the P. Cod., made by dissolving 30 parts of sugar in 16 parts of raspberry vinegar.

Syrup of Vi'olets. *Syn.* SYRUPUS VIOLARUM, SYRUPUS VIOLE (Ph. L. & E.), L. *Prep.* 1. (Ph. L.) Macerate violet flowers, 9 oz., in boiling water, 1 pint, for twelve hours, then press, strain, and set aside the liquid, that the fæces may subside; afterwards complete the process with sugar, 3 lbs., and rectified spirit, 2½ fl. oz., (or as much of each as may be necessary,) in the way which has been ordered concerning syrup of cochineal.

2. (Ph. E.) Fresh violets, 1 lb.; boiling water, 2½ pints; infuse for 24 hours in a covered vessel of glass or earthenware, strain off the liquor (with gentle pressure), filter, and dissolve in the liquid white sugar, 7½ lbs.

3. (Wholesale.) From double-refined white sugar, 66 lbs.; 'anthokyan,' 11 lbs.; water, 22 lbs., or q. s.; dissolve in earthenware.

Uses. Syrup of violets is gently laxative.—*Dose.* For an infant, a teaspoonful.

Obs. Genuine syrup of violet has a lively violet-blue colour, is reddened by acids, turned green by alkalies, and both smells and tastes of the flowers. It is frequently *used* as a test. A spurious sort is met with in the shops, which is coloured with litmus, and slightly scented with orris root. The purest sugar, perfectly free from either acid or alkaline contamination, should alone be used in the manufacture of this syrup. The Ph. E. orders the infusion to be strained without pressure; and the P. Cod., and some other Ph., direct the flowers to be first washed in cold water.

Syrup of Worm'wood. *Syn.* SYRUPUS ABSINTHII, L.; SIROP D'ABSINTHE, Fr. *Prep.*

(P. Cod.) Tops of wormwood (dried), 1 part; boiling water, 8 parts; infuse for 12 hours, strain, with expression, and dissolve in the liquor twice its weight of sugar. Bitter, tonic, and stomachic.—*Dose.* 1 to 3 fl. drs.

TABLETTES. [Fr.] See LOZENGES and SAVONETTES.

TAFFETAS. Plasters on silk are occasionally so called. For TAFFETAS ANGLICUM, see COURT PLASTER; for TAFFETAS VESICANS, see VESICANTS.

TALC. *Syn.* FOLIATED TALC; UBERUC. A transparent, foliated, siliceous magnesian mineral, flexible, but not elastic, found in Scotland, the Tyrol, and elsewhere. It is used as a cosmetic, to impart a silky whiteness to the skin; also in the composition of *rouge végétal*, and to give a flesh-like polish to alabaster figures. A second and harder species of this mineral (FRENCH CHALK, SOAPSTONE, STEATITE; CRETA GALLICA) is employed as a crayon by carpenters, glaziers, and tailors, and forms the boot-powder of the boot-makers. Writing executed with it on glass, even after being apparently removed by friction, becomes again visible when breathed upon.

TALLOW and other fats are commonly purified by melting them along with water, passing the mixed fluids through a sieve, and letting the whole cool slowly, when a cake of cleansed fat is obtained.—Another plan is to keep the tallow melted for some time, along with about 2½ of oil of vitriol, largely diluted with water, employing constant agitation, and allowing the whole to cool slowly; then to remelt the cake with a large quantity of hot water, and to wash it well.—Another method is to blow steam for some time through the melted fat. By either this or the preceding process a white hard tallow may be obtained.—Some persons add a little nitre to the melted fat, and, afterwards, a little dilute nitric or sulphuric acid, or a solution of bisulphate of potash. Others boil the fat along with water and a little dilute nitric or chromic acid, or a mixture of bichromate of potash and sulphuric acid; and afterwards wash it thoroughly with water. These methods answer well for the tallow or mixed fats of which ordinary candles are made.

Tallow converted into stearic acid by saponification is readily hardened and bleached, if moderately pure. A mixture composed of 1 part of oxalic acid and 2000 parts of water is sufficient to bleach 1000 parts of stearic acid. The mode of operating is as follows:—Throw the stearic acid, cut into small pieces, into a vessel of cold water, and turn on steam; as soon as it has melted and assumed a turbid appearance, add the solution of oxalic acid, and boil the mixture. After boiling for ½ hour, long threads appear in the liquid; the liquid itself, which previously was of a grayish colour, becomes black, and the threads unite together. The boiling must now be discontinued, and the contents of the vessel, having been allowed to

¹ The expressed juice of violets, defecated, gently heated in earthenware to 193° Fahr., then skimmed, cooled, and filtered; a little spirit is next added, and the next day the compound is again filtered.

settle for three or four hours, must be drawn off into the coolers.

As commercial stearic acid frequently contains undecomposed tallow, as well as various foreign matters, this process is occasionally unsuccessful. To obviate the inconveniences connected with the use of this impure material, the candle may be run at two operations, as follows:—"The stearic acid, treated as above, is exposed for a month to the sun, by which means the foreign matters are oxidised, and the bleached stearic acid acquires a dirty yellow colour; the oxidised blocks are then melted in water containing a little sulphuric acid, at about 150° Fahr.; an addition of about 10 per cent. of good white wax (or spermaceti) is next made, and the whole boiled for half an hour; the white of an egg, previously beaten up in a quart of water, is then added to each 1 cwt. of stearic acid, the temperature of the mass having been reduced to 100°, or at most 120° Fahr., after which the mixture is again well stirred and boiled, when the liquid soon becomes clear, which is seen by the dark colour it assumes.

"This mixture of stearic acid and wax or spermaceti is very suitable for forming the exterior coating of the candle; it is transparent, and of perfect whiteness, and, as it is devoid of oxalic acid, it does not injure the moulds; whilst at the same time, as it is less fusible than pure stearic acid, candles made with it do not run. This first coating may be run hot without crystallising; the interior of the candle, being protected from without against too sudden a cooling, may also be run somewhat hot; by this means the candle acquires a whiteness and a transparency which cannot be realised by other processes." ("Le Moniteur Industriel.")

The sulphuric acid saponification of inferior tallow and other solid or semi-solid fatty bodies is now carried out on a very large scale for producing the cheaper varieties of 'stearine candles.' For this purpose, the tallow or fat is mixed with 5 or 6% of concentrated sulphuric acid, and exposed to a steam heat of 350° to 360° Fahr. After cooling, the black mass thus obtained crystallises to a tolerably solid fat, which is well washed once or twice with water, or high-pressure steam, and is then submitted to distillation by the aid of steam heated to about 560° Fahr. The product of the distillation is beautifully white, and may be at once used for making candles. It is better, however, to first submit it to the processes of cold and hot pressing, whereby a much more solid fat is obtained.

According to M. Pohl, palm oil or palm tallow is most easily purified by simple exposure to a high temperature, provided it has been first well defecated. When quickly heated to about 465° Fahr., and kept at that temperature for from 5 to 15 minutes, it is completely decoloured. The product has a slight empyreumatic odour, but this disappears by

age, exposure, or saponification, and the natural violet odour of the oil returns. Cast-iron pans should be employed in the process, and should be only 2-8rds filled, and well covered during the operation.

By the distillation of sulphurated palm oil in closed vessels, at a heat ranging from 570° to 600° Fahr., from 68% to 75% of a mixture of palmitic and palm-oleic acid passes over, of which 25% to 30% is colourless, hard, and crystalline, and the rest darker and softer. (Pohl.) The residuum in the still is a fine hard pitch. See CANDLES, FAT, GLYCERIN, OILS (Fixed), STEARIC ACID, &c.

TAMARA. A mixed spice used in Italian cookery, consisting of cinnamon, cloves, and corianders, of each, 2 parts; aniseed and fennel seed, of each 1 part.

TAMARIND. *Syn.* TAMARINDUS (B. P., Ph. L. E. & D.), L. The pulp or preserved fruit or pod of the *Tamarindus Indica*, or tamarind tree.

Tamarind pulp is refrigerant and gently laxative. Mixed with water, it forms a grateful acidulous drink in fevers.—*Dose.* $\frac{1}{2}$ oz. and upwards.

TANNATE. A salt of tannic acid.

TANNER'S BARK. The best of this is oak bark; but the bark of the chestnut, willow, and larch, and other trees which abound in tannin, are also used for preparing leather.

TANNIC ACID. $C_{77}H_{52}O_{47}$. *Syn.* TAN, TANNIN, GALLO-TANNIC ACID†; TANNINUM, ACIDUM TANNICUM (B. P., Ph. L. D. & U. S.), L. A peculiar vegetable principle, remarkable for its astringency and its power of converting the skins of animals into leather.

Prep. 1. (Pelouze.) From galls, in moderately fine powder, by percolation, in a closed vessel, with sulphuric ether that has been previously agitated with water. After some time the percolated liquid will be found divided into two distinct portions, the lower and heavier one being a watery solution of tannic acid, and the upper one an ethereal solution of gallic acid and colouring matter. Fresh ether must be passed through the powder as long as the lower stratum of liquid continues to augment. The two fluids are now carefully separated, and after the heavier one has been well washed with ether, it is gently evaporated to dryness, preferably under the receiver of an air-pump, or over sulphuric acid. The ether may be recovered unaltered from the ethereal solution, by cautious distillation in a retort connected with a Liebig's condenser supplied with ice-cold water. *Prod.* About 40%.

2. (Ph. D.) From galls, in tolerably fine powder, 8 oz., and a mixture of sulphuric ether, 3 pints, with water, 5 fl. oz.; by percolation, in successive portions, like the last; the aqueous solution of tannic acid being evaporated, and finally dried at a heat not exceeding 212° Fahr.

Prop., &c. Pure tannic acid is perfectly white, but as ordinarily met with it has a

slight yellowish colour, owing to the action of the air; it is uncrystallisable; possesses a powerful and purely astringent taste, without bitterness; is freely soluble in water, less so in alcohol, and only very slightly in ether; it reddens vegetable blues; when boiled with acids, it assimilates water and splits into gallic acid and grape sugar; when heated in the dry state, it suffers decomposition, metagallic and pyrogallic acids being formed; it unites with the bases, forming salts called tannates, which are characterised by striking a deep black with the persalts of iron (ink), and forming a white precipitate with gelatin.

Uses, &c. The value of substances containing tannin in the preparation of leather is well known. In its pure form it is used as an astringent in medicine; internally, in diarrhoea, hæmorrhages, as a tonic in dyspepsia, &c.; externally, made into a gargle, injection, or ointment.—*Dose.* 1 to 10 grs., in the form of pills or solution. See GALLIC ACID, &c.

TANNIN. See TANNIC ACID.

TANNING. When the skin of an animal, carefully deprived of hair, fat, and other impurities, is immersed in a dilute solution of tannic acid, the gelatin gradually combines with that substance as it penetrates inwards, forming a perfectly insoluble compound, which resists putrefaction completely; this is tanned leather. In practice, lime water is used for cleansing and preparing the skin, water acidulated with oil of vitriol for 'raising' or opening the pores, and an infusion of oak bark, or, sometimes, of catechu, or other astringent matter, as the source of tannic acid. The process itself is necessarily a slow one, as dilute solutions only can be safely used. Skins intended for the curriers, to be dressed for 'uppers,' commonly require about 3 weeks; and 'thick hides,' from 12 to 18 months.

Of late years various ingenious contrivances have been adopted, with more or less success, to hasten the process of tanning skins and hides. Among these may be mentioned the employment of stronger tan solutions, the application of a gentle heat, puncturing the skins to afford more ready access for the liquid to their interior parts, and maceration in the tan liquor under pressure, either at once or after the vessel containing them has been exhausted of air by means of an air-pump. On the merit of these several methods it has been remarked "that the saturated infusions of astringent barks contain much less extractive matter, in proportion to their tannin, than the weak infusions; and when the skins are quickly tanned in the former, common experience shows that it produces leather which is less durable than leather slowly formed." (Sir H. Davy.) "100 lbs. of skin, quickly tanned in a strong infusion of bark, produce 137 lbs. of leather; while 100 lbs., slowly tanned in a weak infusion, produce only 117½ lbs." "Leather thus highly (and hastily) charged with tannin is, moreover, so spongy as to allow moisture to pass

readily through its pores, to the great discomfort and danger of persons wearing shoes made of it." (Ure.)

According to Mr. G. Lee, much of the original gelatin of the skin is wasted in the preliminary processes to which they are subjected, more especially the 'liming' and 'bating.' He says, that 100 lbs. of perfectly dry hide, cleaned from extraneous matter, should, on chemical principles, afford at least 180 lbs. of leather.

MOROCCO LEATHER is prepared from goat or sheep skins, which, after the action of lime water and a dung bath, are slightly tanned in a bath of sumach. They are subsequently grained, polished, &c.

RUSSIA LEATHER is generally tanned with a decoction of willow bark, after which it is dyed, and curried with the empyreumatic oil of the birch tree. It is the last substance which imparts to this leather its peculiar odour and power of resisting mould and damp. See LEATHER, TANNIC ACID, TAWING, &c.

TANTALUM. *Ta. Syn. COLUMBIUM.* A rare metal discovered by Mr. Hatchett, in 1801, in a mineral from Massachusetts; and by M. Ekeberg, in 1803, in tantalite, a mineral found in Sweden. It exists in most of its ores in combination with oxygen.

TAPE-WORM. See WORMS.

TAPIOCA. *Syn. TAPIOCA* (Ph. E. & D.), L. The fecula of the root of *Janipla manihot* (*Jatropha manihot*—Linn.), which has been well washed in water, and dried on hot plates, by which it assumes the appearance of warty-looking granules.

Pure tapioca is insipid, inodorous, only slightly soluble in cold water, but entirely soluble in boiling water, forming a translucent and highly nutritious jelly. Its granules are muller-shaped, about $\frac{1}{1000}$ of an inch in diameter, and display very marked hilums. It is used in a similar manner to sago and arrow-root. See CASSAVA.

TAR. *Syn. PIX LIQUIDA* (B. P., Ph. L. E. & D.), L. A liquid bitumen prepared from the wood of *Pinus sylvestris*, and other species, by heat. The chemical constitution of tar is very complicated. Its uses in the arts are well known. As a medicine, it is stimulant, diuretic, sudorific, and vermifuge.—*Dose.* 20 to 60 minims, made into pills with flour; in ichthyosis, &c. *Externally*, in lepra, psoriasis, foul ulcers, &c. See OINTMENT and INFUSION.

Tar, Barbadoes. *Syn. PIX LIQUIDA BARBADENSIS, PETROLEUM BARBADENSE, PETROLEUM* (Ph. L. & E.), L. "Black liquid bitumen, exuding spontaneously from the earth." (Ph. L.) Its properties for the most part resemble those of the last.—*Dose.* 10 to 30 drops; in asthma, chronic coughs, tape-worm, &c. *Externally*, in chilblains, chronic, and rheumatic pains, &c. See PETROLEUM.

Tar, Coal. Produced during the distillation of bituminous coal for gas. See NAPHTHA, &c.

TAR COLOURS. *Syn.* COAL TAR COLOURS, ANILINE COLOURS, &c. Coal tar, the source of the aniline colours, consists of the oily fluid obtained in the destructive distillation of coal, during the manufacture of ordinary illuminating gas, and collected in a tank from the hydraulic main and condensers.

The composition of coal tar is highly complex, the most important constituents being, however, a series of homologous hydrocarbons obtained by distilling coal tar, and known as "coal naphtha." Naphtha, by rectification between 180° and 250° Fahr. (82 and 121 Cent.), yields a light yellow oily liquid, of sp. gr. '88, the benzol of commerce.

By the action of a mixture of nitric and sulphuric acids on benzol, nitro-benzol, a heavy oily liquid with an odour of oil of bitter almonds, is obtained. In commerce this substance is made in large cast iron-pots, fitted with tight covers, and provided with stirrers worked by steam power. By means of pipes the reagents are admitted and the nitrous fumes are carried off, while the nitro-benzol and the spent reagents are drawn off from the bottom. The entire charge of benzol is first placed into the vessels, and the mixed acids are, as the reaction is very energetic, cautiously run in, the whole being well stirred throughout. When finished, the contents are drawn off, and the nitro-benzol collected, washed with water, and, if necessary, neutralised with a solution of soda.

Nitro-benzol is converted into aniline in a similar apparatus, only provided with means of admitting a current of superheated steam, and condensing the aniline as it distils over. Into the vessel iron borings are placed, and acetic acid and nitro-benzol cautiously run in as the reduction is violent, stirring well all the time. A current of superheated steam is passed through, and the aniline collected as it distils over, as a pale sherry coloured oily liquid boiling at 360° Fahr. (182 Cent.), and of sp. gr. 1·02.

MAUVE, the first-discovered coal tar, or aniline colour, was obtained by Mr. Perkins during some experiments directed towards the artificial formation of quinine, and was also first practically manufactured by Mr. Perkins. Commercially, mauve is made as follows:—

Aniline and sulphuric acid in proper proportions are dissolved in water in a vat by aid of heat, and when cold a solution of bichromate of potassium added, and the whole allowed to stand a day or two, when a black precipitate is obtained, which, after collecting on shallow filters, is washed and well dried. This black resinous substance is digested with dilute methylated spirit in a suitable apparatus, to dissolve out the mauve, and the major portion of the spirit distilled off. The mauve is precipitated from the aqueous solution left behind by hydrate of sodium, and after washing is either drained to a paste or dried.

The amount of mauve thus obtained is but

small in comparison with the raw material, coal tar, as 100 lbs. of coal yield 10 lbs. 12 oz. of coal tar; 8½ oz. of mineral naphtha, 2½ oz. of benzol; 4¼ oz. of nitro-benzol, 2¼ oz. of aniline, and ¼ oz. of mauve. Mauve is usually sent into the market in paste or solution, the expense of the crystals being heavy, and offering no corresponding advantages.

Other salts than the bichromate of potassium have been employed to convert aniline into mauve, as chloride of copper, permanganate of potassium, &c.; but experience has shown none to possess the same advantages as the bichromate of potassium.

MAUVEINE, the organic base of mauve or aniline purple, is a black crystalline powder, of the formula $C_{20}H_{19}N_3$, yielding a dull violet solution. The moment, however, mauveine is brought in contact with an acid, it turns a magnificent purple colour. The salts of mauveine form beautiful crystals possessing a splendid green metallic lustre, soluble very readily in alcohol, and less so in water. The commercial salt, or mauve, is the acetate, or sometimes the hydrochlorate.

MAGENTA. *Syn.* ANILINE RED, ROSEINE, FUCHSINE, &c., is prepared from commercial aniline by the action of arsenic acid; the process being carried out in cast-iron pots of proper construction, placed over a furnace. Into these pots are placed 2 parts of commercial aniline containing 25 per cent. of toluidine, and 3 parts of a saturated solution of arsenic acid; the whole is well stirred, heated for a proper period, and the excess of aniline driven off by a current of superheated steam. The crude product obtained is transferred to vats, boiled with water and filtered; common salt added to the filtrate, and the precipitated magenta collected, redissolved in boiling water, refiltered, and crystallised.

This after-recrystallisation constitutes commercial magenta. Magenta consists of brilliant large crystals, having a beautiful golden-green metallic lustre, and soluble in water to an intense purplish-red solution. It is a salt of a colourless base, rosaniline, which is prepared from magenta by boiling with hydrate of potassium, and allowing the solution to cool, when it crystallises out in colourless crystals, having the formula $C_{20}H_{19}N_3H_3O$. All the salts of rosaniline have splendid purple-red colour, and that usually met with as magenta is the hydrochlorate, although the nitrate, oxalate, and acetate are also to be obtained.

From magenta or hydrochlorate of rosaniline a large number of colouring matters are produced, the most important of which will be briefly described below.

ANILINE BLUE, or BLEU DE LYONS. This dye is prepared by heating a mixture of magenta, acetate of sodium and aniline in iron pots, provided with stirrers, &c., in an oil bath, to 374° Fahr. (190° C.), and the excess of aniline distilled over. When a good blue has been obtained, the heat is removed, and the

thick treacly fluid purified. This is effected for the commoner varieties by treating the crude product with hydrochloric acid to dissolve all the excess of aniline, and the various red and purple impurities; but for the better qualities by mixing the crude product with methylated spirit, and pouring the whole into water acidulated with hydrochloric acid, and then thoroughly washing the colouring matter that is precipitated, with water and drying.

This blue, like magenta, is a salt of a colourless base, which has been named Triphenylrosaniline, $C_{35}H_{31}N_3$, or $C_{30}H_{16}(C_6H_5)_3N_3$. Aniline blue, or Lyons blue, is sent into the market either as a coarse powder of a coppery lustre, or in alcoholic solution; as it is insoluble in water, which necessitates it being added to the dye bath in solution in spirit, a great drawback.

Mr. Nicholson, by treating Lyons blue in the same manner as indigo is converted into sulphinidigotic acid, has succeeded in rendering it soluble; dissolving in alkalis to form colourless salts, and decomposed by acids into its original blue colour.

By a modification of this method, "NICHOLSON BLUE" is prepared a fine soluble blue dye. Another colouring matter called Paris blue or bleu de Paris, was obtained by heating stannic chloride with aniline for 30 hours at a temperature of 356° Fahr. (180° C.). It is a fine pure blue, soluble in water, and crystallising in large blue needles with a coppery lustre.

VIOLET IMPERIAL. If the action of the aniline and magenta in the process of manufacturing aniline blue be stopped before it is finished, and the resulting product treated with dilute acid, a colouring matter called violet imperial is obtained. It is now, however, replaced by the Hoffmann violets.

HOFFMANN VIOLETS. On a large scale these violets are produced in deep cast-iron pots, surrounded by a steam jacket, and provided with a lid, having a perforation for distilling over the excess of reagents.

These vessels are charged with a solution of magenta in methylated or wood spirit, and iodide of ethyl or methyl, in proportions according to the shade required, and the whole heated by steam for five or six hours, when the excess of alcohol and iodide of ethyl is distilled over. The resulting product is dissolved in water, filtered, precipitated with common salt, and well washed.

Like most of the other colours, Hoffmann violets are salts of colourless bases. That of a red shade has a formula of $C_{22}H_{23}N_3$, or $C_{20}H_{13}(C_2H_5)_2N_3$; of a true violet shade, $C_{24}H_{27}N_3$, or $C_{20}H_{17}(C_2H_5)_2N_3$; and of a blue shade of violet, of $C_{26}H_{31}N_3$, or $C_{20}H_{16}(C_2H_5)_3N_3$. They are all moderately fast on wool and silk, although less so on cotton, and, as they can be produced in nearly every shade of violet, are in great use, having replaced most of the other violets.

DALLIA. This is prepared from mauve and iodide of ethyl, in the same manner as the Hoffmann violets, and is a purple-red violet. It is a good colour, but the expense precludes its general use.

BRITANNIA VIOLET. This is obtained in the same manner as the Hoffmann violets, by acting on an alcoholic solution of magenta, with a thick, viscid, oily fluid of the formula $C_{10}H_{15}Br_3$, obtained by cautiously acting with bromine on oil of turpentine. It is a beautiful violet, capable of being manufactured of every shade, from purple to blue, and most extensively used.

ALDEHYDE GREEN. Prepared by dissolving one part of magenta in three parts of sulphuric acid, diluted with one part of water, adding by degrees one and a half part of aldehyde, and heating the whole on a water bath until a drop put in water turns a fine blue. It is then poured into a large quantity of hot water containing three parts of hyposulphite of sodium, boiled and filtered. The filtrate contains the green, which can either be kept in solution or be precipitated by means of tannic acid or acetate of sodium. Like the other colours, this green is a salt of a colourless base, containing sulphur, the formula of which is not known, and is principally used for dyeing silk, being very brilliant in both day and artificial light.

IODIDE GREEN. Produced during the manufacture of the Hoffmann colours, and is now used for dyeing cotton and silk; its colour being bluer than that of aldehyde green, it is more useful. Iodide green, not being precipitated by carbonate of sodium, is usually sold in alcoholic solution.

PERKINS' GREEN. This is also a magenta derivative, and a salt of a powerful colourless base. It resembles the iodide green, but is precipitated by alkaline carbonates and picric acid. This colour is used chiefly for calico printing, and is quite as fast as the Hoffmann colours.

Besides the above products obtained from aniline, a series of colours have been obtained from phenol, or carbolic acid, another substance obtained from coal tar.

PICRIC ACID. This is obtained by treating in a suitable apparatus, with proper precautions, carbolic acid with nitric acid. It is a pale yellow crystalline acid, forming dark orange explosive salts, and dyeing silk a fine yellow.

ISOPICRATE OF POTASSIUM. By treating picric acid with cyanide of potassium a very explosive salt is obtained, used to dye wool a dark maroon colour.

AURINE, or ROSOLIO ACID. This is obtained by heating a mixture of sulphuric, oxalic, and carbolic acids, and purifying the products. It is a beautiful reddish, resinous substance, with a pale green lustre, and yielding an orange coloured solution, changed by alkalis to a splendid crimson. Owing to the

difficulty in using it, however, it is not very extensively employed.

PEONINE, or **CORALLINE**. This dye is formed when rosolic acid and ammonia are heated to between 248° and 284° Fahr. (120° to 140° C.). It is a fine crimson dye, forming shades similar to safflower on silk, but, owing to the bad effects of acids, not much used.

AZULINE. Prepared by heating coralline and aniline together. A coppery coloured resinous substance, soluble in alcohol, and with difficulty in water, and dyeing silk a blue colour. The aniline blues, however, have superseded it to a great extent.

There are other substances obtained from coal tar that have been employed to form dyes, but of which we shall only refer to one—naphthaline. By treating this in exactly the same manner as benzol is converted into aniline, a solid crystalline white base, termed naphthylamine, is produced. From this substance is obtained the following dye.

DINITRONAPHTHAL, or **MANCHESTER YELLOW**. Naphthylamine is converted into diazyl-naphthol by treatment with nitrite of potassium, and the latter, when heated with nitric acid, yields the colour. It is a weak acid, and the salt employed in commerce is the beautiful yellow crystalline calcium salt which dyes silk and wool a magnificent golden-yellow colour.

TARAXACUM. See DANDELION.

TARPAULIN. *Syn.* **TARPAWLING**. Canvas covered with tar or any composition to render it waterproof.

TARTRAS. *Syn.* **TERRAS**. A volcanic product resembling puzzolano, that imparts to mortar the property of hardening under water. Several other argillo-ferruginous minerals possess the same power, and are used under this term.

TARTAR. *Syn.* **ARGAL**, **ORGOL**; **TARTARUM**, **TARTARUS**, *L.* Impure bitartrate of potassa. Crude tartar is the concrete deposit formed upon the sides of the casks and vats during the fermentation of grape juice. That obtained from white wine is white argol; that from red wine, red argol. After purification it forms cream of tartar.

Tartar, Ammoniated. *Syn.* **AMMONIO-TARTRATE OF POTASSA**, **SOLUBLE TARTAR** (**Ammoniated**); **TARTARUS AMMONIATUS**, **TARTARUM SOLUBILE AMMONIATUM**, *L.* *Prep.* Neutralise a solution of cream of tartar with ammonia in slight excess, then evaporate, and crystallise. Very soluble in water. A favourite laxative on the Continent.

Tartar, Boraxated. *Syn.* **SOLUBLE CREAM OF TARTAR**, **BORO-TARTRATE OF POTASSA AND SODA**; **TARTARUM BORAXATUM**, **CREMOR TARTARI SOLUBILIS**, **POTASSE ET SODÆ TARTRAS BORAXATA**, *L.* *Prep.* From borax, 2 lbs.; cream of tartar, 5 lbs.; (both in powder); dissolved in water, evaporated, and crystallised. See **BOROTARTRATE OF POTASSA**.

Tartar, Chalybeated. Potassio-tartrate of iron.

Tartar, Cream of. Bitartrate of potassa.

Tartar, Emetic. Potassio-tartrate of antimony.

Tartar, Oil of. Deliquesced carbonate of potassa.

Tartar, Reduced. *Syn.* **CREMOR TARTARI REDUCTUS**, *L.* An article is sold, under the name of 'British cream of tartar,' which contains $\frac{1}{4}$ its weight or more of bisulphate of potassa.

Tartar, Salt of. Carbonate of potassa.

Tartar, Soluble. Neutral tartrate of potassa.

Tartar, Spirit of. Pyrotartaric acid.

TARTARIC ACID. $H_2C_4H_2O_6$. *Syn.* **ACID OF TARTAR**, **ESSENTIAL SALT OF T.**; **ACIDUM TARTARICUM** (**B. P.**, **Ph. L. E. & D.**), **SAL ESSENTIALE TARTARI**, *L.* *Prep.* 1. (**Ph. L.** 1836.) Take of cream of tartar, 4 lbs.; boiling water, 2 galls.; dissolve by boiling; add, gradually, of prepared chalk, 12 oz. 7 drs. (made into a milk with water), and, when the effervescence ceases, add another like portion of prepared chalk, dissolved in hydrochloric acid, 26½ fl. oz., or q. s., diluted with water, 4 pints; collect the precipitate ('tartrate of lime'), and, after well washing it with water, boil it for 15 minutes in dilute sulphuric acid, 7 pints and 17 fl. oz.; next filter, evaporate the filtrate (to the density of 1.38), and set it aside to crystallise; redissolve the crystals in water, concentrate the solution by evaporation, and recrystallise a second and a third time. The Edinburgh formula is nearly similar. In the **Ph. L. & D.** tartaric acid is placed in the *Materia Medica*.

2. (*Gatty*.) The solution of argol or tartar is first neutralised with carbonate of potassa, and to every 300 galls. of the clear liquid, at 5° Twaddell, 34 galls. of milk of lime (1 lb. of lime per gall.) are added; carbonic acid gas is then forced in, with agitation; decomposition ensues, with the formation of 'bicarbonate of potassa' and 'tartrate of lime'; the last is converted into tartaric acid in the usual manner, and the former is evaporated in iron pans, and roasted in a reverberatory furnace for its potassa.

Prop. Tartaric acid forms inodorous, scarcely transparent, oblique rhombic prisms, more or less modified, which are permanent in the air; it possesses a purely sour taste, dissolves in about 2 parts of water at 60° Fahr., and in about its own weight of boiling water; it is slightly soluble in alcohol; the aqueous solution exhibits right-handed polarisation, and suffers gradual decomposition by age.

It is free from colour; is entirely, or almost entirely, dissipated by ignition; and is entirely soluble in water.

Tests. 1. Tartaric acid is known to be such by its solution giving white precipitates with solutions of caustic lime, baryta, and strontia, which dissolve in excess of the acid.—

2. A solution of potassa causes a white granular precipitate of cream of tartar,

soluble by agitation in excess of the precipitant.—3. Nitrate of silver and acetate of lead give white precipitates, which, when heated, fume, and yield the pure metal.—4. If to a solution of tartaric acid, or a tartrate, solution of a ferric or aluminum salt, be added, and subsequently ammonia or potassa, no precipitate is formed.—5. At about 570° Fahr. all the tartrates are blackened, and yield a peculiar and characteristic odour.

Uses, &c. Tartaric acid is chiefly employed in calico printing, and, in medicine, as a substitute for citric acid and lemon juice in the preparation of cooling drinks and saline draughts. For the latter purpose, bicarbonate of soda is the alkaline salt commonly employed.—**Dose.** 10 to 30 grains.

Concluding remarks. On the large scale the decomposition of the tartar is usually effected in a copper boiler, and that of the tartrate of lime in a leaden cistern. This part of the process is often performed by mere digestion for a few days, without the application of heat. Lead or stoneware vessels are used as crystallisers. Good cream of tartar requires 26% of chalk and 28½% of dry chloride of calcium for its perfect decomposition. Dry tartrate of lime requires 75% of oil of vitriol to liberate the whole of its tartaric acid. A very slight excess of sulphuric acid may be safely, nay, advantageously, employed. Some manufacturers bleach the coloured solution of the first crystals, by treating it with animal charcoal; but for this purpose the latter substance should be first purified by digesting it in Hydrochloric acid, and afterwards by edulcorating it with water, and exposing it to a dull red heat in a covered vessel. The general management of this manufacture resembles that of citric acid. To obtain a large product, care must be taken that the whole of the tartrate of lime be thoroughly decomposed, a matter not always effected by clumsy manipulators, who do not adapt their quantities or practice to the circumstances before them.

TARTRATE. A salt of tartaric acid.

TARTS. These may be regarded as miniature pies, consisting of fruit, either fresh or preserved, baked or spread on puff-paste.

TAURIN. $C_2H_5NSO_3$. Obtained when purified bile is boiled for some hours with an excess of hydrochloric acid. By filtration, evaporation, and dissolving the dry residuum in about 6 parts of boiling alcohol, nearly pure taurin crystallises out as the solution cools. It forms with crystalline needles, which are soluble in water, and sparingly soluble in alcohol. It is remarkable for containing fully 25% of sulphur.

TAUROCHOLALIC ACID. See CHOLEIC ACID.

TAWING. In the preparation of the TAWED LEATHER used for gloves, housings, &c., the skins are first soaked, scraped, and hung in a warm room until they begin to exhale an

ammoniacal odour, and the wool readily comes off; they are then de-haired, and soaked in water with some quicklime for several weeks, the water being changed two or three times during that period; they are then again beamed, smoothed, and trimmed, after which they are rinsed, and resoaked in a vat of bran-and-water, where they are kept in a state of gentle fermentation for some weeks; (in this state they are called 'pelts'); the skins are next well worked about in a warm solution of alum and salt, again fermented in bran-and-water for a short time, and are then stretched on hooks, and dried in a stove-room; they are, lastly, again soaked in water and trodden or worked in a pail or tub containing some yolks of eggs beaten to a froth with water, after which they are stretched and dried in a loft, and are smoothed with a warm smoothing-iron. Sometimes the process is shortened by soaking the skins in the following mixture after the first steep with bran:—Common salt, 3½ lbs.; alum, 8 lbs.; boiling water, q. s.; dissolve, add of wheaten flour, 21 lbs.; yolks of 9 dozen eggs; make a paste. For use, a portion is to be largely diluted with water.

CHAMOIS or SHAMMY LEATHER is generally prepared from either sheep or doe-skins, which, after dressing, liming, &c., are well oiled on the grain side, then rolled into balls, and thrown into the trough of the fulling-mill, where they are beaten for 2, 3, or 4 hours. They are next aired, and again oiled and fulled, and this is repeated a third time, or oftener, as circumstances may direct. The oiled skins are then exposed to a fermenting process, or heating in a close chamber, and are afterwards freed from redundant oil by being scoured in a weak alkaline lye. They are, lastly, rinsed in clean water, wrung at the peg, dried, and 'finished' at the stretcher-iron.

TAWED LEATHER differs from **TANNED LEATHER** in yielding size or glue under the influence of heat and moisture, in nearly the same way as the raw skins.

TEA. *Syn.* **THEA, L.** The dried leaves of the Chinese tea plants (*Thea Bohea* and *Thea viridis*.)

It was formerly supposed that **BLACK TEAS** could only be obtained from *T. Bohea*, and **GREEN TEAS** from *T. viridis*, but Fortune and others have proved that both sorts may be made from either species, and that the differences in colour and flavour depend chiefly on the age of the leaves and the treatment they undergo in the drying process. Another species, named *Thea Assamica*, furnishes **ASSAM TEA**.

Pur. The only adulteration of tea which is extensively practised at the present day is mixing it with a certain portion of exhausted tea-leaves, which have been redried and curled. The collection and preparation of these occupy several hundred persons, chiefly women and children, in and about London. The leaves which have been found in the possession of the

manufacturers of imitation tea are those of the sloe tree, ash tree, elder bush, and white thorn. According to Mr. Warrington, a most extensive system of adulterating tea is practised in China. Many samples directly imported from that country, examined by him, did not contain a single grain of tea, being made up entirely of other leaves. The ordinary green teas he found, for the most part, spurious, being manufactured out of the cheaper black teas. These are 'faced up' or 'painted' with various colouring substances, powdered porcelain clay, &c., which are readily perceived under the microscope, and even admit of being separated, and chemically examined.

It is a general practice among the grocers in this country to impart what they call a 'bloom' to their green teas by 'rouncing' them up with a little calcined magnesia, or finely powdered talc or French chalk. The quantity that adheres to the tea is very trifling, but it greatly improves its appearance. Black teas are 'faced,' in a similar manner, with finely powdered plumbago or black-lead.

Pure China tea is not turned black by being put into water impregnated with sulphuretted hydrogen gas, nor does it tinge a solution of ammonia blue. The infusion is amber-coloured, and is not reddened by the addition of an acid. The ashes left from the combustion of genuine tea are white, and do not exceed 5 to 5½ %. If they exceed this they may be chemically examined with the usual tests for alumina, chromate of lead, copper, cyanide of potassium, gypsum, lime, magnesia, &c. Many of these substances may be detected by simply agitating the tea with a little cold water, when they will be detached from its surface, and render the water turbid, or, by their gravity, sink to the bottom.

Among domestic substitutes for tea are—the leaves of speedwell, wild germander, black currant, syringa or mock orange, purple-spiked willow herb, winter green, sweetbriar, cherry tree, sloe, &c., all of which are used for tea, either singly or mixed. The addition of a single bud of the black currant to the infusion of ordinary black tea imparts to it a flavour closely resembling that of green tea.

The brownish-coloured powder vendred under the name of 'la veno beno' is a mixture of 2 parts of tea-dust with 5 parts of powdered catechu or *terru japonica*. A few grains of this substance thrown into the teapot are described in the advertisements as being capable of more than doubling the strength of the beverage.

The once notorious 'PARAGUAY PLANT,' sold in packets, was simply new meadow-lay that had been wetted with a strong infusion of catechu, then dried, chopped small, and strongly compressed. See THEINE and CAFFEINE.

Tea. "The tea is not a meal; when it is properly used, it should not be a meal; but it

has a special purpose to fulfil, which I will now explain. Tea—and under the generic term tea I include coffee—tea is usually taken three hours after dinner. This is the moment which corresponds with the completion of digestion, when, the food having been conveyed away from the stomach, nothing remains behind but the excess of the acid juices employed in digestion; these acid juices create an uneasy sensation at the stomach, and a call is made for something to relieve the uneasiness; 'a fulfils that object.' "On the same principle, after the business of the dining-room, the antacid and refreshing beverage, either in the shape of tea or coffee, is prepared in the drawing-room. In taking either, the nearer they approach to the simple infusion the better; little milk or cream, and less sugar, should be the principle. But, seeing the purpose of tea, how unreasonable to make it the excuse for a meal, to conjoin with it toast, muffins, bread and butter, and *id genus omne*." "Three meals a day may be taken as the standard of habit and custom; tea and coffee having a specific place and purpose as a beverage, but none as a meal." (Eras. Wilson.) See MEALS, &c.

Tea, Beef. *Syn.* INFUSUM CARNIS BUBULÆ, JUSCULUM CUM CARNE BOVIS, L. This is merely a very concentrated soup formed of lean beef. According to the common plan, lean beef, 1 lb., is gently simmered in water, 1 quart, for about ½ an hour, when spices, salt, &c., are added, and in a few minutes the whole is strained for use. The following are other formulæ:—

1. (Dr. A.T. Thomson.) Take of good rump steak, ½ lb.; cut it into thin slices, spread these over a hollow dish, sprinkle a little salt on them, add a pint of boiling water, and place the dish (covered) near the fire for ½ an hour; then remove the whole to a saucepan, and boil it gently for 15 minutes; lastly, strain through a hair sieve.

2. (Prof. Liebig.) Beef, free from fat, 1 lb., is to be minced very small, mixed with an equal weight of cold water, and, after digestion and agitation in the cold for about ½ an hour, heated slowly to boiling; when it has boiled for a minute or two, strain it through a cloth. It may be coloured with roasted onion or burnt sugar, and spiced and salted to taste.

Obs. Similar preparations are ordered in some foreign Pharmacopœias from calves' lights, crayfish, frogs, mutton, pullets, snails, tortoise, veal, &c. In the Ph. L. 1746 a form was given for viper broth (JUSCULUM VIPERINUM). See ESSENCE OF BEEF, EXTRACT OF MEAT, &c.

TEETH (The). *Syn.* DENTES, L. An object very subservient to health, and which merits due attention, is the preservation of the teeth; the care of which, considering their importance in preparing the food for digestion, is, in general, far from being sufficiently appreciated. Comparatively very few persons wash their mouth and clean their teeth even

once a day; a feat which ought always to be practised at the conclusion of a meal, when either animal food or vegetables are eaten; for the first is apt to leave behind it a rancid acrimony, and the other an acidity, both of them hurtful to the teeth. Those who abhor a fetid breath, rotten teeth, and the tooth-ache, would do well to invariably clean their teeth before retiring to rest. With smokers, this practice is almost obligatory. Washing the mouth frequently with cold water is not only serviceable in keeping the teeth clean, but in strengthening the gums, the firm adhesion of which to the teeth, is of the greatest importance in preserving them sound and secure. Some persons think it serviceable to add a few drops of spirit or essence of camphor to the water thus employed, a plan we certainly approve of. See BREATH, DENTIFRICES, PASTES, POWDERS, TOOTH CEMENTS, WASHES, &c.

TEETHING. *Syn.* DENTITION. Children are sometimes born with one or more teeth; but, in general, the teeth, at birth, consist of mere pulpy rudiments buried in the gum. Their development is gradual. About the third or fourth month they begin to assume shape and hardness. At this period children become fretful, the saliva flows copiously, the gums grow turgid, and there is a fondness of biting hard cold objects. In nearly all cases there is more or less fever, frequently a cough or diarrhoea, and a rash commonly appears, which is called by nurses the 'red gum.' These symptoms generally abate after a fortnight or three weeks, and the child remains undisturbed until the seventh or eighth month. About this period the gums again become red, tender, and swollen, and often extremely sensitive, and painful. The upper part of the gum gradually becomes attenuated and pale, and, just before the tooth appears, even covered with a blister. These changes are usually attended by an increased flow of saliva, or 'driveling,' and a lax state of the bowels, both of which are regarded as favorable symptoms. Sometimes, however, the diarrhoea is excessive, when it may be cautiously restrained by a dose or two of rhubarb and magnesia, with a little dill or peppermint water; or, better, by the daily use of a little arrow-root, to which a few drops of pure port wine may be added. Sometimes the local irritation is considerable, or there are spasms or convulsions, in which case the practice is to lance the gums. When there is drowsiness, stupor, or oppressed respiration, one or two leeches may be applied to the temples, and a small blister to the back of the neck, or behind the ear. Sluggishness of the bowels may be removed by a little castor oil; or, when there is actual constipation, by a little calomel or mercurial powder and rhubarb. Excessive irritability, without other marked symptoms, is best combated by a drop or two of tincture of hops in sweetened water. Throughout the

whole period of dentition the use of warm dry clothing, freedom from tight bandages, with thorough ventilation, good nursing, exercise, fresh air without undue exposure, abundance of crawling on the carpet, and frequent warm baths, will be found most advantageous. Indeed, the last, without other treatment, are often sufficient to subdue the most distressing convulsions and the most obstinate diarrhoea, and in no case can they do harm. See NURSING, STROPHULUS, &c.

TELLU'R'IUM. A rare grayish-white elementary substance, found only in small quantities, associated with gold, silver, lead, and bismuth, in the gold mines of Transylvania. It has often been described as a metal, but is now commonly classed with the metalloids.

TEMPERATURE. In English pharmacy it is customary to measure the degree of heat by Fahrenheit's thermometer. When a boiling heat is directed, 212° is meant. A gentle heat is that which is denoted by any degree between 90° and 100° Fahr.

Whenever specific gravity is mentioned, the substance spoken of is supposed to be of the temperature of 62° Fahr. (Ph. L.)

In the B. P., Ph. E. & D., and in chemical works in this country generally, the specific gravities of bodies are taken at, or referred to, the temperature of 60° Fahr. See THERMOMETERS.

TENT. A piece of lint, or compressed sponge, used to dilate openings, wounds, &c.

TERBIUM. A rare metal found by Prof. Mosander, associated with erbium and yttrium in ordinary yttria. See ERBIUM and YTTRIA.

TER'RA. [L.] Earth. **TERRA JAPONICA,** catechu; **TERRA PONDEROSA,** sulphate of baryta, &c.

TER'RA COT'TA. Literally, baked clay; a term applied to statues, architectural ornaments, &c., made of pure white clay, fine sand, and powdered potsherds, slowly dried, and baked to a strong hardness.

TEST. *Syn.* REAGENT. Any substance employed to determine the name or character of any other substance, or to detect its presence in compounds.

TET'ANUS. Spasm with rigidity. When it affects the under jaw, it is called TRISMUS, or locked-jaw; when the body is drawn backward by the contraction of the muscles, it is called OPISTHOTONOS; when the body is bent forward, EMPROSTHOTONOS; and when the body is drawn to one side, PLEUROSTHOTONOS.

The cause of tetanus, in temperate climates, is generally irritation of the nerves, arising from local injuries, especially punctured or lacerated wounds. Of these the most trivial are occasionally sufficient to produce locked-jaw. In hot climates the disease is occasionally produced by exposure to cold, or by suddenly suppressed perspiration. The last variety is curable; the former one, scarcely ever so. The proper treatment is a matter still undeter-

mined. Sedatives, antispasmodics, and powerful stimulants, have each had their advocates. Large doses of wine and spirits, in conjunction with opium, have occasionally been administered with success. Electricity and the vapour bath have also proved useful. In all cases the bowels should be moved by active aperients, either by the mouth or per anum.

TETTERS. The popular name of several cutaneous diseases, the treatment of which can only be properly undertaken by the experienced medical man.

THALLIUM. *Th.* [Eng., L.] A heavy metal, belonging to the mercury, silver, and lead group, discovered by Crookes in the early part of 1861, and displayed by him as "a new metallic element" at the opening of the International Exhibition, on the 1st of May, 1862. Thallium is a widely diffused metal, being found in many minerals, particularly iron- and copper-pyrites and native sulphur. It has recently been obtained in comparatively large quantities from the dust of the flues leading to sulphuric acid chambers. The spectrum of thallium consists of a single most characteristic line of a beautiful green colour. The spectrum produced when the metal is burnt in the electric arc is, however, more complicated, and consists of several green, blue, and other lines.

Thallium melts at 550° Fahr., and at a less heat may be readily welded, a property that has hitherto been regarded as peculiar to iron and platinum. Its specific gravity varies from 11·8 to 11·9, according to the mode of preparation. When freshly cut it has a dull white colour, destitute of the brilliancy of polished silver. Exposed to the air, it tarnishes rapidly, a straw-coloured oxide making its appearance on the surface. The oxide is alkaline and caustic to the taste, and much more soluble than the oxides of silver and lead. The metal is remarkable for its strongly marked diamagnetic characters, resembling bismuth in this respect. The alloys of thallium are very remarkable. Copper, alloyed with only one half per cent. of thallium, becomes quite brittle; but the alloy with tin is malleable. Mr. Crookes has prepared a great number of the salts of this interesting metal. These need not be described here, as they have not yet been applied to any use in the arts.

THEBAÏNE. $C_{19}H_{21}NO_3$. *Syn.* **THEBAÏA**, **PARAMORPHIA.** A crystalline substance obtained by Thibourméry from an infusion of opium that has had its morphia extracted by acting on it by an excess of lime.

THEÏNE. $C_8H_{10}N_4O_2$. *Syn.* **THEÏNA.** An alkaloid extracted from tea. It is identical with caffeine, and may be obtained from tea in the same manner as that substance is from coffee. The best gunpowder tea contains fully 6% of theine, about one half of which is lost in the present careless mode of making infusion of tea for the table.

THENARD'S BLUE. See **ULTRAMARINE** (Cobaltic).

THEOBROMÆ OLEUM. *Syn.* **CACAO BUTTER.** A concrete oil, obtained by expression and heat from the ground seeds of *Theobroma Cacao*. Occurs in cakes of a yellowish colour, of a pleasant cacao odour. Does not become rancid from exposure to air. Contained in all the suppositories.

Not official.—The following form good bases for suppositories:—Theobroma oil, when melted, begins to solidify at 72° Fahr.; stearine of cocoa-nut oil at 75° Fahr.; 4 of stearine and 2 of mutton fat at 77° Fahr.; 4 of stearine and 1 spermaceti at 80° Fahr. Stearine alone is, perhaps, a better substance than cacao butter for making suppositories. It begins to solidify at 78° Fahr., but there is stearine that solidifies at 120 Fahr.; this will not answer for suppositories.

THEOBROMINE. A peculiar principle, closely resembling caffeine of theine, found by Woskresensky in the seed of the *Theobroma Cacao*, or the nuts from which chocolate is prepared. Its form is that of a light, white, crystalline powder, which is rather less soluble than caffeine. It is obtained like caffeine. See **COCOA**.

THERIACA. A name given in ancient pharmacy to various compound medicines, chiefly electuaries or confections, employed as antidotes to poisons or infection. The **THERIACA ANDROMACHI**, Ph. L. 1746, contained above 60 ingredients. Mithridate and Venice treacle are examples of this class. See **TREACLE**.

THERMOMETERS. **FAHRENHEIT'S** scale is the one generally employed in England, while that of **CELSIUS**, or the **CENTIGRADE** scale, is principally used on the Continent. **REAUMUR'S** is another scale occasionally employed. **DE LISLE'S** thermometer was formerly used in Russia, and some other parts of the north of Europe. As references to these scales are frequently met with in books, it is useful to know their relative value, and the method of reducing the one to the other. The boiling-point of water is indicated by 212° on Fahrenheit's scale, 100° on the Centigrade scale, 80° on that of Reaumur, and 0° on that of De Lisle; the freezing-point of water marks 32° Fahrenheit, and 0°, or zero, on the Centigrade and Reaumur, and 150° on the scale of De Lisle. The 0° or zero of Fahrenheit is 32° below the freezing-point of water.

1. To reduce Centigrade degrees to those of Fahrenheit, multiply them by 9, divide the product by 5, and to the quotient add 32; that is—

$$\frac{\text{Cent.}^\circ \times 9}{5} + 32 = \text{Fahr.}^\circ$$

2. To reduce Fahrenheit's degrees to Centigrade:—

$$\frac{\text{Fahr.}^\circ - 32 \times 5}{9} = \text{Cent.}^\circ$$

3. To reduce Reaumur's to Fahrenheit's:—

$$\frac{\text{Reau.}^\circ \times 9}{4} + 32 = \text{Fahr.}^\circ$$

4. To convert Fahrenheit's to Reaumur's:—

$$\frac{\text{Fahr.}^\circ - 32 \times 4}{9} = \text{Reaumur.}^\circ$$

Thermometers intended to register extreme degrees of heat are called PYROMETERS (which see).

THORIUM. Th. *Syn.* THORINUM. A very rare element, belonging to the group of earthy metals. Metallic base of thorium. It is obtained by the action of potassium on the chloride of thorium, and washing the resulting mass in water.

THORN-APPLE. See DATURA.

THROAT AFFECTIONS. We intend here only to allude to those arising from exposure or cold. The list is, therefore, a short one. CROUP, one of the most important, has been already briefly noticed.

QUINSEY, or INFLAMMATORY SORE THROAT, commonly commences with stiffness and pain on one side of the throat, and swelling of the tonsils, attended by febrile symptoms, which increase as tumefaction advances, and sometimes become extreme. There is great restlessness and anxiety, considerable difficulty in swallowing even liquids, the respiration is painful and laborious, and the speech obstructed. When the inflammation is not resolved, these symptoms rapidly increase in severity, the patient suffers the greatest misery, the tumour suppurates rapidly, the abscess bursts, and with the rupture comes almost immediate relief. It occasionally happens that the other side of the throat then becomes affected, and goes through the same stages; but in general this is not the case, and the patient rapidly recovers, a few detergent gargles and a light nutritious diet being all that is required. Sometimes, at the very commencement of the attack, the inflammation may be resolved by the patient sucking a lozenge or powder, every hour or two, containing $\frac{1}{4}$ or $\frac{1}{2}$ gr. of tartarised antimony carefully triturated with about 20 grs. of lump sugar, so as to keep up a constant state of nausea or vomiting for hours.

MALIGNANT SORE THROAT is marked by the inflammation of the tonsils being more superficial; but no sooner does it occur than it passes into small ulcers of varied colours and appearance, extending to the pharynx, and spreading over the whole fauces, into the nostrils, and even around the glottis and down the œsophagus. These ulcers rapidly slough, and the febrile symptoms of a typhoid character, which are present throughout, become more or less severe. In this way the disease often hastens to a fatal termination, and, being highly contagious, often extends itself to all, or nearly all, the members of a family. The treatment must be similar to that

adopted for typhus fever. Stimulating gargles, containing capsicum, the mineral acids, or port wine, are useful local remedies.

THRUSH. *Syn.* APHTHA, L. A disease of infancy, which, in its common form, is marked by small white ulcers upon the tongue, palate, and gums. In some cases it extends through the whole course of the alimentary canal, and, assuming a malignant form, proves fatal. The treatment consists of a gentle emetic of ipecacuanha wine, followed by an occasional dose of rhubarb and magnesia, to keep the bowels clear, and to arrest diarrhoea. The ulceration may be touched with a little honey of borax; and if they assume a dark colour, or there be much debility, astringents and tonics should be had recourse to. In all cases the diet should be light, but supporting, as imperfect nutrition is a common cause of the disease.

TIC DOULOUREUX. [Fr.] According to a writer in one of the medical periodicals, a solution of atropia, 2 grs., in water, 1 fl. dr., to which nitric acid, 1 drop (minim), has been previously added, applied as a paint, by means of a camel-hair pencil, to the part of the face over the spot affected, immediately and completely subdues the pain, or, at all events, within 3 to 5 minutes, in all accidental cases, and affords considerable relief in others. The application is to be continued until some relief is experienced. The solution, being very poisonous, must not be taken internally, nor applied to the skin when broken. See ATROPIA and NEURALGIA.

TIN. Sn. *Syn.* STANNUM (Ph. E. & D.), L. This metal has been known from the most remote antiquity, being mentioned in the books of Moses (*Numb.* xxxi, 22), and by Homer (*Iliad*, x, 25), and other early writers. The ancients obtained it principally, if not solely, from Cornwall. The Phœnicians traded with England for this metal at least 1000 years before the birth of Christ.

Tin occurs in nature in the state of oxide and, more rarely, as sulphide (TIN PYRITES). In Cornwall it is found under the form of peroxide (MINE-TIN, TIN-STONE), associated with copper ore, in the slate and granite rocks, and as an alluvial deposit (STREAM TIN) in the beds of rivers.

Prep., &c. The ore is first reduced to powder in stamping-mills, washed to remove earthy matter, and then roasted to expel arsenic and sulphur; it is next deoxidised or reduced by smelting it with about 1-6th of its weight of powdered culm, and a little slaked lime; it is, lastly, refined by 'liquation,' followed by a second smelting of the purer portion, which, after being treated in a state of fusion, for some time with billets of green wood, or 'tossed,' as the workmen call it, is allowed to settle, and is then cast into large blocks, which, after being assayed, receive the stamp of the duchy. Two varieties of commercial tin are known, called respectively grain tin and

bar tin. The first is the best, and is prepared from the stream ore.

Prop. Tin approaches silver in whiteness and lustre; in hardness it is intermediate between gold and lead; it is very malleable when pure, but the presence of a very small quantity of any other metal, particularly lead, deprives it of this property; when rubbed it evolves a peculiar odour, and when bent backwards and forwards it emits a peculiar crackling noise; it melts at 442° Fahr.; volatilises at a white heat; and when heated above its melting-point, with free access of air, is speedily converted into a yellowish-white powder, which is the peroxide, or the 'putty powder' of polishers. Sp. gr. 7.29 to 7.31.

Pur. It is almost entirely dissolved by hydrochloric acid, yielding a colourless solution; the precipitate thrown down by hydrate of potassium is white, and soluble in excess of the precipitant. If it contain arsenic, brownish-black flocks will be separated during the solution, and arseniuretted hydrogen evolved, which may be inflamed and tested in the usual manner. The presence of other metals in tin may be detected by treating the hydrochloric solution with nitric acid, sp. gr. 1.16, first in the cold, and afterwards with heat, until all the tin is thrown down in the state of insoluble stannic oxide. The decanted acid solution from pure tin leaves no residuum on evaporation. If, after all the acid has been dissipated by heat, dilution with water occasion a heavy white precipitate, the sample contained bismuth; if, after dilution, a solution of sulphate of ammonium or of sodium produce a similar white precipitate (sulphate of lead), it contained lead; if ammonia, added in excess, occasion reddish-brown flocks, or ferricyanide of potassium give a blue precipitate, it contained iron; and, if the clear supernatant liquid leave a residuum on evaporation, copper.

Tests. The stannous salts are characterised as follows:—1. Hydrate of potassium gives a bulky white precipitate, readily soluble in excess of the precipitant; on concentrating the solution, the precipitate is changed from stannous hydrate into stannic hydrate, which remains in solution, and metallic tin, which separates in brown flakes.—2. Ammonia, and the carbonates of potassium, sodium, and ammonium, give white precipitates, insoluble in excess.—3. Sulphuretted hydrogen gives, in neutral and acid solutions, a dark brown precipitate, which is soluble in hydrate of potassium, in the alkaline sulphides (especially when they contain an excess of sulphur), and in strong hot hydrochloric acid; and insoluble in nitric acid, even when boiling.—4. Sulphide of ammonium produces a like brown precipitate, soluble in excess of the precipitant, provided the latter contains an excess of sulphur.—5. Trichloride of gold gives, in the cold, on the addition of a little nitric acid, a precipitate of the purple of Cassius.—6. Mercuric chloride

gives a black precipitate, but in excess it produces a white one.

Stannous Chloride. SnCl_2 . *Syn.* PROTOCHLORIDE OF TIN. *Prep.* (ANHYDROUS.) Distil a mixture of tin and mercuric chloride. Gray, resin like, solid, fusible, and volatile.

(HYDRATED; TIN SALT.) Boil an excess of tin in hydrochloric acid. A powerful deoxidising agent. It is somewhat extensively used as a mordant in dyeing.

Stannous Iodide. SnI_2 . *Syn.* PROTIODIDE OF TIN. Heat tin and iodine together. A fusible, brownish-red, translucent substance, soluble in water.

Stannous Hydrate. $\text{Sn}(\text{HO})_2$. *Syn.* HYDRATED OXIDE OF TIN. *Prep.* Precipitate stannous chloride with carbonate of potassium, well wash, and dry under 196° . Grayish-white powder, soluble in acids and alkaline hydrates, except ammonia.

Stannous Oxide. SnO . *Syn.* PROTOXIDE OF TIN. *Prep.* Ignite the hydrate in an atmosphere of carbonic anhydride. Black powder, inflammable in air, and insoluble in acids.

Stannous Sulphide. SnS . *Syn.* PROTOSULPHIDE OF TIN. A brittle bluish-gray substance, obtained by heating tin and sulphur.

The stannous salts behave with reagents as follows:—1. Hydrate of potassium, ammonia and alkaline carbonates, give a white precipitate, which is freely soluble in an excess of hydrate of potassium and in acids, sparingly soluble in excess of ammonia, only very slightly soluble in excess of carbonate of potassium, and insoluble in excess of carbonate of ammonium.—2. Sulphuretted hydrogen gives, in acid neutral solutions, a golden-yellow precipitate, either at once or on heating the liquid, which is readily soluble in pure hydrate of potassium, the alkaline sulphides, and boiling hydrochloric acid; less soluble in ammonia, and insoluble in nitric acid.—3. A plate of metallic zinc throws down metallic tin, under the form of gray scales or a spongy mass, from solutions free from nitric acid; and from those containing free nitric acid, white stannic hydrate.—4. Mercuric chloride gives a white precipitate.—5. Ferrocyanide of potassium gives no precipitate at first, but after a time the whole forms a thick jelly.

Assay. Each grain of stannic oxide (see above), after being washed and gently ignited, is equivalent to .78865 gr. of pure tin. The loss of weight represents the impurities. Each gr. of sulphate of lead, so treated, is equiv. to .683 gr. of metallic lead (nearly).

Uses. The uses of tin in the arts are well known. In medicine, 1 to 3 drs. of the filings or powder, made into an electuary with treacle, are sometimes given in tape-worm, for 2 or 3 successive mornings, followed by an aperient.

Stannic Chloride. SnCl_4 . *Syn.* BICHLORIDE OF TIN, TETRACHLORIDE OF TIN, PERCHLORIDE OF TIN, PERMUTATE OF T.; STANNI BICHLORIDUM, STANNI PERMURIAS,

L. Prep. 1. (Liebig.) By dissolving grain tin in a mixture of hydrochloric acid, 2 parts; nitric acid and water, of each, 1 part; (all by volume;) observing to add the tin by degrees, and to allow one portion to dissolve before adding another, as without this precaution the action is apt to become violent, and stannic oxide of tin to be deposited.

2. (ANHYDROUS; LIBAVIUS'S FUMING LIQUOR.) By heating stannous chloride in chlorine gas; or, by distilling a mixture of powdered tin, 1 part, with corrosive sublimate, 3 parts (5 parts—Fownes). A very volatile, colourless, mobile liquid, which fumes in the air, and boils at 248° Fahr.; when mixed with 1-3rd of its weight of water, it solidifies to a crystalline mass.

Obs. Solution of stannic chloride is much used by dyers, under the names of 'SPIRITS OF TIN,' 'DYER'S SPIRITS,' 'TIN MORDANT,' &c., the proportions of the ingredients and the state of dilution being various according to circumstances or the caprice of the manufacturer. A process which has been highly recommended, and which seems preferable to all others, is to prepare a simple solution of the stannous chloride, and to convert it into a solution of the stannic chloride, either by the addition of nitric acid and a gentle heat, or by passing chlorine through it. See TIN MORDANTS.

Stannic Iodide. SnI_4 . By dissolving stannic hydrate in hydriodic acid. Yellow, silky crystals.

Stannic Hydrate, $\text{Sn}(\text{HO})_4$. *Syn.* HYDRATED PEROXIDE OF TIN, STANNIC ACID. *Prep.* 1. By adding hydrate of potassium or an alkaline carbonate to a solution of stannic chloride. Soluble in acids and pure alkalies. Its compounds with the latter are sometimes called STANNATES.

Stannic Oxide. SnO_2 . *Syn.* BINOXIDE OF TIN, PEROXIDE OF TIN. *Prep.* By the action of nitric acid on metallic tin, the resulting white powder being well washed with water; or, by heating metallic tin above its melting-point, in the air. Yellow; anhydrous; insoluble.

Obs. Frémy has given the name of METASTANNIC ACID to the oxide prepared by the action of nitric acid on metallic tin; the hydrate he calls STANNIC ACID. See POLISH-ER'S PUTTY (page 997).

Stannic Sulphide. SnS_2 . *Syn.* BISULPHIDE OF TIN, BRONZE POWDER, MOSAIC GOLD; AURUM MUSIVUM, AURUM MOSAICUM, STANNI BISULPHURETUM, L. *Prep.* 1. To pure tin, 12 oz., melted by a gentle heat, add of mercury, 6 oz.; to the powdered mass, when cold, add of chloride of ammonium, 6 oz.; flowers of sulphur, 7 oz.; and after thorough admixture place the compound in a glass flask or matrass, and gradually heat it, imbedded in sand, to low redness, and continue the heat for several hours, or until white fumes cease to be disengaged; the 'aurum musivum' remains at the

bottom of the vessel, under the form of soft and very brilliant gold-coloured flakes.

2. (Berzelius.) Stannic oxide and sulphur, of each, 2 parts; chloride of ammonium, 1 part; mix, and expose it to a low red heat in a glass or earthenware retort, until sulphurous fumes cease to be evolved.

Used as a metallic gold colour, or substitute for powdered gold, in bronzes, varnish work, sealing-wax, &c.

TIN FILINGS. See TIN POWDER (below).

TIN GLASS. See BISMUTH.

TIN MORDANTS. *Syn.* DYER'S SPIRIT, SOLUTION OF TIN, SPIRIT OF T., NITROMURIATE OF T. These, as noticed above, vary greatly in their composition and character.

Prep. 1. Take of aquafortis, 8 parts; sal ammoniac or common salt, 1 part; dissolve, and add, very gradually, of grain tin, 1 part; and, when dissolved, preserve it in stoppered bottles from the air. This is the common 'SPIRIT OF TIN' of the dyers.

2. (Berthollet.) Nitric acid, at 30° Baumé, 8 parts; sal ammoniac, 1 part; dissolve, then add by degrees, of tin, 1 part; and, when dissolved, dilute the solution with 1-4th of its weight of water.

3. (Dambourney.) Hydrochloric acid, at 17° Baumé, 4 parts; nitric acid, at 30° Baumé, 1 part; mix, and add by degrees, of Molucca tin, 1 part.

4. (Hellot.) Nitric acid and water, of each, 1 lb.; sal ammoniac, 1 oz.; nitre, $\frac{1}{2}$ oz.; dissolve, then add, by degrees, of granulated tin, 2 oz.

5. (Poerner.) Nitric acid and water, of each, 1 lb.; sal ammoniac, $1\frac{1}{2}$ oz.; dissolve, then add, by very slow degrees, of pure tin beaten into ribands, 2 oz.

6. (Schoeffer.) Nitric acid and water, of each, 2 lbs.; sal ammoniac, 2 oz.; pure tin, $4\frac{1}{2}$ oz.; as last. All the above are used chiefly for dyeing scarlet, more particularly with cochineal.

7. (LAC SPIRIT.) From grain tin, 1 lb., slowly dissolved in hydrochloric acid (sp. gr. 1.19), 20 lbs. Recommended as a solvent for lac dye. For use, $\frac{1}{2}$ to 1 lb. of the liquid is digested on each lb. of the dye for 5 or 6 hours, before adding it to the dye bath.

8. Hydrochloric acid, $6\frac{1}{2}$ lbs.; aquafortis, $\frac{1}{2}$ lb.; grain tin, gradually added, 1 lb. Recommended for lac dye.

TIN-PLATE. Iron-plate covered with a coating of tin, by dipping it into a bath of that metal.

TIN POWDER. *Syn.* TIN FILINGS, TIN DUST; STANNI PULVIS (Ph. E. & D.), L. *Prep.* 1. (Ph. E.) Melt grain tin in an iron vessel, pour it into an earthenware mortar heated a little above its melting-point, and triturate briskly as the metal cools; lastly, sift the product, and repeat the process with what remains in the sieve.

2. (Ph. D.) Melt grain-tin in a black-lead crucible, and, whilst it is cooling, stir it with a rod of iron until it is reduced to powder

let the finer particles be separated by means of a sieve, and when, after having been several times in succession shaken with distilled water, the decanted liquor appears quite clear, let the product be dried for use.

Obs. Powdered tin is also prepared by filing and rasping.—*Dose.* 2 to 4 drs., as a vermifuge. *POLISHER'S PUTTY*, coloured with ivory black, is frequently substituted for this powder, and hence arises the ill effects that sometimes follow its use.

TINNING. *Proc.* 1. Plates or vessels of brass or copper, boiled with a solution of stannate of potassa, mixed with turnings of tin, become, in the course of a few minutes, covered with a firmly attached layer of pure tin.

2. A similar effect is produced by boiling the articles with tin filings and caustic alkali or cream of tartar.

Obs. By either of the above methods chemical vessels made of copper or brass may be easily and perfectly tinned.

TINCTURE. *Syn.* TINCTURA, L.; TEINTURE, Fr. Tinctures (TINCTURÆ; ALCOOLÉS, ALCOOLATURES) are solutions of the active principles of bodies, obtained by digesting them in alcohol more or less dilute. **ETHEREAL TINCTURES** (TINCTURÆ ÆTHERÆ; ÉTHÉROLÉS, ÉTHÉROLATURES) are similar solutions prepared with ether.

Prep. "Tinctures are usually prepared by reducing the solid ingredients to small fragments, coarse powder, or fine powder, macerating them for 7 days, or longer, in proof spirit or rectified spirit, straining the solution through linen or calico (or paper), and finally expressing the residuum strongly, to obtain what fluid is still retained in the mass. They are also advantageously prepared by the method of displacement or percolation." (Ph. E.) "All tinctures should be prepared in closed glass (or stoneware) vessels, and be shaken frequently during the process of maceration." (Ph. L.) Cooper's patent jars are very convenient for the preparation of tinctures, as they are made with wide mouths, large enough to admit the hand, and yet may be closed in an instant, with as much ease and certainty as an ordinary stoppered bottle.

Tinctures are better clarified by repose than by filtration, as in the latter case a considerable portion is retained by the filtering medium, and lost by evaporation. The waste in this way is never less than 10% of spirit. In all ordinary cases, it is sufficient to allow the tincture to settle for a few days, and then to pour off the clear supernatant portion through a funnel loosely choked with a piece of sponge or tow; after which the remaining foul portion of the liquid may be filtered through bibulous paper in a covered funnel. The filtration should be conducted as rapidly as possible, for the double purpose of lessening the amount lost by evaporation, and the action of the air on the fluid. Tinctures which have

been long exposed to the air frequently lose their transparency within a few days after being filtered, owing to the oxidisement and precipitation of some portion of the matter previously held in solution, a change which occurs even in stoppered bottles. Resinous and oily tinctures, as those of myrrh, tolu, and lavender (comp.), may be generally restored to their former brightness by the addition of a quantity of rectified spirit, equal to that which they have lost by evaporation; but many tinctures resist this mode of treatment, and require refiltering.

Ethereal tinctures are best prepared by percolation, and should be both made and kept in stoppered bottles.

Qual. The tinctures of the shops are usually very uncertain and inferior preparations, owing to their manufacture being carelessly conducted, and refuse drugs and an insufficient quantity of spirit being employed in their production. It is a general practice among the druggists to substitute a mixture of equal parts of rectified spirit and water, or a spirit of about 26 u. p., for proof spirit; and a mixture of 2 galls. of water with 5 galls. of rectified spirit, for rectified spirit. In some wholesale drug-houses all the simple tinctures (except those that are of a very active or valuable kind, as LAUDANUM, for instance) are made with 1 lb. of the dry ingredient to the gal. of spirit, irrespective of the instructions in the Pharmacopœia. Appearance is the object which is alone aimed at, without reference to quality. If the tincture be perfectly transparent, and has a good colour, the conscience of the seller and the stomach of the consumer are alike satisfied.

Assay. 1. The RICHNESS in ALCOHOL may be readily determined by Brande's method of alcoholometry; but more accurately by the method of M. Gay-Lussac (see ALCOHOLOMETRY). That of tinctures containing simple extractive, saccharine, or like organic matter, in solution, may be approximately found from the boiling-point, or from the temperature of the vapour of the boiling liquid.

2. The QUANTITY of SOLID MATTER per cent. may be ascertained by evaporating to dryness 100 grains-measure, in a weighed capsule, by the heat of boiling water.

3. The QUANTITY of the INGREDIENTS used in the preparation of tinctures may be inferred from the weight last found, reference being had to the known per-centage of extract which the substances employed yield to spirit of the strength under examination. When the ingredients contain alkaloids, or consist of saline or mineral matter, an assay may be made for them.

Uses, &c. Tinctures, from the quantity of alcohol which they contain, are necessarily administered in small doses, unless in cases where stimulants are indicated. The most important and useful of them are those that contain very active ingredients, such as the tincture of opium, foxglove, hemlock,

henbane, &c. In many instances the solvent, even in doses of a few fluid drachms, acts more powerfully on the living system than the principles it holds in solution; and, when continued for some time, produces the same deleterious effects as the habitual use of ardent spirits. When the action of a substance is the reverse of stimulant, it cannot with propriety be exhibited in this form, unless the dose be so small that the operation of the spirit cannot be taken into account, as with the narcotic tinctures. Hence, this class of remedies are in less frequent use than formerly.

The following list embraces all the formulæ of the tincturæ of the London, Edinburgh, Dublin, and British Pharmacopœias, with a few others likely to be useful to the reader. These will furnish examples for the preparation of others in less general use, care being had to proportionate the ingredients with due reference to the proper or usual dose of tinctures of that class.

Tincture of Acetate of Iron. *Syn.* TINCTURA FERRI ACETATIS (B. P., Ph. D.), L. *Prep.* 1. (B. P.) Solution of persulphate of iron, 5; acetate of potash, 4; rectified spirit, q. s.; dissolve the acetate of potash in 20 of water and add 16 of spirit to the solution of iron; mix the two liquids, and shake well occasionally for an hour, then filter, and add to the filtered liquid sufficient rectified spirit to make up 40.—*Dose.* 5 to 30 minims.

2. (Ph. D.) To water, 9 fl. oz., add of pure sulphuric acid, 6 fl. drs.; and in the mixture, with the aid of a gentle heat, dissolve sulphate of iron, 8 oz.; next add of pure nitric acid, $\frac{1}{2}$ fl. oz., previously diluted with water, 1 fl. oz., and evaporate the resulting solution to the consistence of a thick syrup; dissolve this in rectified spirit, 1 quart; also dissolve of acetate of potassa, 8 oz., in another quart of rectified spirit; and having thoroughly mixed the solutions, by frequent agitation in a large bottle, filter the whole, with expression, first through calico, and then through paper. Sp. gr. 891.—*Dose.* 15 to 60 drops, in water, in the same cases as in the other chalybeates.

Tincture of Acetate of Zinc. *Syn.* TINCTURA ZINCI ACETATIS, L. *Prep.* (Ph. D. 1826.) Acetate of potassa and sulphate of zinc, of each, 1 oz.; rub them together, then add of rectified spirit, 16 fl. oz.; macerate for a week, and filter., Astringent. Diluted with water, it is used as a collyrium and injection.

Tincture of Aconite. *Syn.* TINCTURA ACONITI (Ph. L.), TINCT. ACONITI RADICIS (B. P., Ph. D.), L. *Prep.* 1. (B. P.) Powdered root, 1; rectified spirit to percolate, 8; macerate for 48 hours with three fourths of the spirit, agitating occasionally, pack in a percolator and let it drain, then pour on the remaining spirit; when it ceases to drop, press the marc and add spirit to make up 8.—*Dose.* 5 to 15 minims, twice or thrice a day.

2. (Ph. L.) Take of aconite root, coarsely powdered, 15 oz. (20 oz.—Ph. D.); rectified

spirit, 1 quart; macerate for 7 days, press, and filter.

Obs. These tinctures differ materially in strength.—*Dose.* Of the Ph. L., 5 to 10 drops; of the Ph. D., 3 to 6 drops, two or three times daily (carefully watching its effects); in rheumatism, gout, syphilis, &c., where a narcotic sedative is indicated. Diluted with water, it forms an excellent embrocation in rheumatism, neuralgia, &c. It should be applied by means of a small sponge, tied to the end of a stick or glass rod. The Ph. D. formula is nearly the same as that for Dr. Turnbull's concentrated tincture of aconite root, and that given by Dr. Pereira. The TINCTURA ACONITI FOLIORUM of the Ph. U. S. is made with 1 oz. of the dried leaves to 8 fl. oz. of rectified spirit.

Tincture of Aloes. *Syn.* TINCTURA ALOËS (B. P., Ph. L. & E.), L. *Prep.* 1. (B. P.) Socotrine aloes, 1; extract of liquorice, 3; proof spirit, 40; macerate seven days, press, and wash the marc with spirit to make 40.—*Dose.* 1 to 2 drs.

2. (Ph. L.) Socotrine or hepatic aloes, coarsely powdered, 1 oz.; extract of liquorice, 3 oz.; water, $\frac{1}{2}$ pint; rectified spirit, $\frac{1}{2}$ pint; macerate for 7 days, and filter. The formula of the Ph. E. is nearly similar. Purgative and stomachic.—*Dose.* $\frac{1}{2}$ to 1 fl. oz.

Tincture of Aloes (Compound). *Syn.* TINCTURE OF ALOES AND MYRRH; TINCTURA ALOËS COMPOSITA (Ph. L.), TINCTURA ALOËS ET MYRRHÆ (Ph. E.), ELIXIR ALOËS†, L. *Prep.* 1. (Ph. L. & E.) Socotrine or hepatic aloes, coarsely powdered, 4 oz.; hay saffron, 2 oz.; tincture of myrrh, 1 quart; macerate for 7 days, with occasional agitation, and strain. The Dublin College (1826) omits the saffron.

2. (Wholesale.) From aloes, 1 lb.; myrrh, $\frac{1}{2}$ lb.; hay saffron, 2 oz.; rectified spirit, 5 pints; water, 3 pints; as the last. Purgative, stomachic, and emmenagogue.—*Dose* $\frac{1}{2}$ to 2 fl. drs.

Tincture of Ammo'nia (Compound). *Syn.* TINCTURA AMMONIÆ COMPOSITA (Ph. L.), L. *Prep.* 1. (Ph. L.) Mastix, 2 drs.; rectified spirit, 9 fl. drs.; digest until dissolved, decant, add, of oil of lavender, 14 drops; stronger solution of ammonia, 1 pint; and mix well.

2. (Ph. L. 1836; AQUA LUCIÆ; EAU DE LUCÆ.) As the last, but adding 4 drops of oil of amber along with the oil of lavender.

Obs. This preparation is reputed antacid, antispasmodic, and stimulant.—*Dose.* 10 to 20 drops, in water; in hysteria, low spirits, &c. In the East Indies, eau de luce is regarded almost as a specific for the bite of the cobra di capello and other venomous reptiles.

Tincture of Ammo'nia-chlo'ride of Iron. *Syn.* AMMONIATED TINCTURE OF IRON, MYNSIGHT'S A. T. OF I., TINCTURA FERRI AMMONIO-CHLORIDI (Ph. L.), TINCTURA FERRI AMMONIATI, L. *Prep.* (Ph. L.) Ammonio-chloride of iron, 4 oz.; proof spirit and distilled

water, of each, 1 pint; dissolve.—*Dose.* 20 to 60 drops, or more; as a stimulant, chalybeate tonic. "A fl. oz. of this, on potassa being added, yields 5·8 grs. of sesquioxide of iron." (Ph. L.)

Tincture of Angustura. Tincture of cusparia.

Tincture of Arnica. *Syn.* TINCTURA ARNICÆ, T. A. FLOREM, L. *Prep.* (Ph. Bor. and Hamb. Cod.) Flowers of *Arnica montana*, 1½ oz.; spirit, sp. gr. .900 (15½ o. p.), 1 lb.; digest for 8 days, and strain, with expression.—*Dose.* 10 to 30 drops; in diarrhœa, dysentery, gout, rheumatism, paralysis, &c.

Tincture of Arnica Root. *Syn.* TINCTURA ARNICÆ (B. P.), TINCTURA ARNICÆ RADICIS, L. *Prep.* 1. (B. P.) Bruised root, 1; rectified spirit to percolate 20; macerate forty-eight hours with 15 of the spirit, agitating occasionally; pack in a percolator, and, when it ceases to drop, pour on the remaining spirit, let it drain, wash the marc, press, filter, and make up to 20.—*Dose.* 1 to 2 drs.

2. From arnica root, 2 oz.; proof spirit, 1 pint; as the last.

Tincture, Aromatic. Compound tincture of cinnamon.

Tincture of Assafoetida. *Syn.* TINCTURA ASSAFOETIDÆ (Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Assafoetida (small fragments), 1; rectified spirit, 8; macerate seven days, strain, filter, and add spirit to make 8.—*Dose.* ½ dr. to 1 dr.

2. (Ph. L.) Assafoetida (small), 5 oz.; rectified spirit, 1 quart; macerate for 7 days (14 days—Ph. D.), and filter. "It cannot be made by percolation with delay." (Ph. E.)

3. (Wholesale.) Assafoetida, 2½ lbs.; boiling water, 2 quarts; dissolve, add of rectified spirit, 1½ gal.; agitate well for 3 or 4 days, then let it settle, and decant the clear portion.—*Dose.* ½ to 2 fl. drs.; in hysteria, flatulent colic, &c.

Tincture of Assafoetida (Ammoniated). See FETID SPIRIT OF AMMONIA.

Tincture, Asthmatic. Compound tincture of camphor.

Tincture of Balsam of Peru. *Syn.* TINCTURA BALSAMI PERUVIANI, L. *Prep.* (Ph. L. 1788.) Balsam of Peru, 4 oz.; rectified spirit, 16 fl. oz.; dissolve. Pectoral, stimulant, and fragrant.—*Dose.* 10 to 30 drops.

Tincture of Balsam of Tolu. Tincture of Tolu.

Tincture of Bark. Tincture of cinchona.

Tincture of Belladonna. *Syn.* TINCTURA BELLADONNÆ (B. P., Ph. L. & D.), L. *Prep.* 1. (B. P.) The dried leaves in coarse powder, 1; proof spirit, 20; macerate forty-eight hours in 15 of the spirit, agitating occasionally; pack in a percolator, and when it ceases to drop, add the remaining spirit, let it drain, wash and press the marc; filter and make up 20.—*Dose.* From 5 to 20 minims.

2. (Ph. L.) Dried leaves of belladonna, 4 oz. (5 oz., in coarse powder—Ph. D.); proof spirit,

1 quart; macerate for 7 days (14—Ph. D.), press, and filter.

3. (Wholesale.) From the dried leaves, 1 lb.; proof spirit, 1 gal.; macerate 14 days.—*Dose.* 5 to 10 drops, gradually increased; also, externally, diluted with water.

Tincture of Benzoïn (Compound). *Syn.* FRIAR'S BALSAM, TRAUMATIC B., BALSAM FOR CUTS, COMMANDER'S BALSAM, VERVAIN'S B., WOUND B., JESUIT'S DROPS, WADE'S D.; TINCTURA BENZOINI COMPOSITA (B. P., Ph. L. & E.), TINCT. BENZOËS COMP., BALSAMUM TRAUMATICUM, L. *Prep.* 1. (B. P.) Benzoin, 8; prepared storax, 6; balsam of Tolu, 2; socotrine aloes, 1½; rectified spirit, 80; macerate seven days, filter, and wash the marc with spirit to make up 80.—*Dose.* ½ to 1 dr., triturated with mucilage or yolk of egg.

2. (Ph. L.) Gum benzoin, coarsely powdered, 3½ oz.; prepared storax, 2½; balsam of Tolu, 10 drs.; Socotrine or hepatic aloes, in coarse powder, 5 drs.; rectified spirit, 1 quart; macerate, with frequent agitation, for 7 days, and strain.

3. (Ph. E.) Benzoin, 4 oz.; balsam of Peru, 2½ oz.; East Indian (hepatic) aloes, ½ oz.; rectified spirit, 1 quart.

Obs. Either of the above formulæ produces a most beautiful tincture, truly balsamic. The following is, however, very generally employed by the wholesale druggists, and the product, though possessing a very rich colour, is thin and watery.

4. (Wholesale.) From gum benzoin, 4 lbs.; aloes (lively coloured), 1½ lb.; liquid storax, 1 lb.; balsam of Tolu, ½ lb.; powdered turmeric (best), 6 oz.; rectified spirit, 5½ galls.; digest with frequent agitation for 10 days, then add of hot water, 1½ gal., again digest for 4 days, and, after 24 hours' repose, decant the clear portion.

Dose. 10 drops to 2 fl. drs.; as a stimulating expectorant, in chronic coughs, and various breath affections. It is also employed to stop the bleeding from cuts, &c., and promote their healing.

Tincture, Bitter Stomachic. Tincture of gentian.

Tincture, Brandish's. Alkaline tincture of rhubarb.

Tincture of Buchu. *Syn.* TINCTURA DIOSMÆ, T. BUCKU (Ph. E.), T. BUCHU (B. P., Ph. D.), L. *Prep.* 1. (B. P.) Buchu bruised, 1; proof spirit, 8; macerate for forty-eight hours with ¾ of the spirit, pack in a percolator, and let it drain, then pour on the rest of the spirit; when it ceases to drop, press and wash the marc, filter and make up to 8.—*Dose.* 1 to 2 drs.

2. (Ph. E.) Buchu leaves, 5 oz.; proof spirit, 1 quart; macerate 7 days (14 days—Ph. D.); or proceed by the method of percolation.—*Dose.* 1 to 4 fl. drs.; as a tonic, sudorific, and diuretic. It is inferior to the fresh infusion.

Tincture of Calum'ba. *Syn.* TINCTURA CA-

LUMBÆ (B. P., Ph. L. & E.), T. COLOMBÆ (Ph. D.), L. *Prep.* 1. (B. P.) Bruised calumba, 1; proof spirit, 8; macerate forty-eight hours with 6 of the spirit, agitating occasionally; pack in a percolator, and let it drain, then pour on the remaining spirit; when it ceases to drop, press, and wash the marc with spirit to make up 8.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. L.) Calumba root, finely sliced, 3 oz.; proof spirit, 1 quart; macerate a week (14 days—Ph. D.), press, and filter. "Or, more conveniently, by percolation, allowing the calumba, in moderately fine powder, to first soak in a little of the spirit for 6 hours." (Ph. E.)

Obs. This tincture is commonly made with 1 lb. of calumba root to the gallon of a mixture of equal parts of rectified spirit and water.—*Dose.* 1 to 2 fl. drs.; as a stomachic bitter and tonic, usually joined with soda or chalybeates.

Tincture of Camphor. *Syn.* SPIRIT OF WINE AND CAMPHOR, CAMPHORATED SPIRIT; TINCTURA CAMPHORÆ (Ph. E. & D.), SPIRITUS CAMPHORÆ (Ph. L.), SPIRITUS CAMPHORATUS, L. *Prep.* 1. (Ph. E.) Camphor, 2½ oz.; rectified spirit, 1 quart; dissolve. This is only one half as strong as the Ph. L. preparation.

2. (Ph. D.) Camphor, 1 oz.; rectified spirit, 8 fl. oz. Stimulant and anodyne.—*Dose.* 10 to 60 drops. Also as a liniment for sprains, bruises, chronic rheumatism, &c. For the Ph. L. formula see SPIRIT.

Tincture of Camphor (Compound). *Syn.* CAMPHORATED TINCTURE OF OPIUM, ASTHMATIC ELIXIR, PARAGORIC E., ASTHMATIC TINCTURE; TINCTURA CAMPHORÆ COMPOSITA (B. P., Ph. L.), TINCTURA OPII CAMPHORATA (Ph. E. & D.), ELIXIR PAREGORICUM, L. *Prep.* 1. (B. P.) Opium, in coarse powder, 40 grs.; benzoic acid, 40 grs.; camphor, 30 grs.; oil of anise, $\frac{1}{2}$ dr.; proof spirit, 20 oz.; macerate seven days, strain, wash the marc with spirit, and filter 20 oz.—*Dose.* 15 to 60 minims.

2. (Ph. L.) Camphor, 50 grs.; powdered opium, and benzoic acid, of each, 72 grs.; oil of aniseed, 1 fl. dr.; proof spirit, 1 quart; macerate for 7 days, and filter. The formulæ of the Ph. E. & D. are nearly similar. The oil of aniseed, probably one of the most useful and characteristic of the ingredients, was omitted in the Ph. L. 1824, but was restored in that of 1836.

3. (Wholesale.) From powdered opium, 3 oz.; benzoic acid, camphor, and oil of aniseed, of each, 2 oz.; rectified spirit and water, of each, 3 galls.; as before.

Obs. This tincture is a popular and excellent pectoral and anodyne, where there are no inflammatory symptoms.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.; in troublesome coughs, &c. $\frac{1}{2}$ fl. oz. contains about 1 gr. of opium.

Tincture of Cantharides. *Syn.* TINCTURA CANTHARIDIS (B. P., Ph. L. E. & D.), TINCTURA LYTTÆ, L. *Prep.* 1. (B. P.) Can-

tharides, in coarse powder, 1; proof spirit, 80; macerate, agitating occasionally, for seven days, in a closed vessel, strain, press, filter, and add sufficient proof spirit to make up 80.—*Dose.* 5 to 20 minims.

2. (Ph. L.) Powdered cantharides, 4 drs. ($\frac{1}{2}$ oz.—Ph. D.), and strain, with expression.

3. (Wholesale.) From powdered cantharides, 2½ oz.; rectified spirit and water, of each, $\frac{1}{2}$ gall.; as the last.—*Dose.* 10 drops, gradually raised to 1 fl. dr., in any bland liquid; in fluor albus, gleet, incontinence of urine, lepra, &c. It should be used with caution. The Ed. College recommends it to be prepared by displacement.

Tincture of Capsicum. *Syn.* TINCTURE OF CAYENNE PEPPER, TINCTURA CAPSICI (B. P., Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Capsicum, bruised, 1; rectified spirit, 27; macerate 48 hours with three fourths of the spirit, agitating occasionally, pack in a percolator, and let it drain, then pour on the remaining spirit; as soon as it ceases to drop, wash the marc with spirit to make up 27.—*Dose.* 10 to 20 minims.

2. (Ph. L.) Capsicum, bruised, 10 drs.; proof spirit, 1 quart; digest 14 days (or percolate—Ph. E.).—*Dose.* 10 to 60 drops; in atonic dyspepsia, scarlet fever, ulcerated sore throat, &c. It is also made into a gargle.

3. (Ph. D.) Cayenne pods, bruised, 1½ oz.; proof spirit, 1 pint; macerate for 14 days. This is of fully twice the strength of the preceding.

Tincture of Capsicum (Concentrated). See ESSENCES.

Tincture of Cardamoms. *Syn.* TINCTURA CARDAMOMI (Ph. E.), TINCT. AMOMI REPERTIS, L. *Prep.* (Ph. L. 1836.) Cardamom seeds, 3½ oz. ($4\frac{1}{2}$ oz.—Ph. E.); proof spirit, 1 quart; digest for 14 days (or percolate—Ph. E.).

Obs. The shells should be sifted from the seeds before maceration, and the latter are preferably ground in a pepper-mill instead of being bruised in a mortar. Aromatic and carminative.—*Dose.* 1 to 2 fl. drs., as an adjunct to purgative mixtures.

Tincture of Cardamoms (Compound). *Syn.* STOMACHIC TINCTURE; TINCTURA CARDAMOMI COMPOSITA (B. P., Ph. L. E. & D.), TINCTURA STOMACHICA, L. *Prep.* 1. (B. P.) Cardamom seeds, freed from their pericarps, bruised, 1; caraway, bruised, 1; raisins, freed from their seeds, 8; bruised cinnamon, 2; cochineal, in powder, $\frac{1}{2}$; proof spirit, 80; macerate 48 hours with $\frac{1}{2}$ of the spirit, agitating occasionally, pack in a percolator, and let it drain, pour upon it the remainder of the spirit, and, when it ceases to drop, press, wash the marc with spirit to make up 80.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. L.) Cardamoms (without the shells), caraways, and cochineal, of each, bruised, 2½ drs.; cinnamon, bruised, 5 drs.; raisins, stoned, 5 oz.; proof spirit, 1 quart; macerate 7 days, then strain, with expression.

3. (Ph. E., and Ph. L. 1836.) As the last, but using only 1 dr. of cochineal, and macerating 14 days; or, "it may be prepared by the method of displacement." (Ph. E.)

4. (Wholesale.) From cardamoms and caraway seeds, of each, 4 oz.; cochineal (s. g.), 6 oz.; cassia, 8 oz.; sultana raisins, 5 lbs.; proof spirit, 4 galls. (or rectified spirit and water, of each, 2 galls.); macerate, &c., as before.

Obs. The Dublin College omitted the cochineal and raisins in their Ph. of 1826, but have restored them in their new one. The order of the London College to stone the raisins is seldom adopted in practice; by which the tincture is rendered unfit to be employed in dispensing prescriptions containing quinine or other alkaloids. When pharmacists are too lazy to follow the instructions in their Pharmacopœia, they had better use sultana raisins, which have no stones.—*Dose.* 1 to 4 fl. drs.; as a cordial and stomachic, but chiefly as an adjunct, for its colour and flavour.

Tincture of Cascarilla. *Syn.* TINCTURA CASCARILLÆ (B. P., Ph. L. E. & D.), *L. Prep.* 1. (B. P.) Cascarilla, bruised, 1; proof spirit, 8; macerate 48 hours with 6 of the spirit, agitating occasionally; pack in a percolator, let it drain, and pour on the remainder of the spirit, and, when it ceases to drop, wash the marc, press, filter, and make up 8.—*Dose.* $\frac{1}{2}$ to 2 drms.

2. (Ph. L.) Cascarilla, bruised, 5 oz.; proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.; or percolate—Ph. E.). An excellent tonic and stomachic; chiefly employed as an adjunct to mixtures, &c.—*Dose.* 1 to 2 fl. drs.

Tincture of Cassia. *Syn.* TINCTURE CASIÆ (Ph. E.), *L. Prep.* (Ph. E.) Cassia, $3\frac{1}{2}$ oz.; proof spirit, 1 quart; macerate for 7 days, or percolate. Stomachic and carminative.—*Dose.* 1 to 2 fl. drs.

Tincture of Castor. *Syn.* TINCTURA CASTOREI (B. P., Ph. L. & E.), TINCT. CASTOREI ROSSII, *L. Prep.* 1. (B. P.) Castor, in coarse powder, 1; rectified spirit, 20; macerate seven days, strain, and wash the marc with spirit sufficient to make up to 20.—*Dose.* $\frac{1}{2}$ to 1 dr.

2. (Ph. L.) Castor, bruised, $2\frac{1}{2}$ oz.; rectified spirit, 1 quart; macerate for 7 days (or percolate—Ph. E.).

Obs. The Dublin College ordered Russian castor in their Ph. of 1826; but the scarcity and high price of that variety, we fear, too often precludes its use. The tincture of the shops is usually made with only 8 oz. of castor to the gal. of proof spirit. Nervine and antispasmodic.—*Dose.* 20 drops to 2 fl. drs.; in hysteria, epilepsy, &c.

Tincture of Castor (Ammoniated). *Syn.* ELIXIR FETIDUM, TINCTURA CASTOREI COMPOSITA, T. C. AMMONIATA (Ph. E.), *L. Prep.* (Ph. E.) Castor, bruised, $2\frac{1}{2}$ oz.; assafœtida, in small fragments, 10 drs.; spirit of ammonia, 1 quart; digest 7 days in a well-closed vessel.

Stimulant and antispasmodic.—*Dose and uses,* as the last. With the addition of $\frac{1}{2}$ oz. of opium, it forms the Elixir Uterinum, or Elixir Castorei Thebaicum of foreign Pharmacopœias.

Tincture of Catechu. *Syn.* COMPOUND TINCTURE OF CATECHU; TINCTURA CATECHU COMPOSITA (Ph. L.), T. CATECHU (B. P., Ph. E. & D.), *L. Prep.* 1. (B. P.) Pale catechu, in coarse powder, $2\frac{1}{2}$; cinnamon, bruised, 1; proof spirit, 20; macerate for seven days with agitation, strain, press, and filter, and add spirit to make up 20.—*Dose.* $\frac{1}{2}$ to 2 drms.

2. (Ph. L.) Catechu, in powder, $3\frac{1}{2}$ oz. (4 oz.—Ph. D.); cinnamon, bruised, $2\frac{1}{2}$ oz. (2 oz.—Ph. D.); proof spirit, 1 quart; macerate for 7 days (or percolate—Ph. E.).

3. (Wholesale.) From catechu, 2 lbs.; oil of cassia, 3 fl. drs.; rectified spirit and water, of each, 1 gal.; macerate for 10 days.—*Dose.* 1 to 2 fl. drs., as a warm astringent; in diarrhoea, &c., either alone, or combined with chalk.

Tincture of Chiretta. *Syn.* TINCTURA CHIRAYTÆ (B. P.), TINCTURA CHIRAYTÆ, T. CHIRETTÆ (Ph. D.), *L. Prep.* (B. P.) Chiretta, cut small and bruised, 1; proof spirit, 8; macerate 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator and let it drain, then pour on the remaining spirit; when it ceases to drop, press, and wash the marc with spirit to make up 8.—*Dose.* 15 to 60 minims; B. Ph. dose $\frac{1}{2}$ to 2 drs.

2. (Ph. D.) Chiretta or chirayta (bruised), 5 oz.; proof spirit, 1 quart; macerate for 14 days. Tonic and stomachic.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.

Tincture of Cinchona. *Syn.* TINCTURE OF BARK; TINCTURA CINCHONÆ (B. P., Ph. L. E. & D.), T. CORTICIS PERUVIANI, T. c. P. SIMPLEX, *L. Prep.* 1. (B. P.) Yellow cinchona bark, in coarse powder, 4; proof spirit, 20; macerate 48 hours with 15 of the spirit, agitating occasionally, pack in a percolator and let it drain, then pour on the remaining spirit, and when it ceases to drop, press, and wash the marc with spirit to make 20.—*Dose.* 1 to 2 drms.

2. (Ph. L.) Yellow cinchona bark (bruised), 8 oz.; proof spirit, 1 quart; macerate for 14 days (or percolate—Ph. E.).

Obs. The Dublin College orders pale bark, and the Edinburgh either species, according to prescription.—*Dose.* 1 to 3 fl. drs.; as a tonic, stomachic, and febrifuge.

Tincture of Cinchona (Pale). *Syn.* TINCTURE OF PALE BARK; TINCTURA CINCHONÆ PALLIDÆ (Ph. L.), *L. Prep.* From pale bark, as the last.

Tincture of Cinchona (Compound). *Syn.* COMPOUND TINCTURE OF BARK, HUXHAM'S T. OF B., FEVER TINCTURE; TINCTURA CINCHONÆ COMPOSITA (B. P.), TINCTURA CINCHONÆ COMPOSITÆ (Ph. L. E. & D.), TINCT. CORTICIS PERUVIANI COMPOSITA, *L. Prep.* 1. (B. P.) Pale cinchona bark, in coarse powders; bitter orange peel, cut small and bruised, 2; serpentary, bruised, 1; Saffron, $\frac{1}{2}$;

cochineal, $\frac{1}{2}$; proof spirit, 40: macerate 48 hours with 30 of spirit, agitating occasionally, pack in a percolator and let it drain, then pour on the remainder of the spirit; when it ceases to drop, press, and wash the marc with spirit to make up 40.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. L.) Pale bark, bruised, 4 oz.; dried bitter orange-peel, 3 oz. (2 oz.—Ph. D.); serpentine root, bruised, 6 drs.; hay saffron, 2 drs.; cochineal, in powder, 1 dr.; macerate for 7 days (14 days—Ph. D.; or percolate—Ph. E.); press, and filter.

3. (Wholesale.) From pale bark, $3\frac{1}{2}$ lbs.; dried orange peel, 2 lbs.; serpentine root, 4 oz.; hay saffron, 1 oz.; cochineal, $\frac{1}{2}$ oz.; proof spirit, 4 galls, (or rectified spirit and water, of each, 2 galls.); macerate for 14 days.

Obs. In the Ph. E. yellow bark is ordered. *Dose and use*, as the last.

Tincture of Cinna'mon. *Syn.* TINCTURA CINNAMOMI (B. P., Ph. L. & E.), L. *Prep.* 1. (B. P.) Cinnamon, in coarse powder, 1; proof spirit, 8; macerate 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator and let it drain, then pour on the remaining spirit; when it ceases to drop, press, and wash the marc with spirit to make up 8.

2. (Ph. L.) Cinnamon, bruised, $3\frac{1}{2}$ oz.; proof spirit, 1 quart; macerate for 7 days (or percolate—Ph. E.). In the shops cassia is usually substituted for cinnamon, and spirit 26 u. p. for proof spirit.—*Dose.* 1 to 4 fl. drs.; as a cordial, aromatic, and stomachic.

Tincture of Cinnamon (Compound). *Syn.* AROMATIC TINCTURE; TINCTURA CINNAMOMI COMPOSITA (Ph. L. E. & D.), T. AROMATICA, L. *Prep.* 1. (Ph. L.) Cinnamon, bruised, 1 oz.; cardamoms (bruised, without the shells), $\frac{1}{2}$ oz.; long pepper and ginger, of each, $2\frac{1}{2}$ drs.; proof spirit, 1 quart; digest for 7 days (or percolate—Ph. E.). The Ph. E. omits the ginger, and uses $\frac{1}{2}$ oz. more cardamoms.

2. (Ph. D.) Cinnamon, 2 oz.; cardamoms, 1 oz.; ginger, $\frac{1}{2}$ oz.; proof spirit, 1 quart; macerate for 14 days. The following form is current in the wholesale houses.

3. Cassia, 1 lb.; cardamoms, 6 oz.; long pepper and ginger, of each, $\frac{1}{2}$ lb.; oil of cassia, $1\frac{1}{2}$ fl. drs.; proof spirit, 4 galls. (or rectified spirit and water, of each, 2 galls.). Cordial, aromatic, stomachic.—*Dose.* 1 to 2 fl. drs.; in atonic gout, debility, flatulence, &c.

Tincture of Cochineal. *Syn.* TINCTURA COCCI CACTI (Ph. D.), L. *Prep.* 1. (B. P.) Cochineal, in powder, 1; proof spirit, 8; macerate 7 days; strain, and wash the marc with spirit to make up 8.—*Dose.* 30 to 90 minims twice a day. (*Used chiefly for colouring medicines.*)

2. (Ph. D.) Cochineal, in fine powder, 2 oz.; proof spirit, 1 pint. Antispasmodic and sedative; but chiefly employed for its colour.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.

Tincture of Colchicum. *Syn.* GOUT TINCTURE, TINCTURE OF MEADOW SAFFRON; TINC-

TURA COLCHICI SEMINUM (B. P.); TINCTURA COLCHICI (Ph. L. & E.), T. SEMINUM COLCHICI (Ph. D.), L. *Prep.* 1. Colchicum seed, bruised, 1; proof spirit, 8: macerate 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator, and let it drain, then pour on the remainder of the spirit; when it ceases to drop, wash the marc with spirit to make up 8.—*Dose.* 15 to 30 minims.

2. (Ph. L.) Seeds of meadow saffron (*Colchicum autumnale*), bruised (finely ground in a coffee-mill—Ph. E.), 5 oz.; proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.; or percolate—Ph. E.); then press, and filter.—*Dose.* 15 to 20 drops to 1 fl. dr.; in gout, &c.

Tincture of Colchicum (Compound). *Syn.* TINCTURA COLCHICI COMPOSITA (Ph. L.), SPIRITUS COLCHICI AMMONIATUS, L. *Prep.* (Ph. L.) Colchicum seeds, bruised, 5 oz.; aromatic spirit of ammonia, 1 quart; digest for 7 days, then press, and filter.—*Dose.* 20 drops to 1 fl. dr.; in gout, &c.

Tincture of Colchicum Flowers. *Syn.* TINCTURA FLORUM COLCHICI; EAU MEDICINALE D'HUSSON (Dr. Wilson). *Prep.* Take of the fresh juice of colchicum flowers, 2 parts; French brandy (or proof spirit), 1 part; mix, and in a few days decant, or filter, and preserve it in small bottles in a cool place.

Tincture of Copaiba (Alkaline). *Syn.* TINCTURA COPAIBÆ ALKALINE, L. *Prep.* (Lewis Thompson.) Dissolve carbonate of potassa, 2 oz., in water, 1 pint, and add to this balsam of copaiba, in a thin stream, constantly stirring, until the mixture, at first white and milky, becomes clear, like jelly or amber, which will generally take place when about a pint of balsam has been added; set the mixture aside for two or three hours, then pour in of rectified spirit, 1 quart, and mix the whole together. Sweet spirit of nitre may be substituted for spirit of wine, provided it does not contain free acid.—*Dose.* 1 to 2 teaspoonfuls.

Tincture of Cubebs. *Syn.* ESSENCE OF CUBEBS; TINCTURA CUBEBÆ (B. P., Ph. L. & D.), TINCTURA PIPERIS CUBEBÆ, L. *Prep.* 1. (B. P.) Cubebs, in powder, 1; rectified spirit, 8: macerate 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator and let it drain; pour on the remaining spirit, and when it ceases to drop, wash the marc with spirit to make up 8.—*Dose.* 1 to 2 drs.

2. (Ph. L.) Cubebs (bruised or ground in a pepper-mill), 1 lb.; proof spirit, 1 quart; macerate for 7 days, press out the liquor, and filter.—*Dose.* $\frac{1}{2}$ to 1 fl. dr., three or four times a day, in gonorrhœa, &c.

3. (Ph. D., & Ph. L. 1836.) Cubebs, 5 oz.; rectified spirit, 1 quart (proof spirit—Ph. D. 1826); macerate for 14 days.—*Dose.* 1 to 2 fl. drs.

Tincture of Cusparia. *Syn.* TINCTURA CUSPARIÆ (Ph. E.), T. ANGOSTURÆ, L. *Prep.* (Ph. E.) Angostura bark or cusparia, $4\frac{1}{2}$ oz.; proof spirit, 1 quart; digest or percolate

Tonic, stimulant, and stomachic.—*Dose.* 1 to 2 fl. drs.

Tincture of Deadly Nightshade. Tincture of belladonna.

Tincture, De Costlogon's. Haffenden's tincture.

Tincture of *Digitalis*. Tincture of fox-glove.

Tincture of Elecampane'. *Syn.* TINCTURA INULÆ, T. HELENI, L. *Prep.* (P. Cod.) Powdered elecampane, 4 oz.; proof spirit, 1 pint; macerate for 15 days. Tonic, deobstruent, and expectorant.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.; in dyspepsia, palsy, dropsies, uterine obstructions, &c.

Tincture of Ergot. *Syn.* TINCTURA SECALII CORNU, TINCTURA ERGOTÆ (B. P., Ph. D.), L. *Prep.* 1. (B. P.) Ergot, bruised, 1; proof spirit, 4; macerate 48 hours with 3 of the spirit, agitating occasionally, pack in a percolator, let it drain, then pour on the remaining spirit; when it ceases to drop, wash the marc with the spirit to make up 4.—*Dose.* 15 to 60 minims.

2. (Apothecaries' Hall.) Ergot (ground in a coffee-mill), 2½ oz.; proof spirit, 1 pint; digest for 7 days.—*Dose.* A teaspoonful; to excite the action of the uterus in labour.

3. (Ph. D.) Ergot, 8 oz.; proof spirit, 1 quart; macerate for 14 days, and strain, with expression.—*Dose.* 20 drops to 1 fl. dr.; as the last.

Tincture of Ergot (Ethereal). *Syn.* TINCTURA ERGOTÆ ÆTHEREA (Ph. L.), L. *Prep.* (Ph. L.) Ergot, bruised, 15 oz.; ether, 1 quart; macerate for 7 days, press, and filter.—*Dose.* 10 drops to 1 fl. dr.

Tincture of Fox-glove. *Syn.* TINCTURA DIGITALIS (Ph. L. E. & D.), L. *Prep.* (Ph. L.) Dried foxglove leaves, 4 oz. (5 oz.—Ph. D.); proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.); or percolate—Ph. E.; then press, and strain.

Obs. This tincture is a powerful sedative, diuretic, and narcotic. The commencing dose should be 10 drops, gradually and cautiously increased to 30, or even 40; in asthmas, dropsies, fevers, phthisis, &c. "If 40 fl. oz. of spirit be allowed to pass (percolate) through, the sp. gr. will be .944; and the solid contents of 1 fl. oz. will amount to 24 gr." (Ph. E.)

Tincture of Galbanum. *Syn.* TINCTURA GALBANI, L. *Prep.* (Ph. D. 1826.) Galbanum, 2 oz.; proof spirit, 32 fl. oz.; digest 7 days. Stimulant and antispasmodic.—*Dose.* 1 to 3 fl. drs. "If less nauseous than tincture of assafoetida, it is also less powerful." (Dr. A. T. Thomson.)

Tincture of Galls. *Syn.* TINCTURA GALLÆ (B. P., Ph. L. & D.), TINCTURA GALLARUM (Ph. E.), L. *Prep.* 1. (B. P.) Galls, bruised, 1; proof spirit, 8; macerate for 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator, let it drain, and then pour on the remaining spirit; when it ceases to drop, wash the marc with spirit to make up 8.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.

2. (Ph. L.) Galls, in powder, 5 oz.; proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.); or percolate—Ph. E.; then express the liquid, and filter it. Astringent and styptic.—*Dose.* $\frac{1}{2}$ to 2 fl. drs. It is chiefly used as a test for iron.

Tincture of Gentian (Compound). *Syn.* BITTER STOMACHIC TINCTURE; TINCTURA GENTIANÆ COMPOSITA (B. P., Ph. L. E. & D.), TINCTURA AMARA, L. *Prep.* 1. (B. P.) Gentian, bruised, 1½; bitter orange peel, bruised, $\frac{3}{4}$; cardamom seeds, bruised, $\frac{1}{4}$; proof spirit, 20; macerate for 48 hours with 15 of the spirit, agitating occasionally, pack in a percolator, let it drain, and then pour on the remaining spirit; when it ceases to drop, wash the marc with spirit to make up 20.—*Dose.* 1 to 2 drs.

2. (Ph. L.) Gentian root, sliced and bruised, 2½ oz.; dried orange peel, 10 drs.; cardamoms, bruised, 5 drs.; proof spirit, 1 quart; macerate for 7 days (or percolate—Ph. E.). The Edinburgh College substitutes camella for cardamoms, and adds of cochineal, $\frac{1}{2}$ dr.

3. (Ph. D.) Gentian root, 3 oz.; dried bitter orange peel, 1½ oz.; cardamoms, $\frac{1}{2}$ oz.; proof spirit, 1 quart; macerate for 14 days.

4. (Wholesale.) Gentian, 2½ lbs.; dried orange peel, 1½ lb.; bruised cardamoms, 2½ lbs.; proof spirit, 4 galls. (or rectified spirit and water, of each, 2 galls.); digest as last.

Obs. This is an elegant and popular stomachic bitter and tonic.—*Dose.* 1 to 2 fl. drs.; in dyspepsia, loss of appetite, &c.

Tincture of Gentian (Ammoniated). *Syn.* TINCTURA GENTIANÆ AMMONIATÆ, L.; ELIXIR ANTISCROFULÆUX, Fr. *Prep.* (P. Cod.) Gentian, 1 oz.; sesquicarbonate of ammonia, $\frac{1}{2}$ oz.; proof spirit, 32 fl. oz. As the last; but preferred in acidity and low spirits.

Tincture of Ginger. *Syn.* TINCTURA ZINGIBERIS (B. P., Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Ginger, bruised, 1; rectified spirit, 8; macerate the ginger 48 hours in 6 of the spirit, agitating occasionally; pack in a percolator, let it drain, pour on the remaining spirit, and when it ceases to drop press, filter, and add spirit to make 8.—*Dose.* 10 to 30 minims.

2. (Ph. L.) Ginger, bruised, 2½ oz.; rectified spirit, 1 quart; macerate for 7 days (or percolate—Ph. E.).

3. (Wholesale.) Coarsely powdered unbleached Jamaica ginger, 1½ lb.; rectified spirit (or spirit distilled from the essence), 1½ gal.; water, $\frac{1}{2}$ gal.; digest as above. Stimulant and carminative.—*Dose.* 1 to 2 fl. drs.

Obs. The formula of the Ph. D. 1826 resembles the above; that of the last Ph. D. orders 8 oz. of ginger to 1 quart of rectified spirit. The product is, consequently, of fully 3 times the strength of that of the others; and is similar to the common ESSENCE OF GINGER of the shops.

Tincture, Gout. *Syn.* TINCTURA ANTARTHEUTICA, L. *Prep.* 1. (Dr. Graves's.) Take of dried orange peel and powder of aloes and

canella, of each, 2 oz.; rhubarb, 1 oz.; French brandy (or proof spirit), 1 quart; digest a week, and strain, with expression.—*Dose.* 1 to 2 teaspoonfuls, night and morning.

2. (Dr. Wilson's.) Tincture of colchicum flowers.

3. Tincture of colchicum.

Tincture of Guaiacum. *Syn.* TINCTURA GUAIACI (Ph. E. & D.), L. *Prep.* (Ph. E., & Ph. L. 1836.) Guaiacum resin (powdered), 7 oz. (8 oz.—Ph. D.); rectified spirit, 1 quart; digest for 14 days, and filter. An excellent sudorific; in chronic gout and rheumatism.—*Dose.* 1 to 3 fl. drs., taken in milk.

Tincture of Guaiacum (Compound). *Syn.* AMMONIATED TINCTURE OF GUAIACUM, VOLATILE T. OF G., RHEUMATIC DROPS; TINCTURA GUAIACI COMPOSITA (Ph. L.), T. G. AMMONIATA (B. P., Ph. E.), L. *Prep.* 1. (B. P.) Guaiac resin, in fine powder, 4; aromatic spirit of ammonia, 20; macerate 7 days, filter, and wash the filter with the spirit to make up 20.—*Dose.* $\frac{1}{2}$ to 1 dr., with 1 dr. of mucilage or yolk of egg, to form an emulsion.

2. (Ph. L.) Guaiacum, in coarse powder, 7 oz.; aromatic spirit of ammonia (spirit of ammonia—Ph. E.), 1 quart; digest for 7 days, and decant or filter. A powerful, stimulating sudorific and emmenagogue; in chronic rheumatism, gout, amenorrhoea, &c.—*Dose.* 1 to 2 fl. drs., in milk, or some viscid liquid.

Tincture, Haffenden's Balsamic. *Syn.* DE COETLOGON'S BALSAMII TINCTURE. This is a nostrum, of many virtues, prepared from tincture of serpentary (of double strength), $1\frac{1}{2}$ fl. oz.; compound of tincture of benzoïn, 1 fl. oz.; tinctures of tolu and opium, of each, $\frac{1}{2}$ fl. oz.; with rectified spirits, q. s. to render the mixture 'bright,' should it turn milky. ('Anat. of Quackery.')

Tincture, Hatfield's. *Prep.* From gum guaiacum and soap, of each, 2 drs.; rectified spirit, 1 pint; digest for a week. *Used* as TINCTURE OF GUAIACUM; also externally.

Tincture of Hellebore. *Syn.* TINCTURE OF BLACK HELLEBORE; TINCTURA HELLEBORI (Ph. L.), L. TINCTURA HELLEBORI NIGRI. *Prep.* (Ph. L.) Black hellebore root, bruised, 5 oz.; proof spirit, 1 quart; macerate 7 days, then strain, with expression.

Obs. This tincture is a powerful emmenagogue, and was a favourite remedy with Dr. Mead, in uterine obstructions and certain cutaneous affections.—*Dose.* 20 drops to $\frac{1}{2}$ fl. dr. See TINCTURE OF VERATRUM.

Tincture of Hemlock. *Syn.* TINCTURA CUCURBITÆ, T. CONII (Ph. L. & E.), T. CONII MACULATI, L. *Prep.* 1. (Ph. L.) Dried hemlock leaves, 5 oz.; proof spirit, 1 quart; digest a week, press, and filter. In the Ph. L. 1836, cardamom seeds, 1 oz., was added.

2. (Ph. E.) Fresh hemlock leaves, 12 oz.; express the juice, bruise the residuum, and treat it, by percolation, first with tincture of cardamoms, 10 fl. oz., and next with rectified spirit, $1\frac{1}{2}$ pint; mix the liquids, and filter.

Deobstruent and narcotic.—*Dose* of the Ph. L., 20 to 60 drops; that of the Ph. E. tincture is less, it being a much stronger and certain preparation. See HEMLOCK.

Tincture of Hemp. Tincture of Indian Hemp.

Tincture of Henbane. *Syn.* TINCTURA HYOSCYAMI (B. P., Ph. L. E. & D.). *Prep.* 1. (B. P.) Hyoscyamus leaves, dried and bruised, 1; proof spirit, 8; macerate 48 hours with 6 of the spirit, pack in a percolator, and when it has drained pour on the remaining spirit, and when it ceases to drop, press, and wash the marc with spirit to make up 8.—*Dose.* 15 to 60 minims.

2. (Ph. L.) Dried leaves of henbane, 5 oz.; proof spirit, 1 quart; macerate for 7 days (14 days.—Ph. D.; or percolate—Ph. E.), then press, and filter. Anodyne, sedative, soporific, and narcotic.—*Dose.* 20 drops to 2 fl. drs.

Obs. This, as well as the TINCTURES OF FOXGLOVE, HEMLOCK, HOPS, JALAP, LOBELIA INFLATA, RHATANY, SAVINE, SQUILLS, SENNA, VALERIAN WORMWOOD, &c., is usually prepared by the druggists with 1 lb. of the dried leaves (or dried drugs) to each gal. of a mixture of equal parts of rectified spirit and water.

Tincture of Hops. *Syn.* TINCTURA LUPULI (B. P., Ph. L. & E.), TINCTURA HUMULI, L. *Prep.* 1. (B. P.) Hop, 1; proof spirit, 8; macerate 48 hours in 6 of the spirit, agitating occasionally, pack in a percolator, let it drain, add the remaining spirit, and when fluid ceases to drop, wash the marc, filter, and make up 8.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. E.) Hops, 6 oz.; proof spirit, 1 quart; digest 7 days, then press, and filter. Anodyne, sedative, and soporific.—*Dose.* $\frac{1}{2}$ to 2 fl. drs. For the formula of the Ph. E. and D., see TINCTURE OF LUPULIN.

Tincture, Hudson's. Tooth tincture.

Tincture, Huxham's. Compound tincture of cinchona.

Tincture of Indian Hemp. *Syn.* TINCTURA CANNABIS INDICÆ (B. P.), TINCTURA CANNABIS, T. C. INDICÆ (Ph. D.), L. *Prep.* 1. (B. P.) Extract of Indian hemp, 1; rectified spirit, 20; dissolve.—*Dose.* 5 to 20 minims with 1 dr. of mucilage, adding 1 oz. of water.

2. (Ph. D.) Purified extract of Indian hemp, $\frac{1}{2}$ oz.; rectified spirit, $\frac{1}{2}$ pint; dissolve. 21 drops (minims) contains 1 gr. of the extract.

Obs. The formulæ of O'Shaughnessy and the Bengal Ph. are similar.—*Dose.* 10 drops, every $\frac{1}{2}$ hour, in cholera; 1 fl. dr., every $\frac{1}{2}$ hour, in tetanus, till the paroxysms cease, or catalepsy is induced.

Tincture of Indian Tobacco. Tincture of lobelia.

Tincture of Iodine. *Syn.* TINCTURA IODINÆ (Ph. E.), TINCTURA IODINII, L. *Prep.* (Ph. E.) Iodine, 2 $\frac{1}{2}$ oz.; rectified spirit, 1 quart; dissolve, and preserve it in well-closed bottles.—*Dose.* 5 to 30 drops, twice or

thrice daily, where the use of iodine is indicated. Externally, as a paint, &c.

Obs. The formulæ of Magendie, the Ph. U. S., and the Paris Codex, are similar.

Tincture of Iodine (Compound). *Syn.* ANTISCROFULOUS DROPS; TINCTURA IODI (B. P.), TINCTURA IODINII COMPOSITA (Ph. L. & D.), L. *Prep.* 1. Iodine, $\frac{1}{2}$; iodide of potassium, $\frac{1}{4}$; rectified spirit, 20; dissolve.—*Dose.* 5 to 20 minims. Also an excellent application to the throat in diphtheria.

2. (Ph. L. & D.) Iodine, 1 oz.; iodide of potassium, 2 oz.; rectified spirit, 1 quart; dissolve.—*Dose*, &c., as the last.

Tincture of Ipecacuanha. *Syn.* TINCTURA IPECACUANHA, L. *Prep.* (Ph. Bor.) Ipecacuanha (coarsely powdered), 1 oz.; spirit, sp. gr. .897 to .900 (16 to 17 o. p.), 8 oz.; macerate for 8 days. The tincture of the P. Cod. has twice its strength.—*Dose.* 10 or 12 drops to 2 fl. drs., according to the intention.

Tincture of Jalap. *Syn.* TINCTURA JALAPÆ (B. P., Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Jalap, in coarse powder, 1; proof spirit, 8; macerate for 48 hours in six of the spirit, agitating occasionally, pack in a percolator, and when the fluid ceases to pass, pour on the remaining spirit, press, filter, and add spirit to make 8.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. L.) Jalap, coarsely powdered, 5 oz. (10 oz.—Ph. L. 1836; 7 oz.—Ph. E.); proof spirit, 1 quart, (1½ pint.—Ph. D.); macerate for 7 days (or percolate—Ph. E.), then press, and filter. Carthartic.—*Dose.* 1 to 4 fl. drs.

Tincture of Kino. *Syn.* TINCTURA KINO (B. P., Ph. L. & E.), L. *Prep.* 1. (B. P.) Kino, in powder, 1; rectified spirit, 10; macerate 7 days, filter, and make up 10.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. L.) Powdered kino, 3½ oz.; rectified spirit, 1 quart; macerate for 7 days (or percolate—Ph. E.), and filter. Astringent.—*Dose.* 1 to 2 fl. drs., combined with chalk mixture; in diarrhoea, &c.

Tincture of Lactuca'rium. *Syn.* TINCTURA LACTUCARII, L. *Prep.* (Ph. E.) Powdered lactucarium, 4 oz.; proof spirit, 1 quart; digest or percolate. Anodyne, soporific, antispasmodic, and sedative.—*Dose.* 20 to 60 drops; in cases for which opium is unsuited. 10 drops (minims) contain 1 gr. of lactucarium.

Tincture of Lavender (Compound). *Syn.* RED LAVENDER, RED LAVENDER DROPS, RED HARTSHORN; TINCTURA LAVENDULÆ COMPOSITA (B. P., Ph. L. & D.), SPIRITUS LAVANDULÆ COMPOSITUS (Ph. E.), L. *Prep.* 1. (B. P.) English oil of lavender, 90 minims; English oil of rosemary, 10 minims; cinnamon, bruised, 150 grs.; nutmeg, bruised, 150 grs.; red sandal wood, 300 grs.; rectified spirit, 40 oz.; macerate the cinnamon, nutmeg, and red sandal-wood in the spirit for 7 days, then press out and strain; dissolve the oils in the strained

tincture and add sufficient rectified spirit to make 40 oz.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. L.) Cinnamon and nutmegs, of each, bruised, 2½ drs.; red sanders wood, sliced, 5 drs.; rectified spirit, 1 quart; macerate for 7 days, then strain, with expression, and dissolve in the strained liquid, oil of lavender, 1½ fl. dr., oil of rosemary, 10 drops.

3. (Ph. L. 1836.) Spirit of lavender, 1½ pint; spirit of rosemary, $\frac{1}{2}$ pint; red sanders wood (rasped), 5 drs.; cinnamon and nutmegs (bruised), of each, 2½ drs.; macerate for 14 days.

4. (Ph. E.) Spirit of lavender, 1 quart; spirit of rosemary, 12 fl. oz.; cinnamon, 1 oz.; nutmeg, $\frac{1}{2}$ oz.; red sanders, 3 drs.; cloves, 2 drs.; as No. 1.

5. (Ph. D.) Oil of lavender, 3 fl. drs.; oil of rosemary, 1 fl. dr.; cinnamon, 1 oz.; nutmegs, $\frac{1}{2}$ oz.; cloves and cochineal, of each, $\frac{1}{4}$ oz.; rectified spirit, 1 quart; macerate for 14 days.

6. (Wholesale.) From oil of cassia, $\frac{3}{4}$ fl. oz.; oil of nutmeg, 1 fl. oz.; oils of lavender and rosemary, of each, 4½ fl. oz.; red sanders (rasped), 3 lbs.; proof spirit, 6 galls. (or rectified spirit and water, of each, 3 galls.); digest 14 days. Should it be cloudy, add a little more proof spirit.

Obs. Compound tincture of lavender is a popular stimulant, cordial, and stomachic.—*Dose.* 1 to 3 teaspoonfuls ($\frac{1}{2}$ to 2 fl. drs.); in lowness of spirits, faintness, flatulence, hysteria, &c.

Tincture of Lem'ons. *Syn.* TINCTURA LIMONUM (Ph. L.), TINCTURA LIMONIS (B. P., Ph. D., Ph. L.), L. *Prep.* 1. (B. P.) Fresh lemon peel, sliced thin, 1; proof spirit, 8; macerate for 7 days in a closed vessel with occasional agitation, strain, press, filter, and make up with spirit to 8.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. Fresh lemon peel, 3½ oz. (cut thin, 5 oz.—Ph. D.); proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.), then express the liquid, and filter it. An aromatic bitter and stomachic.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.

Tincture of Lobe'lia. *Syn.* TINCTURE OF INDIAN TOBACCO; TINCTURA LOBELIÆ INFUSATE, TINCTURA LOBELIÆ (B. P., Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Lobelia, dried and bruised, 1; proof spirit, 8; macerate 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator, and let it drain, pour on the remaining spirit, and when it ceases to drop, press and wash the marc with spirit to make up 8.—*Dose.* 10 to 30 minims, but 1 dr. may be given for dyspnoea; 4 drs. as an emetic.

2. (Ph. L.) Dried and powdered lobelia infusa, 5 oz.; proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.; or percolate—Ph. E.), press, and filter.—*Dose.* As an expectorant, 10 to 60 drops; as an emetic and antispasmodic, 1 to 2 fl. drs., repeated every third hour until it causes vomiting. It is

principally employed in spasmodic asthma, and some other pulmonary affections.

Tincture of Lobelia (Ethereal). *Syn.* TINCTURA LOBELLE ETHEREA (B. P., Ph. L. & E.). *L. Prep.* 1. Lobelia, dried and bruised, 1; spirit of ether, 8; macerate 7 days, press, and strain 8.—*Dose.* 10 to 30 minims as an antispasmodic.

2. (Ph. L.) Indian tobacco, powdered, 5 oz.; ether, 14 fl. oz.; rectified spirit, 26 fl. oz.; macerate 7 days, press, and filter.

3. (Ph. E.) Dry lobelia, 5 oz.; spirit of sulphuric ether, 1 quart; by digestion for 7 days, or by percolation.—*Dose.* 6 or 8 drops to 1 fl. dr.

4. (Whitlaw's.) From lobelia, 1 lb.; rectified spirit and spirit of nitrous ether, of each, 4 pints; sulphuric ether, 4 oz.—*Dose*, &c., as the last.

Tincture of Lu'pulin. *Syn.* TINCTURE OF HOPS; TINCTURA LUPULI (Ph. E.), TINCTURÆ LUPULINÆ (Ph. D.). *L. Prep.* (Ph. D.) Lupulin (the yellowish-brown powder attached to the scales of hops, separated by friction and sifting), 5 oz.; rectified spirit, 1 quart; macerate for 14 days (or proceed by displacement—Ph. E.), press, and filter.—*Dose.* $\frac{1}{2}$ to 2 fl. drs. See TINCTURE OF HOPS.

Tincture of Mat'ico. *Syn.* TINCTURA MATICO (Ph. D.), *L. Prep.* (Ph. D.) Matico leaves, in coarse powder, 8 oz.; proof spirit, 1 quart; macerate for 14 days, and strain, with expression.—*Dose.* $\frac{1}{2}$ to 2 fl. drs., as an internal astringent or hæmostatic. It is a very feeble remedy, as matico leaves are destitute of either tannin or gallic acid, and derive their power of stopping local bleeding from the peculiar mechanical construction of their surface.

Tincture of Mea'dow Saffron. Tincture of colchicum.

Tincture of Mones'ia. *Syn.* TINCTURA MONESIAE, *L. Prep.* From monesia, 2½ oz.; proof spirit, 1 pint; macerate a week. Astringent.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.

Tincture of Musk. *Syn.* TINCTURA MOSCHI, *L. Prep.* (Ph. D. 1826.) Musk, 2 drs.; rectified spirit, 16 fl. oz.; digest 7 days. Antispasmodic; but principally used as a perfume, being too weak for medical use.

Tincture of Myrrh. *Syn.* GOLDEN TOOTH-DROPS; TINCTURÆ, (B. P., Ph. L. E. & D.), *L. Prep.* 1. (B. P.) Myrrh, in coarse powder, 1; rectified spirit, 8; macerate 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator, and when it ceases to drop, pour on the remaining spirit, wash the marc, press, and make up to 8.—*Dose.* $\frac{1}{2}$ to 1 dr. More frequently used mixed with water to form a gargle.

2. (Ph. L.) Myrrh, in powder, 3 oz. (3½ oz., Ph. E.; 4 oz.,—Ph. D.; rectified spirit, 1 quart; macerate for 7 days (14 days,—Ph. D.; or by displacement—Ph. E.), and filter.

3. (Wholesale.) Myrrh (in coarse powder),

2½ lbs.; rectified spirit, 2 galls.; water, 1 gal.; as the last.

Obs. Tincture of myrrh is tonic and stimulant.—*Dose.* $\frac{1}{2}$ to 1 fl. dr., as an adjuvant in mixtures, gargles, &c. Chiefly used diluted with water, as a dentifrice or wash for ulcerated and spongy gums.

Tincture of Myrrh. (Compound). *Syn.* TINCTURA MYRRHE COMPOSITA, *L. Prep.* From myrrh and Socotrine aloes, of each, 2 lbs.; rectified spirit, 3 galls.; water, 2 galls.; digest for 14 days. This is frequently substituted for 'COMPOUND TINCTURE OF ALOES' in the wholesale trade.

Tincture of Nux Vom'ica. *Syn.* TINCTURA NUCIS VOMICÆ, *L. Prep.* 1. Nux vomica, 1 rectified spirit, 10; soften the nux vomica by steam, dry rapidly, and reduce to fine powder. Macerate 48 hours in three fourths of the spirit, agitating occasionally, pack in a percolator, let it drain, pour on the remaining spirit, and when it ceases to drop, press, filter, and make up to 10.—*Dose.* 10 to 30 minims.

2. (Ph. D. 1826.) Nux vomica (ground in a coffee-mill), 2 oz.; rectified spirit, 8 fl. oz.; macerate 7 (14) days.—*Dose.* 5 to 20 drops; in paralysis, &c. It is poisonous.

Tincture, Odontalgic. *Syn.* TOOTHACHE TINCTURE; TINCTURA ODONTALGICA, *L. Prep.*

1. Tincture of opium, 1 fl. dr.; ether, 2 fl. drs.; oil of cloves, 15 drops.

2. Rectified spirit, 3 fl. drs.; chloroform, 2 drs.; creasote, 1 dr.; mix.

3. (Collier.) Pellitory of Spain, 4 drs.; camphor, 3 drs.; opium, 1 dr.; oil of cloves, 2 fl. drs.; rectified spirit, 16 fl. oz.; digest for a week.

4. (Niemanh.) Digest 60 or 80 common lady-birds (*Coccinella septempunctata*,—Linn.) in rectified spirit, 1 fl. oz., for 8 days, and strain.

Obs. The above are commonly applied, on a small piece of lint, in toothache. For other formulæ see DROPS, TINCTURES OF MYRRH and PELLITORY, &c.

Tincture of O'pium. *Syn.* LAUDANUM, LIQUID, *L.*, ANODYNE TINCTURE, THEBAIC T.; TINCTURA OPII, (B. P., Ph. L. E. & D.), THEBAICA, LAUDANUM LIQUIDUM, *L. Prep.*

1. (B. P.) Opium in coarse powder, 1½; proof spirit, 20; macerate 7 days, strain, express, filter, and add spirit to make 20.—*Dose.* 10 to 30 minims.

2. (Ph. L.) Powdered opium, 3 oz. (3 oz.—Ph. D.); proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.), and strain, with expression.

3. (Ph. E.) Opium, sliced, 3 oz.; boiling water, 13½ fl. oz.; digest, with heat, for 2 hours, break down the opium with the hand, strain, and express the infusion; then macerate the residuum for about 20 hours in rectified spirit, 1 pint 7 fl. oz.; next strain, press, mix the watery and spirituous infusions, and filter.

Obs. This preparation has a deep brownish-red colour, and the characteristic odour and taste of opium. 14 minims or measured drops of the London, and about 15 minims of the Edinburgh and Dublin tinctures, are equivalent to 1 gr. of dry opium, or 1.12 gr. of ordinary opium. 14 minims of this tincture are equal to about 25 drops of it poured from a bottle. Its sp. gr. is .952. (Phillips).—*Dose.* 10 to 60 drops; as an anodyne, sedative, or hypnotic. The following form is substituted for that of the Pharmacopœia by many of the wholesale drug houses:—Take of Turkey opium, 2½ lbs.; boiling water, 9 quarts; digest till dissolved or disintegrated, cool; add of rectified spirit, 2 galls.; and, after repose for 24 hours, decant the clear portion. *Prod.* 4 galls.

Tincture of Opium (Ammoniated). *Syn.* AMMONIATED TINCTURE OF OPIUM, SCOTCH PAREGORIC; TINCTURA OPII AMMONIATA (B. P., Ph. E.), L. *Prep.* 1. (B. P.) Opium in powder, 100 grs.; saffron, cut small, 180 grs.; benzoic acid, 180 grs.; oil of anise, 60 minims; strong solution of ammonia, 4 oz.; rectified spirit, 16 oz.; macerate 7 days in a closed vessel, with occasional agitation, strain, and add sufficient rectified spirit to make up 20 oz.—*Dose.* ½ to 1 dr.

2. (Ph. E.) Benzoic acid and hay saffron, of each, 6 drs.; opium, sliced, 4 drs.; oil of aniseed, 1 dr.; spirit of ammonia (Ph. E.), 1 quart; digest for a week, and filter. Stimulant, antispasmodic, and anodyne.—*Dose.* 20 to 80 drops; in hysteria, whooping-cough, &c.

Obs. This preparation is called 'PAREGORIC,' or 'PAREGORIC ELIXIR,' in Scotland, but should be carefully distinguished from the compound tincture of camphor, which passes under the same names in England; as the former contains about 4 times as much opium as the latter. 80 minims, or 145 poured drops, contain about 1 gr. of opium.

Tincture of Opium (Camphorated). Compound tincture of camphor.

Tincture of Orange Peel. *Syn.* TINCTURA AURANTII (B. P., Ph. L. E. & D.), T. CORTICIS AURANTII, L. *Prep.* 1. (B. P.) Dried bitter orange peel, cut small and bruised, 1; proof spirit, 10; macerate for 7 days in a closed vessel with occasional agitation, then strain, press, and filter, add sufficient proof spirit to make 10.—*Dose.* 1 to 2 drs.

2. (Ph. L.) Dried orange peel, 3½ oz. (4 oz.—Ph. D.); proof spirit, 1 quart; digest for 7 days (14 days—Ph. D.; or by percolation—Ph. E.), press, and filter. A grateful bitter stomachic.—*Dose.* 1 to 3 fl. drs.; chiefly as an adjuvant in mixtures, &c.

Tincture of Pellitory. *Syn.* TOOTHACHE TINCTURE; TINCTURA PYRETHRÆ, B. P. *Prep.* 1. (B. P.) Pellitory root, in coarse powder, 4; rectified spirit, 20; macerate for 48 hours with 15 of the spirit, agitating occasionally, then pack in a percolator, let it drain, and pour on the remaining spirit; when it ceases to drop, press, filter, and make up to 20.

2. Pellitory of Spain (bruised), 1 oz.; rectified spirit, ¼ pint; digest a week. In the P. Cod. a tincture is ordered prepared with spirit about 41 o. p., and another prepared with spirit of sulphuric ether.

3. (COMPOUND.—Brande.) Pellitory root, 4 drs.; camphor, 3 drs.; oil of cloves, 2 drs.; opium, 1 dr.; rectified spirit, 6 fl. oz.; digest for eight days. Both the above are used for the toothache. See ODONTALGIC TINCTURE.

Tincture of Phosphorus (Ethereal). *Syn.* ÆTHER PHOSPHORATUS, TINCTURA PHOSPHORI ÆTHEREA, L. *Prep.* 1. Ph. Hann. 1881.) Phosphorus (powdered by agitation with rectified spirit), 16 grs.; ether, 2 oz.; macerate, with agitation, for 4 days, then decant the clear portion, and preserve it in a stoppered bottle, in a cool dark situation.

2. (P. Cod.) Phosphorus, cut small, 1 part; ether, 50 parts; digest, with occasional agitation, for 1 month, and decant the clear.—*Dose.* 5 to 15 drops, in any bland vehicle, thrice daily; in impotency, low sinking conditions of the system, &c.

Tincture of Quassia. *Syn.* TINCTURA QUASSIÆ (B. P., Ph. E.), L. *Prep.* 1. (B. P.) Quassia in chips, ½; proof spirit, 20; digest 7 days, filter, and make up to 20.—*Dose.* 1 to 2 drs.

2. (Ph. E.) Quassia, in chips, 10 drs.; proof spirit, 1 quart; digest 7 days. Bitter, tonic.—*Dose.* ½ to 2 fl. drs.; in dyspepsia, &c.

Tincture of Quassia (Compound). *Syn.* TINCTURA QUASSIÆ COMPOSITA (Ph. E.), L. *Prep.* (Ph. E.) Cardamoms and cochineal, of each, bruised, ½ oz.; powdered cinnamon and quassia chips, of each, 6 drs.; raisins, 7 oz.; proof spirit, 1 quart; digest for 7 days (or by percolation), then press, and filter. Aromatic and tonic.—*Dose* and *use*, as the last.

Tincture of Quinine (Compound). *Syn.* FEVER DROPS; TINCTURA QUININÆ, B. P.; TINCTURA QUININÆ COMPOSITA (Ph. L.) *Prep.* 1. (B. P.) Sulphate of quinia, 1; tincture of orange peel, 60; dissolve with a gentle heat, digest for 3 days with occasional agitation, and strain.—*Dose.* 1 to 1½ dr.

2. (Ph. L.) Sulphate of quinine, 5 drs. 1 scrup. (or 320 grs.); tincture of orange peel, 1 quart; digest, with agitation, for 7 days, or until solution is complete.

Obs. Unless the tincture employed as the solvent be of the full strength, some of the disulphate remains undissolved. It is an excellent medicine when faithfully prepared.—*Dose.* ½ to 2 fl. drs.; in debility, dyspepsia, &c.

Tincture of Red Lavender. Compound tincture of lavender.

Tincture of Rhatany. *Syn.* TINCTURA KRAMERIÆ (B. P., Ph. D.), L. *Prep.* 1. (B. P.) Rhatany, bruised, 1; proof spirit, 8; macerate 48 hours in 6 of the spirit, agitating occasionally, pack in a percolator; when it ceases to drop, pour on the remaining spirit,

and wash the marc with spirit to make up 8.—*Dose.* 1 to 2 drs.

2. (Ph. D.) Rhatany root, in coarse powder, 8 oz.; proof spirit, 1 quart; macerate for 14 days, then press, and filter. Astringent.—*Dose.* 1 to 2 fl. drs. The formula of the Ph. U. S. is similar.

Tincture of Rhubarb. *Syn.* TINCTURA RHEI (B. P., Ph. E.), L. *Prep.* 1. (B. P.) Rhubarb, bruised, 2; cardamom seeds, bruised, $\frac{1}{2}$; coriander, bruised, $\frac{1}{2}$; saffron, $\frac{1}{4}$; proof spirit, 20; macerate for 48 hours with 15 of the spirit, agitating occasionally, pack in a percolator, and when it ceases to drop pour on the remaining spirit, press and wash the marc, and add spirit to make up 20.—*Dose.* As a stomachic, 1 to 2 drs.; as a purgative, $\frac{1}{2}$ to 1 oz.

2. (Ph. E.) Powdered rhubarb, 3½ oz.; cardamom seeds, bruised, $\frac{1}{2}$ oz.; proof spirit, 1 quart; digest, or proceed by the method of displacement.

3. (Ph. L. 1824.) Rhubarb, 2 oz.; cardamoms, 4 drs.; saffron, 2 drs.; proof spirit, 32 fl. oz. Both the above are cordial, stomachic, and laxative.—*Dose.* 1 fl. dr. to 1 fl. oz.

Tincture of Rhubarb (Compound). *Syn.* TINCTURA RHEI COMPOSITA (Ph. L. & D.) *Prep.* 1. (Ph. L.) Rhubarb, sliced, 2½ oz.; liquorice root, bruised, 6 drs.; ginger (bruised) and hay saffron, of each, 3 drs.; proof spirit, 1 quart; macerate for 7 days, then press, and filter.

2. (Ph.) Rhubarb, 3 oz.; cardamoms, 1 oz.; liquorice root, $\frac{1}{2}$ oz.; saffron, $\frac{1}{4}$ oz.; proof spirit, 1 quart; macerate for 14 days.

3. (Ph. L.) 1824. Rhubarb, 2 oz.; liquorice root, 4 drs.; ginger and saffron, of each, 2 drs.; proof spirit, 16 fl. oz.; water, 12 fl. oz.

Obs. This tincture is a popular remedy in diarrhoea and colic, and is an especial favourite with drunkards.—*Dose.* as a stomachic, 1 to 3 fl. drs.; as a purgative, $\frac{1}{2}$ to 1½ fl. oz. The tincture of rhubarb of the shops is mostly inferior, being generally deficient both in rhubarb and spirit. The following forms we have seen extensively employed in the wholesale trade:—East Indian rhubarb, 20 lbs.; boiling water, q. s. to cover it; infuse for 24 hours, then slice the rhubarb, and put it into a cask with moist sugar, 14 lbs.; ginger, bruised, 3½ lb.; hay saffron, 1 lb.; carbonate of potash, $\frac{1}{2}$ lb.; bruised nutmegs, $\frac{1}{4}$ lb.; rectified spirit, 19 galls.; water, 21 galls.; macerate with frequent agitation for 14 days, decant the clear portion, and press and filter the bottoms. Those houses that adhere to the Ph. L. for 1824 substitute cardamom seeds, 5 lbs., for the ginger. For the corresponding Ph. E. formula see the last article.

Tincture of Rhubarb (Brandish's Alkaline). *Syn.* TINCTURA RHEI ALKALINA BRANDISHII, L. *Prep.* From rhubarb, in coarse powder, 1½ oz.; Brandish's alkaline solution, 1 quart; macerate for a week. In the original formula only ½ oz. of rhubarb is

ordered.—*Dose.* 20 drops to 2 fl. drs., in any bland liquid, not acidulous; in acidities, dyspepsia, &c.

Tincture of Rhubarb and Aloes. *Syn.* SACRED ELIXIR†; TINCTURA RHEI ET ALÖES, (Ph. E.), L. *Prep.* (Ph. D.) Rhubarb, in powder 1½ oz.; Socotrine or East Indian aloes, 6 drs.; cardamom seeds, bruised, 5 drs.; proof spirit, 1 quart; macerate 7 days, or percolate. A warm stomachic purgative.—*Dose.* $\frac{1}{2}$ fl. oz. to 1 fl. oz.

Tincture of Rhubarb and Gentian. TINCTURA RHEI AMARA, TINCTURA RHEI ET GENTIANÆ (Ph. E.), L. *Prep.* (Ph. E.) Rhubarb, 2 oz.; gentian, $\frac{1}{2}$ oz.; proof spirit, 1 quart; proceed as for the last. Stomachic, tonic, and purgative.—*Dose.* 1 fl. dr. to 1 fl. oz.

Tincture of Rhubarb and Sen'na. *Syn.* WARNER'S GOUT CORDIAL; TINCTURA RHEI ET SENNÆ (Ph. U. S.), L. *Prep.* (Ph. U. S.) Rhubarb, 1 oz.; senna and red sanders wood, of each, 2 drs.; coriander and fennel seed, of each, 1 dr.; saffron and extract of liquorice, of each, $\frac{1}{2}$ dr.; stoned raisins, 6 oz.; proof spirit, 2½ pints; macerate for 14 days. A popular stomachic and laxative.—*Dose.* $\frac{1}{2}$ to 1½ fl. oz.

Tincture, Riemer's Nervous. *Prep.* From oil of juniper, 1 part; volatile liquor of harts-horn, 4 parts; rectified spirit, 16 parts.—*Dose.* 1 teaspoonful, in water.

Tincture, Ruspini's. Tooth tincture.

Tincture of Saffron. *Syn.* TINCTURA CROCI (B. P., Ph. E. & D.), T. C. SATIVÆ, L. *Prep.* 1. (B. P.) Saffron, 1; proof spirit, 20; macerate 48 hours with 15 of the spirit, agitating occasionally, pack in a percolator, let it drain, and then pour on the remaining spirit; when it ceases to drop, wash the marc with spirit, to make up 20.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. E.) Hay saffron, 2 oz. (2 oz.—Ph. D.); proof spirit, 1 quart (1 pint—Ph. D.); proceed either by maceration (for 14 days—Ph. D.) or by displacement. Stimulant, and emmenagogue.—*Dose.* 1 to 2 fl. drs. Chiefly used for its colour and flavour.

Tincture of Senna (Compound). *Syn.* TINCTURA OF SENNA, ELIXIR OF HEALTH†; TINCTURA SENNÆ (B. P.), TINCTURA SENNÆ COMPOSITÆ (Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Senna, broken small, 5; raisins, freed from seeds, 4; caraway, bruised, 1; coriander, bruised, 1; proof spirit, 40; macerate the ingredients 48 hours in three fourths of the spirit, agitating occasionally; pack in a percolator, and when it ceases to drop, pour on the remaining spirit; press, filter, and make up 40.—*Dose.* 2 to 8 drs.

2. (Ph. L.) Senna, 3½ oz.; caraway seeds, bruised, 3½ drs.; cardamom seeds, bruised, 1 dr.; stoned raisins, 5 oz.; proof spirit, 1 quart; macerate for 7 days, press, and filter.

3. (Ph. E.) Senna and stoned raisins, of each, 4 oz.; sugar, 2½ oz.; corianders, 1 oz.;

jalap, 6 drs.; caraways and cardamoms, of each, 5 drs.; proof spirit, 1 quart; digest, or proceed by percolation.

4. (Ph. D.) Senna, 4 oz.; caraway and cardamom seeds, of each, bruised, $\frac{1}{2}$ oz.; proof spirit, 1 quart; macerate for 14 days.

5. (Wholesale.) From senna, 6 lbs.; treacle, 2 lbs.; caraways, $\frac{3}{4}$ lb.; cardamoms, $\frac{1}{4}$ lb.; rectified spirit and water, of each, 4 galls.; as before. Carminative, stomachic, and purgative.—*Dose.* $\frac{1}{4}$ to 1 fl. oz.

Obs. "If Alexandrian senna be used for this preparation, it must be freed from cynanchum (argel) leaves, by picking." (Ph. E.)

Tincture of Serpentry. *Syn.* TINCTURE OF VIRGINIAN SNAKE ROOT; TINCTURA SERPENTARIA (B. P., Ph. L. & E.), L. *Prep.* 1. (B. P.) Serpentry, bruised, 1; proof spirit, 8; macerate 48 hours, with 6 of the spirit, agitating occasionally, pack in a percolator and let it drain; pour on the remaining spirit, and when it ceases to drop, press, and wash the marc to make up 8.—*Dose.* $\frac{1}{2}$ to 2 drs.

2. (Ph. L.) Serpentry, bruised, 3 $\frac{1}{2}$ oz. (cochineal, 1 dr.—Ph. E.); proof spirit, 1 quart; macerate for 7 days (or by percolation—Ph. E.), strain, and filter. Stimulant, tonic, and diaphoretic.—*Dose.* 1 to 3 fl. drs.

Tincture of Sesquichloride of Iron. *Syn.* TINCTURE OF MURIATE OF IRON, TINCTURE OF STEEL, STEEL DROPS; TINCTURA FERRI PERCHLORIDI (B. P.), TINCTURA FERRI SESQUICHLORIDI (Ph. L. & D.), T. FERRI MURIATIS (Ph. E.), FERRI MURIATIS LIQUOR, L. *Prep.* 1. (B. P.) Strong solution of perchloride of iron, 1; rectified spirit, 3: mix.—*Dose.* 10 to 30 minims in water.

2. (Ph. L.) Sesquioxide of iron, 6 oz.; hydrochloric acid, 1 pint; mix, and digest in a sand bath, frequently shaking (with a gentle heat, for a day—Ph. E.), until solution is complete, then add, when cold, of rectified spirit, 3 pints, and (in a short time) filter. Sp. gr. .992. "1 fl. oz., potash being added, deposits nearly 30 grs. of sesquioxide of iron." (Ph. L.)

3. (Ph. D.) Iron wire, 8 oz.; pure hydrochloric acid, 1 quart; distilled water, 1 pint; mix, and dissolve by a gentle heat; next add, in successive portions, of pure nitric acid, 18 fl. drs.; evaporate by a gentle heat to a pint, and, when cold, mix this in a bottle with rectified spirit, 1 $\frac{1}{2}$ pint; lastly, after 12 hours, filter. Sp. gr. 1.237.

Obs. This tincture is an active ferruginous tonic.—*Dose.* 10 to 30 drops, gradually increased, taken in water, ale, or wine. In the old tinctura martis, Ph. L., iron filings, and in the T. ferri muriatis, Ph. E. 1817, black oxide of iron, were used instead of the sesquioxide or carbonate. Bestuchef's nerveine tincture of the P. Cod. is prepared by dissolving 1 dr. of dry sesquichloride of iron in 7 drs. of spirit of sulphuric ether. See GOLDEN DROPS.

Tincture of Sesquinitrate of Iron. *Syn.* TINCTURA FERRI SESQUINITRATIS, L. *Prep.* (Onion.) Iron filings, $\frac{1}{2}$ oz.; nitric acid (1.5), 2 $\frac{1}{2}$ oz.; dissolve, add of hydrochloric acid (1.16), 6 drs., simmer for 2 or 3 minutes, cool, add of rectified spirit, 8 oz., and filter. Proposed as a substitute for the last preparation, but the name misrepresents its chemical constitution.

Tincture of Squills. *Syn.* TINCTURA BRONCHICA, TINCTURA SCILLÆ (B. P., Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Dried squill, bruised 1; proof spirit, 8; macerate for 48 hours with 6 of the spirit, agitating occasionally, pack in a percolator, let it drain, and pour on the remaining spirit; when it ceases to drop, press, filter, and make up to 8.—*Dose.* 15 to 30 minims.

2. (Ph. L.) Squills, recently dried and sliced (or in coarse powder), 5 oz.; proof spirit, 1 quart; macerate for 7 days (14 days—Ph. D.; or by percolation—Ph. E.), press and filter. A stimulating expectorant and diuretics.—*Dose.* 10 to 30 drops; in chronic coughs, and other bronchial affections.

Tincture, Stomachic. Compound tincture of cardamoms. Compound tincture of gentian is also, occasionally, so called.

Tincture of Stramonium. *Syn.* TINCTURE OF THORN-APPLE; TINCTURA STRAMONII (B. P., Ph. D. & U. S.), L. *Prep.* 1. (B. P.) Stramonium seeds, bruised, 1; proof spirit, 8; macerate 48 hours with 6 of the spirit, agitating occasionally; pack in a percolator, let it drain, and pour on the remaining spirit. When it ceases to drop, press, filter, and add spirit to make 8.—*Dose.* 10 to 20 minims.

2. (Ph. D.) Stramonium or thorn-apple seeds (bruised), 5 oz.; proof spirit, 1 quart; macerate for 14 days (or by displacement—Ph. U. S.), then press, and filter. Anodyne.—*Dose.* 10 to 20 drops; in neuralgia, rheumatism, &c. Said to be superior to laudanum.

Tincture of Sumbul. *Syn.* TINCTURA SUMBULI, B. P. *Prep.* 1. (B. P.) Sumbul, bruised fine, 1; proof spirit, 8; digest 7 days and filter.—*Dose.* 15 to 30 minims.

2. From sumbul, bruised, 5 oz.; proof spirit, 1 quart; macerate for a week, and strain, with expression. Stimulant and tonic.—*Dose.* 10 to 30 or 40 drops.

Tincture of Thorn-apple. Tincture of stramonium.

Tincture of Tobacco. *Syn.* TINCTURA NICOTIANÆ, TINCTURA TABACI, L. *Prep.* From pure manufactured tobacco, 1 $\frac{1}{4}$ oz.; proof spirit, 1 pint; macerate for 7 days. Compound spirit of juniper is often used instead of proof spirit. Sedative and narcotic.—*Dose.* 10 to 30 drops. A tincture is also made from the fresh leaves. See VEGETABLE JUICES and TINCTURES (Ethereal).

Tincture of Tolu. *Syn.* TINCTURA TOLUTANUS (B. P.), TINCTURA TOLUTANA (Ph. L. & D.), T. BALSAMI TOLUTANI, T. TOLUIFERÆ BALSAMI, L. *Prep.* 1. (B. P.) Balsam of tolu, 1; rectified spirit, 8; dissolve, filter, and

make up to 8.—*Dose.* 15 to 30 minims, mixed with mucilage or syrup.

2. (Ph. L.) Balsam of Tolu, 2 oz. (3½ oz.—Ph. E.); rectified spirit, 1 quart (1 pint—Ph. D.); dissolve (by the aid of a gentle heat—Ph. E. & D.), and filter.

Obs. This tincture is reputed pectoral and expectorant; but it is chiefly used as an adjuvant in mixtures, on account of its flavour.—*Dose.* 10 to 60 drops.

Tincture, Tooth. *Prep.* 1. (Greenhough's.) From bitter almonds, 2 oz.; Brazil wood, cinnamon, and orris root, of each, ½ oz.; alum, cochineal, and salt of sorrel, of each, 1 dr.; spirit of scurvy grass, 2 fl. oz.; proof spirit, 1½ pint; macerate a week.

2. (Hudson's.) From the tinctures of myrrh and cinchona, and cinnamon water, equal parts, with a little arquebusade and gum arabic.

3. (Ruspini's.) From orris root, 8 oz.; cloves, 1 oz.; ambergris, 20 grs.; rectified spirit, 1 quart; digested for 14 days. The above are used as cosmetics for the teeth and gums. The last has long been a popular dentifrice.

Tincture, Toothache. Odontalgic tincture. See also DROPS, ESSENCE, &c.

Tincture of Valerian. *Syn.* TINCTURA VALERIANÆ (B. P., Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Valerian bruised, 1; proof spirit, 8; macerate the valerian 48 hours with 6 of the spirit, agitating occasionally; pack in a percolator, let it drain, pour on the remainder of the spirit; when it ceases to drop, press and filter, washing the marc with spirit to make up 8.—*Dose.* 1 to 2 drs.

2. (Ph. L.) Valerian root, bruised, 5 oz.; proof spirit, 1 quart; macerate 7 days (14 days—Ph. D.; or by percolation—Ph. E.), press, and filter. Tonic and antispasmodic.—*Dose.* 1 to 3 fl. drs.; in hysteria, epilepsy, &c.

Tincture of Valerian (Compound). *Syn.* AMMONIATED TINCTURE OF VALERIAN, VOLATILE T. OF V.; TINCTURA VALERIANÆ COMPOSITA (Ph. L.), T. V. AMMONIATA (B. P., Ph. E.), L. *Prep.* 1. (B. P.) Valerian, bruised, 1; aromatic spirit of ammonia, 8; macerate the valerian 7 days, press, filter, and add spirit to make up 8.—*Dose.* ½ to 1 dr.

2. (Ph. L.) Valerian root, bruised, 5 oz.; aromatic spirit of ammonia (simple—Ph. E.), 1 quart; macerate for 7 days (or, by percolation—Ph. E.), then press, and filter. Stimulant, tonic, and antispasmodic.—*Dose* and *use*, same as those of the simple tincture, than which it is thought to be more powerful. The tincture of the shops is generally made with only 1 lb. of the root to the gallon.

Tincture of Vera'trum. *Syn.* TINCTURE OF WHITE HELLEBORE; TINCTURA VERATRI VIRIDIS; TINCTURA HELLEBORI ALBI, T. VERATRI (Ph. E.), L. *Prep.* 1. (B. P.) Green hellebore root, in coarse powder, 4; rectified spirit, 20; macerate the powder with 15 of the spirit 48 hours, agitating occasionally, pack it in a per-

colator, let it drain, pour on the remainder of the spirit, when it ceases to drop, press, filter, wash the marc with spirit to make up 20.—*Dose.* 5 to 20 minims.

2. (Ph. E.) White hellebore, 4 oz.; proof spirit, 1 pint; digest or percolate.—*Dose.* 10 drops, 2 or 3 times a day, gradually increased; in gout, rheumatism, &c., as a substitute for colchicum; also, externally.

Tincture of Virginian Snake Root. Tincture of serpentary.

Tincture of Vittie-vayr. *Syn.* TINCTURA VETIVERIÆ, L. *Prep.* From vittie-vayr (roots of *Andropogon muricatis*), 2½ oz.; proof spirit, 1 pint; macerate a week. Stimulant, tonic, and sudorific.—*Dose.* 15 to 30 drops.

Tincture, Warburg's Fever. *Syn.* TINCTURA FEBRIFUGA WARBURGII. According to M. Fuchs, this tincture may be exactly imitated as follows:—Take of hepatic Æloes and zedoary root, of each, 1 dr.; saffron, 3 grs.; angelica root and camphor, of each, 2 grs.; spirit (897, or about 18 o. p.), 3 oz.; make a tincture (which should be 25 drs.), and dissolve in it (by the aid of a gentle heat), 30 grs. of sulphate of quinine. It is put up in 5-dr. bottles, each of which contains a dose, and is sold at about 5s. English. If the spirit be weaker than 18 or 20 o. p., some of the sulphate remains undissolved.

TINCTURES (Concentrated). *Syn.* TINCTURÆ CONCENTRATÆ HÆNLI, L. *Prep.* (Ph. Baden.) Digest 8 parts of the vegetable powder in 16 of spirit of the sp. gr. 857 (45 o. p.), for 4 days, at 72° Fahr., with occasional agitation, then press, and filter; to the marc or residuum add as much spirit as it has absorbed, and again press, and filter; the weight of the mixed liquors should be 16 parts. In this way are prepared concentrated tinctures of aconite leaves; arnica and chamomile flowers; belladonna, digitalis, hemlock, henbane, peppermint, and savine leaves; ipecacuanha and valerian roots, &c.

TINCTURES (Cu'inary). See ESSENCES, SPIRITS, &c.

TINCTURES (Eth'e'real). *Syn.* TINCTURÆ ÆTHEREÆ, L. *Prep.* (P. Cod.) From the vegetable substance, 1 oz.; sulphuric ether, 4 oz. (or 6 fl. oz.); by maceration, for 4 days, in a well-closed vessel; or, preferably, by percolation in a cylindrical glass vessel furnished with a stopper, and terminating at the lower end in a funnel, obstructed with a little cotton. The powder being introduced over the cotton, pour on enough ether to moisten it, put in the stopper, fix the tube into the neck of a bottle, and leave it for 48 hours; then add, gradually, the remaining portion of the ether, and, lastly, enough water to displace the ether absorbed. In this manner are prepared the ethereal tinctures of aconite leaves, arnica flowers, belladonna, hemlock, foxglove, tobacco, pellitory, solanum, valerian, stramonium, &c., of the Paris Codex.

The ethereal tinctures of amber, ambergris,

ssafoetida, cantharides (acetic ether), castor, musk, tolu, &c., are prepared by maceration only.

TINCTURES (Odoriferous). These are prepared from odoriferous substances by the usual processes of digestion or percolation. See **SPIRITS**.

TINCTURES from Recent Vegetables. See **VEGETABLE JUICES**.

TIN'DER (German). See **AMADOU**.

TISANE. [Fr.] *Syn.* PTISAN; PTISANA, L. This form of medicine is much used in France. Tisanes may be readily prepared by slightly medicating barley, rice, or tamarind water, lemonade, &c. See **DECOCTION**, **INFUSION**, **JULEP**, **PTISAN**, &c., and below.

Tisane Antiscorbutique. An infusion of buckbean and the fresh roots of horseradish.

Tisane Antivexerienne. Various compound decoctions of sarsaparilla are known by this name.

Tisane Commune. A decoction of pearl-barley and couch-grass, flavoured with liquorice root.

Tisane Pectorale. An infusion of the roots of liquorice and marsh-mallow, Canadian maiden-hair, and the flowers of the red poppy and coltsfoot, in a decoction of rice.

Tisane Royale. From senna, fresh chervil, and sulphate of soda, of each, 4 drs.; aniseed and cinnamon, of each, 1 dr.; 1 lemon, sliced; cold water, 1½ pint; macerate for 24 hours, stirring occasionally, then press and filter. *Aperient*.—*Dose*. A wine-glassful, or more, repeated every half-hour, until it operates.

TIS'SUE (Blist'ering). See **VESICANTS**.

TITANIUM. A rare metal, discovered by Klapproth in 1794, and examined by Wollaston in 1822. It is occasionally found at the bottom of the smelting furnaces of iron works, in combination with nitrogen and cyanogen, under the form of minute crystals, having a coppery lustre.

TOAST (Essence of). This is liquid burnt sugar or spirit colouring. *Used* to make extemporaneous toast-and-water (3 or 4 drops to the glass), and to flavour soups, gravies, &c.

TOBACCO. *Syn.* TABACUM (Ph. L. E. & D.), L.; TABAC, Fr. The prepared leaf of *Nicotiana Tabacum* (Linn.), or other species of the same genus. The name was given to this herb by the Spaniards, because it was first seen by them at Tabasco, or Tabaco, a province of Yucatan, in Mexico.

The tobacco of commerce is chiefly obtained from Virginia, and other parts of the United States, and recently from Japan and California, but the finest varieties are imported from Havannah and from the East. The plants are gathered when mature, during hot dry weather, and are hung up in pairs, in sheds, to dry. When sufficiently dry, the leaves are separated from the stems, bound up in bundles, and these are formed into bales, or packed in hog-heads, for exportation.

Prep. To impart to the dried leaves the characteristic odour and flavour of tobacco, and to render them agreeable to smokers and snuffers, it is necessary that they should undergo a certain preparation, or kind of fermentation. If a fresh green leaf of tobacco be crushed between the fingers, it emits merely the herbaceous smell common to most plants; but if it be triturated in a mortar along with a very small quantity of quicklime or caustic alkali, it will immediately exhale the peculiar odour of manufactured tobacco. This arises from the active and volatile ingredients being liberated from their previous combination, by the ammonia developed by fermentation, or the action of a stronger base. Tobacco contains a considerable quantity of chloride of ammonium, and this substance, as is well known, when placed in contact with lime or potassa, immediately evolves free ammonia. If we reverse the case, and saturate the excess of alkali in prepared tobacco by the addition of any mild acid, its characteristic odour entirely disappears. In the preparation of tobacco previously to its manufacture for sale, these changes are effected by a species of fermentation. Pure water, without any addition, is quite sufficient to promote and maintain the perfect fermentation of tobacco. The leaves soon become hot and evolve ammonia; during this time the heaps require to be occasionally opened up and turned over, lest they become too hot, take fire, or run into the putrefactive fermentation. The extent to which the process is allowed to proceed varies, for different kinds of snuff or tobacco, from one to three months.

Qual., &c. Tobacco is a powerful narcotic, sedative, and emetic; and is also cathartic and diuretic; but the last in a weaker degree than either squills or foxglove. Its action is violently depressing and relaxing, producing fainting, and even death, in comparatively small quantities. Toxicologists rank it among the more active narcotico-acrid poisons; and physicians, when they wish to produce sudden physical prostration, in accidents or spasmodic diseases, order an enema of the infusion or smoke of tobacco. Its deleterious properties depend on the presence of narcotine, one of the most frightful vegetable poisons known, of which ordinary Virginia tobacco contains from 6 to 7½%. Yet of such a vegetable substance, so rich in such a deadly poison, upwards of 30,000,000 lbs. are said to be annually consumed in the British islands alone, by smokers and snuffers.

Tobacco, British. *Syn.* HERB TOBACCO; TABACUM ANGLICUM, SPECIES STRENUOSIOR, L. *Prep.* Take of thyme, marjoram, and hyssop, of each, 2 oz.; betony and eyebright, 3 oz.; rosemary and lavender, of each, 4 oz.; coltsfoot, 1 lb.; mix, press them together, and cut the mass in imitation of manufactured foreign tobacco. Some asthmatic subjects add 5 or 6 oz. of stramonium or thorn-apple

leaves; and others add $\frac{1}{2}$ lb. of genuine tobacco.

Tobacco, Indian. See LOBELIA.

TOD'DY. Obtained from various species of palms, by cutting off the end of the flowering bud, and collecting the sap. *Used*, fresh, as a cooling beverage; and, after fermentation, as an intoxicating one. Sweetened grog is so called in Cornwall, and in some other parts of England.

TOFF'Y. *Syn.* EVERTON TOFFY. A sweet-meat prepared by heating brown sugar, in a saucepan or skillet, with about one half its weight of fresh butter, for 15 to 20 minutes, or until a 'little of it dropped into cold water forms a lump that breaks crisply;' it is then poured into a little buttered tin mould.

TOMBAC. A species of brass with excess of zinc. Red tombac is red brass or Dutch gold; white tombac, an alloy of copper with arsenic.

TONICS. Medicines that increase the tone of the muscular fibre, and impart vigour to the system.

TONQUIN REMEDY. *Syn.* PULVIS TRUNCHINENSIS, P. ALEXIPHARMICUS SINENSIS, L. *Prep.* From valerian, 20 grs.; musk, 16 grs.; camphor, 6 grs.; mix. Antispasmodic and alexiterial, in doses of 6 to 12 grs., in hooping-cough, &c.; 1 dr., in hydrophobia, exanthemata, and mania.

TOOTH'ACHE. *Syn.* ODONTALGIA, L. This annoying affection frequently arises from sympathy with a disordered stomach. In such cases a saline purgative should be administered, and an emetic, if required. When cold is the cause, an excellent remedy is a hot embrocation of poppy-heads, followed by the use of flannel and diaphoretics. When it arises from a hollow or decayed tooth, the best application is a piece of lint moistened with creasote, or a strong spirituous solution of creasote, and closely rammed into the cavity of the tooth. Laudanum, the essential oils of cloves, caraway, and cajuput, and essence or tincture of pellitory of Spain, are also used in the same way. To prevent the recurrence of the latter kind of toothache, the cavity should be filled with an amalgam of gold, or with mineral marmorum, or some other good cement. In many cases, chewing a piece of good ginger, or, still better, a small piece of pellitory, will afford relief in a few minutes. The celebrated John Wesley recommended a 'few whiffs' at a pipe containing a little caraway seed mixed with the tobacco. A slight 'shock' from a voltaic battery will often instantly remove the toothache after all other means have failed. See DROPS, ESSENCE, TINCTURE, &c.

TOOTH CEMENTS. *Prep.* 1. Amalgam of gold, applied warm. Silver, and even tin, are also used in the same way.

2. A piece of purified white gutta percha, softened in hot water, and applied at once. Efficient and durable.

3. Zinc filings, 1 part; quicksilver, 2 parts;

mixed, and applied at once. Not very durable.

4. (Bernotte's.) From powdered mastic mixed with about half its weight of ether, and, afterwards, with enough finely powdered burnt alum to form a stiff paste. 'Taveare's Cement' is similar.

5. (Evans.) Pure tin, 2 parts; cadmium and bees' wax, of each, 1 part; melt them together, cast the compound metal into a small ingot, and reduce it to filings. For use, form these into a liquid amalgam with quicksilver, q. s.; squeeze out the excess of quicksilver through a piece of chamois leather, and at once apply it to the tooth. (See No. 9.) Recommended as very durable and unobjectionable.

6. ('MARMORATUM.') From anhydrous phosphoric acid, 12 grs.; pure caustic lime, 13 grs.; both finely pulverised, mixed rapidly in a mortar, and applied, in the dry state, as rapidly as possible, as it soon becomes moist; the mixed powder, after being well pressed in, is smoothed off with the finger moistened with a drop of water. This is white and durable, and soon acquires great hardness. In its composition it resembles the natural earthy matter of the teeth.

7. ('MINERAL MARMORATUM.') The same as 'mineral succedaneum' (No. 9), with the addition of a little powdered glass or quartz. A common sort is made of levigated glass, mixed with amalgam of tin.

8. ('MINERAL METALLIC CEMENT.') Add finely levigated steel filings to some mineral succedaneum. Dark-coloured inferior to 'mineral marmoratum.'

9. ('MINERAL SUCCEDANEUM.') This is merely amalgam of gold first above noticed. The common method of proceeding is to heat pure gold in a bright iron ladle, and to add enough pure mercury to render it of a doughy consistence at the heat of hot water; when cold, the excess of mercury, if any, must be removed by pressure in a piece of chamois leather. For use, a little must be kneaded, as hot as possible, in the hand, and at once wedged into the cavity of the tooth.

10. (Ostermaier's.) Same as No. 6.

11. ('POUDRE METALLIQUE.') The article sold in Paris under this name is said to be a triple amalgam of mercury, silver, and ammonium, with the latter in excess; part of the ammonium escapes as ammoniacal gas, whilst the remainder of the ammonium, silver, and mercury, remains as a firm alloy in the cavity of the tooth. (Redwood.)

12. ('SILICA.') From levigated porcelain, plaster of Paris, and iron filings, equal parts, made into a paste with the thickest quick-drying copal varnish.

13. ('VIENNA CEMENT.') From powdered asbestos, made into a paste with mastic varnish.

14. (Wirth's.) From levigated quartz, made into a paste with very thick mastic varnish.

Obs. It is absolutely necessary for success that the teeth be well cleaned out, and wiped dry, before applying any of the above stoppings or cements.

TO'PAZ. See GEMS.

TOR'MENTIL. *Syn.* TORMENTILLÆ RADIX; TORMENTILLA (Ph. L. & E.), L. The root or rhizome of *Potentilla Tormentilla*. It is astringent and febrifuge, without being stimulant.—*Dose.* 20 to 60 grs.; in agues, diarrhoea, &c.; also, formerly, in syphilis.

TOUCH-NEEDLES. See ASSAYING.

TOUCH-WOOD. See AMADOU.

TOUS-LES-MOIS. The fecula of the roots of *Canna edulis* (Ph. D.); intended as a substitute for arrow-root. To the naked eye, it closely resembles the finest quality of potato-starch, but under the microscope its granules are found to be oblong, oval, with a concentric structure, and larger than those of the potato tuber.

TOXICOL'OGY. See POISON.

TRAG'ACANTH. See GUM.

TRANSPA'RENCIES. Water-colour pictures on paper, linen, or calico, if executed in non-opaque or glazing colours, may be converted into transparencies by simply brushing over their backs with Canada balsam, thinned down, when necessary, with a little oil of turpentine. For coarse work, boiled oil may be employed.

TRAUMATIC BALSAM. Compound tincture of benzoin is known by this name. See TINCTURE.

TRAUMATICINE. This article, as manufactured by the Gutta Percha Company, is simply a solution of white and dry unmanufactured gutta percha in bisulphuret of carbon. A small portion dropped on a wound, or raw surface, almost instantly forms a pliable, waterproof, and air-tight defensive covering to the part. The only objection to the preparation is the fetid odour of the menstruum, which, however, is lost in a few seconds, or may be obviated by employing chloroform as the solvent.

TREA'GLE. *Syn.* MOLASSES; THERIACA (B. P.), THERIACA, SACCHARI FEX (Ph. L. & E.), L. The viscid, brown, uncrystallisable syrup which drains from moist sugar during its formation (molasses), and from the sugar-refining moulds (sugar-house molasses). The last, according to Dr. Ure, has generally the sp. gr. 1.4, and contains about 75% of solid matter.

Treacle is more laxative than sugar, and always contains more or less free acid. It is used as the vehiculum in some of the pill-masses of the Ph. L. See SUGAR.

Treacle, German. *Syn.* THERIACA GERMANICÆ, L. An evaporated infusion or decoction of juniper berries. It is sweet-tasted, aromatic, and diuretic.

Treacle, Venice. *Syn.* LONDON TREACLE; THERIACA, T. ANDROCHI, L. The theriaca of the Ph. L. 1746 consists of 61 ingredients,

and contains 1 gr. of opium in 75 grs.; that of the Paris Codex consists of 72 ingredients, and contains 1 gr. of opium in 72 grs.; that of the Ph. E. 1744 consists of 10 ingredients, and contains 1 gr. of opium in every 100 grs. It is prepared as follows:—Take of serpentary root, 6 oz.; valerian and contrayerva roots, of each, 4 oz.; aromatic powder, 3 oz.; guaiacum resin, castor, and nutmeg, of each, 2 oz.; saffron and opium (dissolved in a little wine), of each, 1 oz.; clarified honey, 75 oz.; reduce all the dry ingredients to fine powder, then mix them. The confections or electuaries of catechu and opium are the representatives of the above polypharmic compounds in the modern British Pharmacopœias.

TRI-, TRIS-. See NOMENCLATURE.

TRIP'OLI. *Syn.* ROTTEN STONE; ALANA, TERRA CARIOSA, L. A mineral employed as a polishing powder, originally imported from Tripoli, in Barbary. It consists almost entirely of silica, and is composed of the skeletons of minute infusoria, the precise character of which is readily distinguishable under the microscope.

TRIS'MUS. See TETANUS.

TRITUR'ATION. *Syn.* TRITURA, TRITURATIO, L. The act of rubbing a solid body to powder. See PULVERIZATION.

TRO'CHES. See LOZENGES.

TRO'NA. A native carbonate of soda, found on the banks of the soda-lakes of Sokena, in Africa.

TROPH'AZOME. A concentrated infusion of minced lean meat mixed with the fluid obtained from the residuum after being heated for 20 minutes in a water bath, and flavoured with salt and spices, the whole being, lastly, simmered for a few minutes. Excellent for convalescents.

TROUT. The *Salmo furio* of Linnæus, a highly esteemed fish, found in most of the rivers and lakes of this country. Other members of the genus *salmo* are also so called; as, *S. eriox*, the bull or gray trout; *S. ferox*, the great gray or lake trout; *S. trutta*, the salmon trout, &c. All of these varieties are in the finest condition from the end of May to late in September.

TUNG'STEN. W. *Syn.* TUNGSTENUM, WOLFRAMITUM, L. A heavy, gray, brittle metal, discovered by Delhuysen.

TUNGSTATE OF SODIUM. Na₂WO₄. This salt is used for rendering linen, cotton, and other fabrics uninflamable; also as a substitute for stannate of sodium as a mordant in dyeing. It may be prepared by adding 9 parts of finely powdered tungsten to 8 parts of fused carbonate of sodium, and continuing the heat for some time; on boiling the cooled and pulverised mass with water, evaporating the filtrate to dryness, and treating the residue with luke-warm water, the salt dissolves out. Muslin steeped in a 20% solution of this salt is perfectly uninflamable when dry, and the saline film left upon its surface is so smooth that the

muslin may be ironed without difficulty. See Richardson and Watt's 'Chemical Technology,' i, [4] 48.

TURBOT. The *Rhombus maximus* (Cuvier), said to be the best and, excepting the halibut, the largest of our flat fishes. Dutch turbot is the most esteemed.

TURKEY. See POULTRY.

TURMERIC. *Syn.* CURCUMA (Ph. L. & D.), L. The rhizome of *Curcuma longa*. The best is imported from Ceylon. It is stimulant and carminative, but is chiefly used in dyeing yellow, and as an ingredient in curry-powder; also as a test for alkalies. It gives a fugitive golden yellow with woad, and an orange tinge to scarlet. It dyes wool and silk, mordanted with common salt, or sal ammoniac, a fugitive yellow.—*Dose.* 10 to 30 grs. See CURCUMINE.

TURNBULL'S BLUE. *Syn.* FERRICYANIDE OF IRON; FERRI FERRIDICYANIDUM, L. *Prep.* Precipitate a solution of protosulphate of iron with another of red prussiate of potash (ferricyanide of potassium).

Obs. This is a variety of Prussian blue, remarkable for its beautiful colour, and may be distinguished from the ordinary Prussian blue of commerce by its action on the yellow prussiate of potash. When boiled in a solution of the latter, it is decomposed, a portion is dissolved, and a gray residue remains.

TURNER'S YELLOW. See YELLOW PIGMENTS.

TURNU'SOLE. See LITMUS.

TURPENTINE. *Syn.* TURPENTIN; TERE-BINTHINA (Ph. L. E. D.), L. An oleo-resin flowing from the trunk, the bark being removed, of *Pinus palustris* (pitch or swamp pine) and *Pinus Teda* (loblolly or old field pine). (Ph. L.) "From *Pinus sylvestris* (the Scotch fir)." (Ph. D.) "From various species of *Pinus* and of *Abies*." (Ph. E.) It is viscid, of the consistence of honey, and transparent; by distillation it is resolved into oil of turpentine, which passes over into the receiver; and into resin, which remains in the still.

Turpentine, Bordeaux. *Syn.* FRENCH TURPENTINE. From the *Pinus maritima*, or cluster pine. Solidifies with magnesia. (Lindley.)

Turpentine, Chian. *Syn.* CHIO TURPENTINE, CYPRUST, SCIO T.; TERE-BINTHINA CHIA (Ph. L. & E.), L. "An oleo-resin flowing from the incised trunk of *Pistachia terebinthos*." (Linn.) (Ph. L.) It is pale, aromatic, fragrant, and has a warm taste, devoid of acrimony or bitterness. It is much adulterated. A factitious article (terebinthina Chia factitia), made as follows, is also very generally sold for it:—Black resin, 7 lbs.; melt, remove the heat, and stir in of balsam of Canada, 7 lbs.; oils of fennel and juniper, of each, 1 fl. dr.

Turpentine, Venice. *Syn.* TERE-BINTHINA VENETA (Ph. E.), L. Liquid resinous exudation from the *Abies Larix*, or larch tree. It is sweeter and less resinous-tasted than common

turpentine, but is now scarcely ever met with in trade. That of the shops is wholly a factitious article, made as follows:—Black resin, 48 lbs.; melt, remove the heat, and add of oil of turpentine, 2 galls.

TURPETH MINERAL. Basic sulphate of mercury.

TURTLE. *Syn.* GREEN TURTLE. The *Testuda midas* (Linn.), a chelonian reptile, highly esteemed for its flesh, eggs, and fat.

TUSSILA'GO. See COLTSFOOT.

TUTENAG. A name sometimes applied to German silver; at others, to pale brass and bell metal. "In India zinc sometimes goes under this name." (Brande.)

TUTTY. *Syn.* TUTIA, TUTHIA, IMPURE OXIDE OF ZINC. The sublimate that collects in the chimneys of the furnaces in which the ores of zinc are smelting. Drying; astringent. Used in eye-waters and ointments.

TYPE METAL. An alloy formed of antimony, 1 part; lead, 8 parts; melted together. Small types are usually made of a harder composition than large ones. A good stereotype metal is said to be made of lead, 9 parts; antimony, 2 parts; bismuth, 1 part. This alloy expands as it cools, and, consequently, brings out a fine impression.

ULMIN, ULMIC ACID. By boiling sugar in dilute sulphuric acid for a long time, a brownish-black substance is produced. Boullay and Malaguti state that this is a mixture of two distinct bodies—ulmin (sacchulin—Liebig) and ulmic acid (sacchulmic acid—Liebig). The first is insoluble in solutions of the alkalies; the latter dissolves in them freely. A number of black uncrystallisable substances, produced by the action of powerful chemical agents upon vegetable matter, have been confounded under these names.

ULTRAMARINE. *Syn.* LAPIS-LAZULI BLUE, ULTRAMARINE B.; CÆRULEUM ULTRAMONTANUM, L. This beautiful pigment is obtained from the blue mineral azure stone, lazulite, or lapis lazuli, the finest specimens of which are brought from China, Persia, and Great Bucharina.

Prep. Pure lapis lazuli (reduced to fragments about the size of a pea, and the colourless pieces rejected), 1 lb., is heated to redness, quenched in water, and ground to an impalpable powder; to this is added, of yellow resin, 6 oz.; turpentine, bees' wax, and linseed oil, of each, 2 oz.; previously melted together; the whole is next made into a mass, which is kneaded in successive portions of warm water, as long as it colours it blue; from these it is deposited on repose, and is then collected, well washed with clean water, dried, and sorted according to its qualities. The first water, which is usually dirty, is thrown away; the second gives a blue of the first quality; and the third, and following ones, yield samples of less value. The process is founded on the property which the colouring matter of

azure-stone has of adhering less firmly to the resinous cement than the foreign matter with which it is associated. When azure-stone has its colour altered by a moderate heat, it is reckoned bad or factitious.

Obs. Ultramarine is the most costly, but at the same time the most splendid and permanent, of our blue pigments, and works well in oil.

Ultramarine Ashes. *Syn.* SAUNDER'S BLUE. Obtained from the resinous mass from making ultramarine, by melting it with fresh oil, and kneading it in water containing a little potash or soda; or, by burning away the wax and oil of the mass and well grinding and washing the residue with water. Very permanent, but much less brilliant than ultramarine.

Ultramarine, Artificial. *Syn.* AZURE BLUE, MEISSNER ULTRAMARINE, PARIS B., VIENNA B.; CÆRULEUM ULTRAMONTANUM FACTITIUM, L. From the researches of Clement, Desormes, and Robiquet, it has been inferred that the colour of ultramarine depends on the presence of sulphuret of sodium in a peculiar state of combination with the silicates of soda and alumina; but, according to Elsner and Tirnmon, a minute quantity of sulphuret of iron is also an essential ingredient. It is by heating mixtures of this kind that the artificial ultramarine of commerce is prepared. The finer specimens, thus obtained, are quite equal in durability and beauty of colour to those prepared from lazulite, while they are very much less expensive.

Prep. 1. Kaolin, 37 parts; sulphate of soda, 15; carbonate of soda, 22; sulphur, 18; charcoal, 8; intimately mixed and heated from 24 to 30 hours, in large crucibles; the product is then heated again in cast-iron boxes, at a moderate temperature, till the required tint is obtained; it is, finally, pulverised, washed, and dried.

2. (Gmelin.) Sulphur, 2 parts; dry carbonate of soda, 1 part; mix well; gradually heat them in a covered crucible to redness, or till the mixture fuses, then sprinkle in, by degrees, another mixture of silicate of soda and 'aluminate of soda' (containing 72 parts of silica and 70 parts of alumina), and continue the heat for an hour. The product contains a little free sulphur, which may be separated by water.

3. (Robiquet.) By exposing to a low red heat, in a covered crucible, as long as fumes are given off, a mixture of pure kaolin, 2 parts; anhydrous carbonate of soda and sulphur, of each, 3 parts. Some manufacturers who adopt this process use 1-3rd less carbonate of soda.

4. (Tirnmon.) Take of crystallised carbonate of soda, 1075 grs.; apply a gentle heat, and, when fused in its water of crystallisation, shake in of finely pulverised orpiment, 5 grs., and, when partly decomposed, add as much gelatinous hydrate of alumina as contains 7 grs. of anhydrous alumina; finely sifted clay, 100 grs., and flowers of sulphur, 221 grs., are next to be added, and the whole placed in a covered

crucible, and at first gently heated, to drive off the water; but as soon as this is effected, raised to redness, the heat being so regulated that the ingredients only 'sinter' together, without actually fusing; the mass is then to be cooled, finely pulverised, suspended in river water, and brought upon a filter; the product has now a very beautiful delicate green or bluish colour, but on being heated in a covered dish, and stirred about from time to time, until the temperature reaches that of dull redness, at which it must be kept for 1 or 2 hours, it changes to a rich blue. If the heat of the first calcination has been properly regulated, the whole of the mass taken from the crucible will have uniform colour; but if too little heat has been used, and the ingredients have not been properly mixed, there will be colourless parts, which should be rejected; if too much heat has been used, or the mass allowed to fuse, brown parts will appear, especially if the crucible is of a bad kind, or easily destroyed; these must also be rejected. ('Compt. Rend.' 1842.)

Ultramarine, Cobaltic. *Syn.* CHINESE BLUE, COBALT B., LOUISA B., HÖFFNER'S B., THÉNARD'S B. A very rich blue pigment, with many synonyms, prepared by slowly drying and heating the dull redness a mixture of freshly precipitated alumina (freed from water as much as possible), 8 to 10 parts; arseniate or phosphate of cobalt, 1 part. By daylight it is of a pure blue, but by artificial light the colour turns on the violet. For other formulæ see BLUE PIGMENTS.

UPAS. The Javan name for several deadly poisons. 'Bohun upas' is a gum-resin obtained from the bark of the *Antiaris toxicaria*. (See ANTIARINE.) The 'upas tieuté' is obtained from the *Strychnos Tieuté*, and owes its fatal power to strychnine. They are both used to poison arrows and other deadly weapons.

URA'NIUM. U. A rare metal, discovered by Klaproth, in 1789. It occurs in the pitchblende of Saxony, and the uranite of Cornwall.

Uses. Its ores and oxides are occasionally used to colour glass and enamels.

U'RATES. Salts of uric acid.

U'REA. COH₂N₂. *Syn.* CYANATE OF AMMONIUM (Anomalous). A crystalline, colourless, transparent substance, discovered by Fourcroy and Vauquelin in Urine, and by Wöhler as the first organic compound artificially produced.

Prep. (Thénard.) Fresh urine, gently evaporated to the consistence of a syrup, is treated with its own volume of nitric acid of sp. gr. 1.19; the mixture is shaken and immersed in an ice bath, to solidify the crystals of nitrate of urea; these are washed with ice-cold water, drained, and pressed between sheets of blotting paper; they are next dissolved in water, and the solution is decomposed and precipitated with carbonate of potassium (or carbonate of barium); the whole is then gently evaporated nearly to dryness, and the residuum is exhausted with pure alcohol, which dissolves

the urea, which crystallises out as the solution cools.

Urea, Nitrate of. *Syn.* UREA NITRAS, L. *Prep.* From urine, as described above; or it may be prepared by saturating artificial urea with nitric acid. Diuretic.—*Dose.* 2 to 5 grs., twice or thrice daily; in dropsy.

URIC ACID. $C_5H_4N_4O_6$. *Syn.* LITHIC ACID; ACIDUM LITHICUM, A. URICUM, L. A substance discovered by Scheele, and peculiar to the urine of certain animals, and the excrement of serpents and several birds. The faces of the hexa constrictor consist of little else than urate of ammonium. It constitutes one of the commonest varieties of urinary calculi, and of the red gravel or sand which is voided in certain morbid states of the urine. Guano derives its principal value as a manure from the presence of urate of ammonium. The gouty concretions of the joints, popularly known as chalk-stones, consist chiefly of urate of sodium.

Prep. Dissolve the chalk-like excrement of serpents, reduced to fine powder, in a solution of caustic potassa, by boiling, then add hydrochloric acid in excess, again boil for 15 minutes, and well wash the precipitate with water.

Prop., &c. Brilliant, very minute, white and silky scales, which are tasteless, inodorous, slightly soluble in boiling water, and dissolve in strong sulphuric acid, but are again precipitated by water. It forms salts with the bases called urates, all of which are very sparingly soluble. The characteristic reaction of uric acid is, that, when moistened with nitric acid and heated, it dissolves, and by evaporation yields a red compound, which, upon the addition of a drop or two of solution of ammonia, assumes a magnificent crimson colour, being converted into murexide.

URINE. The density of the urine varies from 1.005 to 1.030; the average, in health, being 1.020, when it contains about 380 grs. of solid matter in the pint. According to Berzelius, the proportion is about $6\frac{1}{2}\%$, the rest being pure water. It exhibits a decidedly acid reaction, and is never alkaline, except during disease, or the use of large quantities of alkaline salts of the vegetable acids. The average quantity secreted during 24 hours may be taken at $1\frac{1}{2}$ pint to $1\frac{3}{4}$ pint.

The presence of bile in urine, or other like fluids, may be detected as follows?—Put a small quantity of the suspected liquid into a test-tube, and add to it drop by drop, strong sulphuric acid, until it becomes warm, taking care not to raise the temperature above 122° Fahr.; then add from 2 to 5 drops of syrup (made with 5 parts of sugar to 4 of water), and shake the mixture. If the liquid contain bile, a violet coloration is observed. Acetic acid may be substituted for sugar.

The presence of sugar, and the quantity present, may be determined in the manner described under SUGAR (tests for). White merino,

that has been wet with a solution of bichloride of tin, is also said to form a ready test for sugar in urine.

The quantity of urea present in urine is best determined by treating that liquid with a solution of permanganate of mercury of known strength, alternately with a solution of baryta, as long as a white precipitate falls. As soon as the whole of the urea is thrown down, the precipitate assumes a yellow colour.

URINOMETER. An hydrometer adapted to determining the density of urine. That of Dr. Prout is the simplest and best.

URN POWDER. Crocus martis, or jeweller's rouge.

URTICARIA. See RASH.

USQUEBAUGH. *Syn.* ESQUEBAC. Literally, mad water, the Irish name of which, 'whiskey,' is a corruption. At the present time it is applied to a strong cordial spirit, much drunk in Ireland, and made in the greatest perfection at Drogheda.

Prep. 1. Brandy or proof spirit, 3 galls.; dates (without their kernels) and raisins, of each, bruised, $\frac{1}{2}$ lb.; juniper berries, bruised, 1 oz.; mace and cloves, of each, $\frac{3}{4}$ oz.; coriander and aniseed, of each, $\frac{1}{2}$ oz.; cinnamon, $\frac{1}{2}$ oz.; macerate, with frequent agitation, for 14 days, then filter, and add of capillaire or simple syrup, 1 gall.

2. Pimento and caraways, of each, 3 oz.; mace, cloves, and nutmegs, of each, 2 oz.; aniseed, corianders, and angelica root, of each, 8 oz.; raisins, stoned and bruised, 14 lbs.; proof spirit, 9 galls.; digest as before, then press, filter, or clarify, and add of simple syrup, q. s. Should it turn milky, add a little strong spirit, or clarify it with alum, or filter through magnesia.

Obs. Usquebaugh is either coloured yellow with saffron (about $\frac{1}{2}$ oz. per gall.), or green with sap-green (about $\frac{1}{2}$ oz. per gall.); either being added to the other ingredients, before maceration in the spirit.

VACCINATION. See COW-POX.

VACCINE MATTER. *Syn.* LYMPHA VACCINÆ, L. This is collected either upon the points of lancet-like pieces of ivory, or by opening the pustule, and applying a small glass ball and tube (like those called by the boys in London candle-pops, or fire-pops) to the orifice, expelling part of the air in the ball by bringing a lighted taper near it; then, withdrawing the taper, the matter is sucked into the ball, in which it may be sealed up hermetically or cemented, and thus kept for a length of time. It is, however, now generally preserved between two small pieces of glass, or in straight capillary glass tubes. It is said that cotton thread is a convenient and efficient vehicle. The matter may be liquefied with a little clean water before application. A degree of heat scarcely higher than that of the blood lessens its efficacy.

VACUUM. Empty space; a portion of

space void of matter. For experimental and manufacturing purposes, a sufficient vacuum is produced either by means of the air-pump, or by filling an enclosed space by steam, which is then condensed by the application of cold. Evaporation proceeds much more rapidly, and liquids boil at much lower temperatures in an exhausted receiver than when exposed to the air. Thus, under ordinary circumstances, in the air, ether boils at 96°, alcohol at 177°, and water at 212° Fahr.; but in vacuo water boils at about 88°, alcohol at 56°, and ether at -20° Fahr. In the best vacuum obtainable by a powerful air-pump, water placed over oil of vitriol, to absorb the aqueous vapour as it forms, will often enter into violent ebullition whilst ice is in the act of formation on its surface. The reduction of the boiling-point with reduced pressure is practically taken advantage of by the pharmacist in the preparation of extracts, by the sugar refiner in the evaporation of his syrups, by the distiller in the production of certain liquors, and by the chemist in a variety of processes of interest or utility. See EXTRACTS, EVAPORATION, REFRIGERATION, &c.

VALE'RIAN. *Syn.* VALERIANÆ RADIX (B. P.), VALERIANÆ RADIX, VALERIANA (Ph. L. E. & D.), L. "The root of the wild plant *Valeriana officinalis* (Linn.), or wild valerian." (Ph. L.) An excitant, antispasmodic, tonic, and emmenagogue, not only acting on the secretions, but exercising a specific influence over the cerebro-spinal system, and in large quantities producing agitation, mental exaltation, and even intoxication.—*Dose.* 10 to 30 or 40 grs., thrice daily; in hysteria, epilepsy, headache (affecting only one side), morbid nervous sensibility, &c. Even the odour of it exerts a species of fascination over cats.

VALERIAN'IC ACID. $\text{HC}_8\text{H}_9\text{O}_5$. *Syn.* VALERIANIC ACID; ACIDUM VALERIANICUM, A. VALERIANICUM, L. *Prep.* 1. A mixture of potato oil or corn-spirit oil (hydrated oxide of amyl) with about 10 times its weight of quicklime and hydrate of potassa in equal proportions, placed in a glass flask, is kept heated to about 400° Fahr., for 10 or 12 hours, by means of a bath of oil or fusible metal; the nearly white solid residuum is mixed with water, an excess of sulphuric acid added to the mixture, and the whole subjected to distillation; the distillate is supersaturated with potassa, evaporated nearly to dryness, to dissipate any undecomposed potato oil, and then mixed with weak sulphuric acid in excess; a light oily liquid (terhydrated valerianic acid) separates, which, by cautious rectification, yields at first water containing a little acid, and afterwards pure monohydrated valerianic acid, which is perfectly identical with that prepared from valerian root.

2. (Ph. D.) See VALERIANATE OF SODIUM. This is the most economical process.

Prop., &c. A limpid oily liquid, smelling strongly of valerian root; it has an acid taste and reaction, and leaves a sensation of sweet-

ness and a white spot on the tongue; is inflammable; boils at 347°; is freely soluble in alcohol and ether; dissolves in 30 parts of water, and forms salts called valerianates, most of which have a sweetish taste, are soluble, and uncrystallisable; sp. gr. .937; placed in contact with water, it absorbs a portion of it, and is converted into the terhydrated acid, with increase of sp. gr., and reduction of the boiling-point.

VALE'RIC ACID. See VALERIANIC ACID.

VALO'NIA. The cup of a large species of acorn, imported from the Levant. Used in tanning leather.

VANAD'IC ACID. V_2O_5 . *Syn.* VANADIC ANHYDRIDE, TEROXIDE OF V.; ACIDUM VANADICUM, L. *Prep.* (Johnston.) From the native vanadate of lead, by dissolving it in nitric acid, passing sulphuretted hydrogen through the solution, to throw down lead and arsenic, filtering, and evaporating the resulting blue liquid to dryness; the residuum is then dissolved in a solution of ammonia, and a piece of sal ammoniac, considerably larger than can be dissolved, introduced; as the latter dissolves, a pulverulent precipitate of vanadate of ammonium is formed, which must be washed, first in a solution of sal ammoniac, and then in alcohol of 860; by exposing this salt, in an open platinum crucible, to a heat a little below redness, and keeping it constantly stirred, until it acquires a dark red colour, pure vanadic acid is obtained.

Prop., &c. Vanadic acid is orange-coloured, scarcely soluble in water, and forms, with the alkaline bases, soluble salts called vanadates; and with the other bases sparingly soluble salts. All of these have an orange or yellow colour. "Vanadate of ammonia mixed with solution of galls forms a black fluid, which is the best writing ink hitherto known. The quantity of the salt required for this purpose is very small; the writing is perfectly black, and not obliterated by alkalis, acids, chlorine, or other reagents." (Ure.)

VANA'DIUM. V. A rare metal discovered by Sefstom, in 1830, in some Swedish iron extracted from an iron mine near Jönköping. It has since been found in a lead ore from Scotland, and in the iron slag of Staffordshire.

VANIL'LA. *Syn.* VANILLE, Fr. The dried pods of various species of Vanilla, a genus of the natural order *Orchidaceæ*. It is chiefly used in the manufacture of chocolate and perfumery. As a medicine, it is much employed on the Continent as an aromatic stimulant and neurotic.—*Dose.* 6 to 12 grs.; in asthenic fevers, hysteria, hypochondriasis, impotency, &c.

Vanilla is reduced to powder (PULVIS VANILLE; POUDRE DE VANILLE) by slicing it, and triturating the fragments with twice or thrice their weight of well-dried lump sugar. For SUCRE DE VANILLE, 11 parts of sugar are employed.

must then be well agitated for 5 minutes, and afterwards allowed to settle.

Varnish, Oak. *Syn.* WAINSCOT VARNISH, COMMON TURPENTINE V. *Prep.* 1. Clear pale resin, 3½ lbs.; oil of turpentine, 1 gal.; dissolve.

2. To the last add of Canada balsam, 1 pint. Both are cheap and excellent common varnishes for wood or metal.

Varnish, Oil. The finer qualities are noticed under AMBER, BODY, CARRIAGE, and COPAL VARNISH; the following produces the ordinary oil varnish of the shops:—Take of good clear resin, 3 lbs.; drying oil, ½ gal.; melt, and thin with oil of turpentine, 2 quarts. A good and durable varnish for common work.

Varnish, Painter's. See CARRIAGE, COPAL, MAHOGANY, OAK, OIL, and other varnishes. The selection depending greatly on the colour and quality of the work.

Varnish, Patent Leather. This is carefully prepared drying oil. The skins being stretched on a board, and every trace of grease being removed from them by means of a mixture of fuller's earth and water, they are ready to receive the varnish, which is then spread upon them, very thinly, by means of a species of scraper. The first coat varnish consists of pale Prussian blue (that containing some alumina), 5 oz.; drying oil, 1 gal.; boiled to the consistence of single size, and, when cold, ground with a little vegetable black; it is stove, and afterwards polished with fine-grained pumice;—the second coating resembles the first; excepting in having a little pure Prussian blue mixed with it;—the third coat varnish consists of a similar mixture, but the oil is boiled until it strings well, and a little mere pure Prussian blue and vegetable black are added;—the last coat varnish, or finish, is the same as the third, but must contain ½ lb. of pure dark-coloured Prussian blue, and ¼ lb. of pure vegetable black per gal., to which a little oil copal or amber varnish is often added; each coat being duly stove and pumiced before the next is applied. The heat of the stove or oven is commonly 120° Fahr. for 'enamelled skins,' as those of the calf and seal, intended for 'uppers,' and 175° to 180° for stout 'Japan leather;' the exposure in the stove is commonly for 6 to 10 hours. The skins are next oiled and grained. The 'graining' of the 'enamelled skins' is done by holding the skin in one hand, and with a curved board lined with cork (graining stick), lightly pressed upon the fleshy side, working it up and down until the proper effect is produced.

Varnish, Picture. Several varnishes, especially mastic varnish, are called by this name. Pale copal or mastic varnish is generally used for oil paintings, and crystal, white hard spirit, or mastic varnish, for water-colour drawings on paper.

Varnish, Printer's. Diluted with twice its volume of oil of turpentine, it forms a good common varnish.

Varnish, Sealing-wax. Black, red, or any coloured sealing-wax, broken small, with enough rectified spirit (or methylated spirit) to cover it, digested till dissolved. A most useful varnish for wood-work of electrical or chemical apparatus, for tops of corks, &c.

Varnish, Spirit. *Prep.* 1. (BROWN HARD.)—*a.* From gum sandarach, 3 lbs.; pale seed-lac or shell lac, 2 lbs.; rectified spirit (65 o. p.), 2 galls.; dissolve, and add of turpentine varnish, 1 quart; agitate well, strain (quickly) through gauze, and in a month decant the clear portion from the sediment. Very fine.

b. From seed-lac and yellow resin, of each, 1½ lb.; rectified spirit, 5 quarts; oil of turpentine, 1½ pint; dissolve. Inferior to the last.

2. (WHITE HARD.)—*a.* From gum sandarach (picked), 5 lbs.; camphor, 2 oz.; washed and dried coarsely pounded glass, 3 lbs.; rectified spirit (65 o. p.), 7 quarts; proceed as in making mastic varnish; when strained, add of pure Canada balsam, 1 quart. Very pale, durable, and brilliant.

b. From gum sandarach and gum mastic, of each, picked, 4 oz.; coarsely powdered glass, 8 oz.; rectified spirit, 1 quart; dissolve, and add of pure Strasburg turpentine, 3 oz. Very fine.

3. (SOFT BRILLIANT.) From sandarach, 6 oz.; elemi (genuine), 4 oz.; anisé, 1 oz.; camphor, ½ oz.; rectified spirit, 1 quart; as before.

4. (SCENTED.) To the preceding add some gum benzoin, balsam of Peru, balsam of Tolu, oil of lavender, or the essence of musk or ambergris. The first two can only be employed for dark varnishes.

Obs. The above varnishes are chiefly applied to articles of the toilette, as work-boxes, card-cases, &c.; but are also suitable to other articles, whether of paper, wood, linen, or metal, that require a brilliant and quick-drying varnish. They dry almost as soon as applied, and are usually hard enough to polish in 24 hours. They are, however, much less durable, and more liable to crack, than oil varnishes.

Varnish, Stopping-out. *Syn.* PETIT VERNIS, Fr. From lampblack, made into a paste with turpentine. Used by engravers. See ETCHING.

Varnish, Tingry's. MASTIC VARNISH.

Varnish, Toy. Similar to common spirit varnish, but using carefully rectified wood naphtha as the solvent. See LAC and SPIRIT VARNISH.

Varnish, Transfer. *Syn.* MORDANT VARNISH. *Prep.* From mastic (in tears) and sandarach, of each, 4 oz.; rectified spirit, 1½ pint; dissolve, and add of pure Canada balsam, ½ pint. Used for transferring and fixing engravings or lithographs on wood, and for gilding, silvering, &c. See CRYSTAL VARNISH.

Varnish, Turpentine. See MASTIC and OAK VARNISH.

Varnish, Wainscot. See OAK VARNISH.

Varnish, Wax. *Syn.* MILK OF WAX; EMULSION CERÆ SPIRITUOSA, L. *Prep.* Take of white wax (pure), 1 lb.; melt it with as gentle a heat as possible, add of warm rectified spirit, sp. gr. .830 (60 o. p.), 1 pint; mix perfectly, and pour the liquid out upon a cold porphyry slab; next grind it with a muller to a perfectly smooth paste, adding more spirit, as required; put the paste into a marble mortar, make an emulsion with water, $3\frac{1}{2}$ pints, gradually added, and strain it through muslin. *Used* as a varnish for paintings; when dry, a hot iron is passed over it, or heat is otherwise evenly applied, so as to fuse it, and render it transparent, after which, when quite cold, it is polished with a clean linen cloth. The most protective of all varnishes.

2. Wax (pure), 5 oz.; oil of turpentine, 1 quart; dissolve. *Used* for furniture. See SEALING-WAX VARNISH.

Varnish, White. See SPIRIT VARNISH, 2 a and b.

VARNISHING. To give the highest degree of lustre to varnish after it is laid on, as well as to remove the marks of the brush, it undergoes the operation of polishing. This is performed by first rubbing it with very finely powdered pumice-stone and water, and, afterwards, with an oiled rag and tripoli, until the required polish is produced. The surface is, last of all, cleaned with soft linen cloths, cleared of all greasiness with powdered starch, and then rubbed bright with the palm of the hand.

In varnishing, great care must be taken that the surface is free from grease or smoke; as, unless this be the case, the best oil or turpentine varnish in the world will not dry and harden. Old articles are usually washed with soap and water, by the painters, before being varnished, to prevent any misadventure of the kind alluded to.

VEAL. "The grain should be close, firm, and white, and the fat of a pinkish-white, not a dead white, and the kidneys well covered with a thick white fat." (Soyer.)

Veal, like pork, requires to be well dressed, to develop its nutritive qualities. It should also be eaten fresh, as a peculiar principle is generated in it when improperly kept, which acts as a malignant poison. See ROASTING, &c.

VEGETABLE ALKALI†. Potassa.

VEGETABLE JUICES. See below.

VEGETABLES. Vegetables are organic beings, which are distinguished from animals by a number of characteristics, but, like them, are composed of certain proximate principles, or compounds, which possess a high degree of scientific interest, and in many cases are invaluable to man. Among the most important of these are—albumen, gluten, gum, lignin, starch, sugar, tannin, wax, the fixed and volatile oils, the resins, and gum-resins, the alkaloids, and innumerable forms of extractive matter.

Several of these substances are noticed under their respective names.

The method of propagating plants from their seeds, depending on their simple exposure, at the proper season, to warmth and moisture, under the protection of the soil, is well known; that by propagation from 'slips' and 'cuttings,' which will doubtless prove interesting to the amateur gardener, are noticed below.

The choice of slips and cuttings should be made from the side shoots of trees and plants, and, when possible, from such as recline towards the ground, observing, when they are removed by the knife, to leave a little wood of a former year or season's growth attached to them, as such are found to take root more readily than when they are wholly composed of new wood. The time to take slips or cuttings is as soon as the sap gets into full motion. Before setting them the latter should be cut across, just below an eye or joint, with as smooth a section as possible, observing not to injure the bud. The superfluous leaves may be removed, but a sufficient number should be left on for the purposes of vegetation. The common practice of removing all or nearly all the leaves of cuttings is injudicious. In some cases leaves alone will strike root. When cuttings are set in pots, they should be so placed as to reach to the bottom and touch the sides throughout their whole length, when they will seldom fail to become rooted plants. In the case of tubular-stalked plants, it is said to be advantageous to insert both ends into the soil, each of which will take root, and may then be divided, when two plants will be produced instead of one. An equable temperature, a moist atmosphere, a shady situation, and a moderate supply of water, are the principal requisites to induce speedy rooting. Excess of any of these is prejudicial. When the size of the cuttings admit, it is better to place them under a hand- or bell-glass, which will preserve a constant degree of heat, and prevent evaporation from the surface of the leaves, which is the most common cause of their dying, especially in hot, dry weather.

Qual. The vegetable kingdom furnishes by far the larger portion of the food of man, and indirectly, perhaps, the whole of it. The great value of culinary vegetables and fruit in a mixed diet need not be insisted on, since it is a fact which is almost universally known and appreciated.

In the choice of culinary vegetables, observe, that if they are stiff and break freely and crisply, they are fresh, and fit for food; if, on the contrary, they have a flabby appearance, or are soft or discoloured, they are stale, and should be rejected.

The dose of the generality of vegetable substances that exercise no very marked action on the human frame is about $\frac{1}{2}$ to 1 dr. of the powder, night and morning; or 1 oz., or q. s. to impart a moderately strong colour or taste,

may be infused, or boiled, in 1 pint of water, and a wine-glassful or thereabouts, taken 2 or 3 times a day.

Collection and pres. The following general directions are given in the London Pharmacopœia for the collection and preservation of vegetable substances—(vegetabilia Ph. L.):—

"Vegetables are to be collected in dry weather, and when neither wet with rain nor dew; they are to be collected annually, and are not to be kept beyond a year.

"Barks are to be collected at that season in which they can be most easily separated from the wood." Spring is the season here alluded to; as at this time, after the sap begins to ascend, the bark is, in general, very easily separated.

"Flowers are to be collected recently blown." The red rose, however, must be gathered before the buds are expanded.

"Fruits and seeds are to be collected when ripe.

"Herbs and leaves are to be gathered after the flowers have expanded, and before the seeds are mature.

"Roots and rhizomes (underground stems), for the most part, are to be dug up after the old leaves and stalks have fallen, and before the new ones appear." ("Roots, which are required to be preserved fresh, should be buried in dry sand."—Ph. L. 1836.)

"Seeds are to be collected when they are ripe, and before they drop from the plant." ("They ought to be preserved in their seed vessels."—Ph. L. 1836.)

"The different parts of vegetables are to be kept dried for use, except where we shall otherwise direct. Expose those you wish to dry, within a short time after they have been gathered, in shallow wicker baskets, to a gentle heat, in a dark place, and where there is a current of air. Then, the moisture being driven off, gradually increase the heat to 150° Fahr., in order that they may be dried. Finally, preserve the more delicate parts, viz., flowers and leaves, in black glass vessels, well closed, and keep the rest in proper vessels, preventing the access of light and moisture."

Fruits, ordinary vegetables, and vegetable juice, of every class, may be preserved for any length of time by several of the methods described under PUTREFACTION. On the small scale, the following method is often adopted:—The substances to be preserved are put into strong glass or stoneware bottles, with necks of a proper size, which are then corked with the greatest care, tied or wired, and luted with a mixture of lime and soft cheese, or with a paste formed of linseed meal and water, spread on rags; or, tin cases are employed, and are soldered up instead of being corked. The bottles are then placed in an oven, the temperature of which is cautiously raised to fully 212° Fahr.; or, they are enclosed, separately, in canvas bags, and put into a copper of water to which some salt has been added,

which is then gradually heated until it boils, and thus kept for 15 or 20 minutes; the whole is next left to cool, when the bottles are taken out and carefully examined before being laid by, lest they should have cracked, or the lute have given way.

Herbs and flowers are now generally preserved for distillation by means of common salt. The objection which is raised against the use of fresh aromatic plants is thus obviated, whilst the odours of the distilled products are rendered superior to those obtained from either the recent or dried plant, fruit, or flower, without the great loss, inconvenience, or trouble attending the common methods. Besides, many aromatic and odorous substances almost entirely lose their properties by drying; while most of them yield more oil, and that of a finer quality, in the fresh than in the dried state. The odours of roses, elder flowers, and a variety of others, are vastly improved by this treatment, and these flowers may thus be preserved with ease and safety from season to season, or even longer, if required. The process simply consists in intimately mixing the flowers, or other vegetables, soon after being gathered, with about $\frac{1}{4}$ their weight, or less, of good dry salt, and ramming down the mixture as tightly as possible in strong casks. The casks are then placed in a cold cellar, and covered with boards, on which heavy weights are put, to keep the mass tight and close. See FRUITS, PUTREFACTION, &c.

Juices of Vegetables. 1. (EXPRESSED VEGETABLE JUICE, SIMPLE V. J.; SUCCI EXPRESSI, L.) These are obtained by bruising the fresh leaves, or other vegetable matter, in a marble mortar, or in a mill, and expressing the liquid portion by means of a powerful screw press. After defecation for 12 or 14 hours in a cold situation, the juice is either decanted or filtered from the feculous sediment, and is next heated for some minutes to about 185° Fahr., to coagulate albuminous matter. The clear portion is subsequently separated as before, and the product preserved for use in well-closed and well-filled bottles, in a cool situation. Some plants, as borage, cabbage, &c., require the addition of $\frac{1}{2}$ of water before being pressed. The expression of the juice of lemons, oranges, quinces, &c., is facilitated by previously mixing the pulp with clean chopped straw. Buckthorn berries, mulberries, &c., after being crushed between the hands, are commonly left for 3 or 4 days to undergo a slight fermentation, before pressing them.

The expression of the juices of the narcotic plants, and of some other vegetables, has lately assumed considerable interest, from these juices being now extensively used in pharmacy for the preparation of extracts and the preserved juices, noticed below. It appears that the juice of young plants just coming into flower yield only $\frac{1}{3}$ the amount of extract which may be obtained from the same quantity of juice expressed from the matured plant, or

when the flowers are fully blown, and the strength of the product is also inferior; the ease appears to be best met by selecting the plants when more than half the flowers are fully blown. The leaves alone should be preferably employed, and should be exclusively of the second year's growth, when the plants are biennials. (Squire.) The homœopathsists commonly employ the whole flowering herb.

THE INSPISSATED VEGETABLE JUICES (SUCCUS SPISSATIS) are now included among the extracts.

The principal simple vegetable juices of commerce are:—

BUCKTHORN JUICE (SUCCUS RHAMNI—Ph. L.), from the fruit of *Rhamnus catharticus*, or buckthorn berries.

CITRON JUICE (SUCCUS CITRI), chiefly imported from Italy in large casks.

LEMON JUICE (SUCCUS LIMONUM—Ph. L.), from lemons that spoil before they can be sold; also imported.

MULBERRY JUICE (SUCCUS MORI—Ph. L.), from the fruit of the mulberry.

ORANGE JUICE (SUCCUS AURANTII), obtained from the same source as that of lemons.

CONCENTRATED ORANGE JUICE (SUCCUS SPISSATIS AURANTII vel AURANTIORUM) and CONCENTRATED LEMON JUICE (SUCCUS SPISSATUS LIMONUM) are prepared by evaporating the fresh juices of oranges and lemons, either alone or mixed with sugar, and are employed as substitutes for the fruit, where the latter cannot be obtained.

2. (ALCOHOLISED VEGETABLE JUICES, PRESERVED V. J.; TINCTURES OF RECENT PLANTS; SUCCI ALCOHOLATI, L.; ALCOOLATURES, Fr.) *Prep. a.* The juice, obtained by powerful pressure, in the manner noticed above, is allowed to remain for 24 hours in a cold place, when the clear portion is decanted from the feculous matter which has subsided, and is then agitated with one half its volume of rectified spirit (56 o. p.); after another 24 hours the clear portion is again decanted and, if necessary, filtered through bibulous paper or linen. In this way are now generally prepared the preserved juices of aconite, belladonna, colchicum (corms), hemlock, henbane, foxglove, elaterium, lactuca virosa, taraxacum, &c., sold in this country.

b. (P. Cod.) To the fresh leaves, bruised in a marble mortar, is added an equal weight of rectified spirit, and, after maceration for 15 days, the whole is pressed, and the resulting tincture filtered. In this manner are prepared tinctures of the fresh leaves of aconite (tinctura aconiti cum foliis recentibus, belladonna, foxglove, hemlock, henbane, strong-scented lettuce (*Lactuca virosa*), stramonium, trailing poison oak (*Rhus toxicodendron*), mugwort (*Artemisia vulgaris*), colchicum (corms), squinting cucumber, white poppy, taraxacum, &c., &c., of the Paris Codex.

Obs. These tinctures are much more power-

ful, and more certain in their operation, than those prepared from the dried plants. The commencing dose is from 2 to 5 drops, the effects of which should be carefully watched. The products of the first of the above formulæ keep as well as the ordinary tinctures, and there is less waste of spirit than with the second. That of the P. Cod. is, however, preferred by M. Soubeiran, as affording more uniform products; an opinion which is questionable. Béal orders equal weights of juice and spirit; Mr. Squire recommends $\frac{1}{2}$ part; Messrs. Bentley & Davenport $\frac{1}{4}$ part (both by volume), and Mr. Gieseke only $\frac{1}{3}$ part (by weight), of spirit, to 1 part of the expressed juice. The homœopathsists generally go with M. Béal. "Our own experience, which has been very considerable, and extends over upwards of 16 years, leads us to prefer the proportions given in formulæ *a*, which are similar to those of Mr. Squire. If less spirit be employed, the product is apt to suffer rapid deterioration when kept in a warm shop or surgery." (Cooley.)

3. (ETHERIZED VEGETABLE JUICES; SUCCI ETHERIZATI, —L.; ÉTHÉROLATURES, SUCS ÉTHÉRÉS, Fr.) For these we are indebted to M. Bouchardat. They are prepared as follows: Ether is gradually added to the depurated freshly expressed juice, until, after active agitation, a thin layer of it rises to the surface on the mixture being allowed to repose for a minute or two; the whole is then set aside for 24 hours, when the supernatant ether is expertly removed by means of a pipette or syringe, and the juice is filtered; lastly, the decanted ether is returned to the filtrate, and the etherised juice is at once put into well-stoppered bottles. For use, one of the bottles is reversed, and the dose taken from the lower part, so that the ether remains behind. We find, in practice, that decantation, carefully conducted, may be substituted for filtration; thus not only rendering the process less costly, but ensuring a more uniform product.

The etherised juices are said to retain their active properties for an indefinite period. The method has been successfully applied to the juices of aconite, anemone, black hellebore, and hemlock, and is probably applicable to many others; but, we think, not to the juices of all the narcotic plants, as has been asserted.

VEGETATION (Metallic). This name has been fancifully applied to the following:—

LEAD TREE; ARBOR SATURNI. Take of sugar of lead, 1 oz.; distilled water, 1 $\frac{1}{2}$ pint; acetic acid, a few drops; dissolve, place the liquid in a clear white glass bottle, and suspend a piece of zinc in it, by means of a fine thread.

SILVER TREE; ARBOR DIANE. From nitrate of silver, 20 grs.; water, 1 fl. oz.; dissolve in a phial, and add about $\frac{1}{2}$ dr. of pure mercury.

TIN TREE; ARBOR JOVIS. From chloride

of tin, 3 drs.; nitric acid, 10 to 15 drops; distilled or rain water, 1 pint; dissolve in a white glass bottle, and hang in it, by a thread, a small rod of zinc.

Obs. In the above experiments, the metals are precipitated in a very beautiful arborescent form. It is curious to observe the laminæ shoot out, as it were, from nothing, assuming forms resembling real vegetation. This phenomenon results from voltaic action being set up between the liquid and the metal.

VEGETO-AL/KALI. See ALKALOID.

VEL/LUM. A fine kind of parchment prepared from the skins of calves, kids, and lambs. The skins are limed, shaved, washed, and stretched in hoops or other frames, where they are scraped and trimmed with the currier's fleshing-knife, and next carefully rubbed down with pumice-stone; they are, lastly, polished with finely powdered chalk or fresh-slaked lime, and then dried. A green colour is given with a solution of crystallised verdigris, to which a little cream of tartar and nitric acid has been added; and a blue colour, with a solution of indigo. The surface is often finished off with white of egg, and subsequent friction.

The skins of sheep are commonly used for parchment; those of he-goats and wolves for drum-heads; and those of the ass, for battle-dores. The species of vellum, used for church services by binders is said to be prepared from pig-skins. See POUNCE.

VEL/VET COLOURS. *Syn.* MAP STAINS, PAPER S.; LACCA FLUIDA, L. *Prep.* 1. (BLUE).—*a.* Dissolve litmus in water, and add $\frac{1}{2}$ of spirit of wine.—*b.* Dilute Saxon blue or sulphate of indigo with water. If required for delicate work, neutralize the acid with chalk.—*c.* To an aqueous infusion of litmus add a few drops of vinegar, until it turns of a full blue.

2. (GREEN).—*a.* Dissolve crystallised verdigris in water.—*b.* Dissolve sap green in water, and add a little alum.—*c.* Add a little salt of tartar to a blue or purple solution of litmus, until it turns green.—*d.* Dissolve equal parts of crystallised verdigris and cream of tartar in water.

3. (PURPLE).—*a.* Steep litmus in water, and strain the solution.—*b.* Add a little alum to a stained decoction of logwood.—*c.* Add a solution of carmine (red) to a little blue solution of litmus or Saxon blue.

4. (RED).—*a.* Macerate ground Brazil wood in vinegar, boil a few minutes, strain, and add a little alum and gum.—*b.* Add vinegar to an infusion of litmus until it turns red.—*c.* Boil or infuse powdered cochineal in water containing a little ammonia or sal volatile.—*d.* Dissolve carmine in liquor of ammonia, or in weak carbonate of potash water; the former is superb.

5. (YELLOW).—*a.* Dissolve gamboge in water, and add a little alum.—*b.* Dissolve gamboge in equal parts of proof spirit and water. Golden coloured.—*c.* Steep French berries in boiling

water, strain, and add a little alum.—*d.* Steep turmeric, round zedoary, gamboge, or annotta, in a weak ley of subcarbonate of soda or potash.

Obs. The preceding, thickened with a little gum, are used as inks for writing, as colours to tint maps, foils, paper, artificial flowers, &c., and to paint on velvet. Some of them are very beautiful. Those containing litmus are, however, fugitive. It must be observed, that those made with strong spirit do not mix well with gum water, unless somewhat diluted with water. Any other transparent colours or stains may be employed for painting on velvet, as well as the above.

VELVET LEAF. *Syn.* PAREIRA BRAVA, PAREIRA (Ph. L. E. & D.), L. "The root of *Cissampelos Pareira*" (Ph. L.), white pareira or velvet leaf. It is tonic, aperient, and diuretic.—*Dose.* 20 to 60 grs.; in chronic and purulent inflammation and extreme irritability of the bladder; in leucorrhœa, dropsy, ulceration of the kidney, &c.

VEN/ISON. The flesh of several species of deer. That from good land, killed at the proper season, and eaten in a moderately fresh state, is most easily digestible, and, perhaps, the most wholesome, of all the red meats; but when it is 'high,' or in a state of incipient putrefaction, it is far from wholesome, and often poisonous.

VENO BENO (La). See TEA.

VENTILA'TION. The proper ventilation of our habitations, as well as of other buildings in which we pass any considerable portion of our time, is quite as necessary to health as food and clothing. Lavoisier, writing in the middle of the last century, remarks—"It is certain that mankind degenerate when employed in sedentary manufactures, or living in crowded houses, or in the narrow lanes of large cities; whereas they improve in their nature and constitution in most of the country labours which are carried on in the open air." Yet many persons, by the care which they take to shut out fresh air, and to prevent the escape of that which their own bodies, by pulmonary and surfacial respiration, have contaminated, would seem to hug to themselves the discomfort of breathing over and over again an impure and unrefreshing atmosphere, and to be anxious to finish their career by lingering suicide. The almost universal indifference to the subject, considering its importance, is unaccountable.

The first step towards effecting and maintaining a liberal supply of fresh air, is either by means of ventilators or by regularly opening the windows for stated periods daily. During the colder portion of the year, when fires are kept burning, and there is an up-current in the chimney, nothing is so simple and effective as the well-known chimney-valve of Dr. Arnott; and, indeed, without this, open fires are powerful instruments of ventilation. In cold weather, where expense is not an ob-

ject, the apartments may be supplied with air that has been previously warmed by passing through a heated chamber, on the principle recommended by Dr. Reid; but care must be taken that, in warming the air, we do not over-heat it, nor contaminate it.

A sufficient supply of light, another powerful sanitary agent, is now regarded as nearly as essential as thorough ventilation, and the two are commonly treated of together. According to Palladio, the opening of windows should not exceed a fourth, nor be less than a fifth, of the length of the side of a room, and should be in height two and one sixth times the width. Mr. Gwilt, another high authority on this subject, has given as a definite rule, that we should allow 1 square foot of glass to every 100 cubic feet of space in any apartment or enclosure. A great deal must, however, depend on the shape of the apartment; but, in all cases, care should be taken that the windows are placed at the longest side of the room, and not at the narrowest, or the end of it. A southern aspect affords the most light and heat; a northern one, the most diffused and least variable light, and is hence usually chosen by artists for their studios.

VERATRINE. $C_{20}H_{23}N_3O_8$. *Syn.* VERATRIA, VERATRINA, SABADILLINE; VERATRIA (B. P., Ph. L. & E.), L. An alkaloid discovered by Pelletier and Caventou, in the seeds of *Asagrea officinalis* (sabadilla), and in the rhizomes of *Veratrum album* (white hellebore).

Prep. 1. (Ph. E.) Digest sabadilla seeds in boiling water for 24 hours, then squeeze them, dry them thoroughly by a gentle heat, beat them in a mortar, and separate the seeds from the capsules by agitation in a deep and narrow vessel; next grind the seeds in a coffee-mill, and exhaust them by percolation with rectified spirit; concentrate the resulting tincture by distillation, so long as no deposit forms, and pour the residuum, whilst still hot, into 12 times its volume of cold water; then filter through calico, and wash the residuum on the filter as long as the washings yield a precipitate with ammonia; unite the filtered liquid with the washings, add ammonia in excess, collect the precipitate on a filter, wash it slightly with cold water, and dry it first by imbibition with filtering paper, and then in the vapour bath. "The product is not pure, but sufficiently so for medical use. From this coloured substance it may be obtained white, but at considerable loss, by solution in very weak hydrochloric acid, decolorisation with animal charcoal, and reprecipitation with ammonia."

2. (Ph. L. 1836.) This is the same in principle as the last; a tincture is formed by boiling the seeds in rectified spirit, which is then evaporated to a syrup, dissolved in very dilute sulphuric acid, the veratrine precipitated with magnesia, redissolved in very dilute acid, treated with animal charcoal, the filtrate again

evaporated to a syrup, and precipitated with ammonia; it is, lastly, washed and dried.

3. By means of ether, as noticed under ALKALOID and ACONITINE. This is by far the best method.

Prop. Pure veratrine is perfectly white; but as usually met with, it is a yellowish or greenish-white powder; it is highly acid; uncrystallisable; scarcely soluble in water, soluble in ether, and freely soluble in hot alcohol; heated to about 125° Fahr., it fuses like wax, and solidifies, upon cooling, to a transparent yellow mass. With the dilute acid it forms salts, which are either amorphous or difficultly crystallisable. The smallest possible portion of its powder causes violent sneezing.

Tests. 1. Potassa, ammonia, and their carbonates, give flocculent white precipitates, which at first are not crystalline under the microscope, but which, after some minutes, assume the appearance of small scattered clusters of short prismatic crystals; they are insoluble in excess of potassa and its carbonate, and only very slightly so in excess of ammonia.—2. With sulphuric acid it strikes an intense red colour, changing afterwards to crimson, and finally to violet.—3. A dilute acetic solution of veratrine is turned to a superb red by strong sulphuric acid.

Veratrine is distinguished from brucine and the other alkaloids by its fusibility—by the crystalline form of its precipitate with potassa, and—by its reaction with oil of vitriol.

Uses, &c. "As an external application, it has been efficaciously employed by Magendie in France, and by Dr. Turnbull in this country; but the extravagant eulogies of the latter have not tended to confirm the reputation of this remedy." (Dr. A. T. Thomson.) From 6 to 12 grs., dissolved in 1 fl. oz. of rectified spirit, as a liniment; or 30 grs., mixed with 1 dr. of olive oil, and 1 oz. of lard, as an ointment, have been occasionally found very serviceable in neuralgia, and other like painful affections, and in gouty and rheumatic paralysis. As an internal remedy, it possesses no advantage, as it merely acts as a violent and depressing cathartic.—*Dose.* ~~gr. to 1 gr.~~ In larger doses, it acts as a powerful irritant poison. For antidotes, &c., see ALKALOID.

VERATRUM. See WHITE HELLEBORE.

VERDIGRIS. *Syn.* ERUGO, L.; VERT-DE-GRIS, Fr. This is a mixture of several basic acetates of copper which have a green or blue colour. It is obtained in the wine districts of the south of Europe, by the action of refuse grapes, from which the juice has been expressed, on thin sheets of copper. When pure, it should dissolve, almost entirely, and without effervescence, in dilute sulphuric acid. It is very poisonous; for antidotes, see COPPER.

An inferior quality of verdigris is now prepared from pommage, or apple marc, in the cider districts of England.

Verdigris, Distilled. *Syn.* CRYSTALLISED VERDIGRIS. This name is applied to the normal acetate of copper, which is prepared in the wine districts by dissolving ordinary verdigris, 1 part, in good distilled vinegar, 2 parts; the operation being performed in a copper vessel, by the aid of a gentle heat and agitation; the solution is afterwards slowly evaporated until a pellicle begins to form on the surface, when it is transferred into glazed earthen pans ('ouglas'), in each of which is placed 2 or 3 cleft sticks, and it is then left in a warm apartment for 14 or 15 days, to crystallise.

A spurious article is often prepared by adding a solution of sulphate of copper, 12½ lbs., to a solution of sugar of lead, 19 lbs., or q. s., and filtering, evaporating, and crystallising the mixture.

There is an acetate of copper and lime which resembles distilled verdigris in colour. It was manufactured pretty extensively in Scotland some years ago, and fetched a high price, till Dr. Ure published an analysis of it in the 'Edin. Phil. Trans.' It is much inferior for all uses in the arts.

Pure distilled verdigris is entirely soluble in water, and is not precipitated on the addition of sulphuric acid or of ammonia in excess.

Verdigris, English. *Prep.* Blue vitriol, 12 lbs.; white vitriol, 16 lbs.; sugar of lead, 24 lbs.; alum, 2 lbs.; (all coarsely powdered;) mix, and heat them in a pot over the fire until they unite into a mass. Sold by fraudulent dealers for foreign verdigris.

VERDITER. *Syn.* BLUE VERDITER, REFINER'S VERDITER, CENDRES BLEUES, Fr. A blue pigment, obtained by adding chalk, whitening, or milk of lime, to a solution of copper in nitric acid; or, by triturating recently precipitated and still moist carbonate of oxide of copper with hydrate of lime.

Prep. A quantity of whitening or milk of lime is put into a tub, and upon this the solution of copper is poured; the mixture is stirred every day for some hours together, until the liquor loses its colour; it is then poured off, and more solution of copper added; this is repeated until the whitening or lime has acquired the proper colour; the whole is then washed with water, drained, spread on chalk stones, and dried in the sun.

Obs. The cupreous solution employed in the above process is made by neutralising the nitric solution obtained from the refiners of gold and silver, by heating it along with metallic copper. For the finer qualities of verditer the lime should be of the purest kind, and the cupreous precipitate should be carefully triturated with it, after it is nearly dry, by which a fine velvety appearance is produced. The 'cendres bleues en pâtes' of the French differ from the above mainly in a solution of chloride of copper being employed, and in the resulting green precipitate being turned blue by the action of carbonate of potassa. Verditer is made into crayons whilst moist, or

dried into a powder, or it is used as a water colour in the moist state.

Verditer, Green. *Syn.* BREMEN GREEN. The process for refiner's verditer frequently mis-carries, and a green colour is produced instead of a blue one. It may also be obtained directly by omitting the 'blueing up' with carbonate of potassa, mentioned above.

VERJUICE. *Syn.* AGRESTA, OMPHACIUM, L. The expressed juice of unripe grapes. The term is also often extended to the expressed juice of the wild or crab apple. It was formerly used as an astringent and refrigerant in medicine; but it is now principally employed as an ingredient in sauces, ragouts, &c.

VERMICEL/ILI. This, like macaroni, is prepared from a stiff paste made of a peculiar fine kind of granular wheat flour, called semoule, which is mixed up with hot water, and, after being well kneaded, is formed into small ribands, cylinders, or tubes, by being placed in a vertical cylinder press, the bottom of which is filled with proper-shaped holes, through which it is driven by an iron plate or 'follower' being forced down by a powerful screw. The pieces that protrude are broken off, twisted into any desired shape upon paper, and dried. Those in the form of fillets or ribands are called 'lazagnes.' See MACARONI.

VERMIFUGES. *Syn.* ANTHELMINTICS; ANTHELMINTICA, HELMINTHAGOGA, VERMIFUGA, L. Medicines employed to destroy or expel intestinal worms. Some of these, as coarsely powdered tin- and iron-filings and cowhage, act as mechanical agents, by irritating the worms; others have a specific action upon worms, as male fern, koussou, santonin, &c.; others, again, owe their power to their action as purgatives, as calomel, gamboge, jalap, &c. See WORMS.

VERMILION. *Syn.* FACTITIOUS CINNABAR, RED SULPHIDE OF MERCURY, RED SULPHURET OF MERCURY. This article may be prepared both in the moist and dry way; that of commerce is almost entirely obtained by the latter.

Prep. 1. By sublimation. Take of pure mercury, 202 parts; pure sulphur, 33 parts; fuse them together by a gentle heat, observing not to allow the mass to take fire; when fused, cover over the vessel, and, when the whole has become cold, powder the mass, and sublime it in a closed vessel, so placed in a furnace that the flame may freely circulate and play upon it to about half its height, the heat being at first gradually applied, and afterwards augmented until the lower part of the subliming vessel becomes red hot; the cold sublimate is broken into pieces, ground along with water to a fine powder, elutriated, passed through a sieve, and dried. *Prod.* Fully 112½ of the weight of the mercury employed.

2. In the humid way. (Brunner.) Take of pure quicksilver, 300 parts; pure sublimed sul-

3. (Oettinger.) Cantharidal ether (prepared from cantharides, 1 part; ether, 2 parts), and sulphuric ether, of each, 10 dr.; turpentine and black resin, of each, 2½ drs.; mix, dissolve, and apply it to the surface of stretched silk or taffeta which has been previously prepared with two coatings of a solution of isinglass.

Obs. The above compounds are spread on leather, linen, paper, silk, oiled silk, taffeta, &c., and then form the numerous compounds vended under the names of—blistering tissue, charta epispastica, rannus vesicatorius, papier epispastique, sparadrapum vesicatorium, taf-fetas vesicans, tela vesicatoria, &c.

Acetic extract of cantharides, croton oil, or extract of mezereum, is sometimes substituted for the ethereal extract ordered in the above formulæ.

The 'papier epispastique' of Vée is prepared of three strengths, which are respectively distinguished by the colours white, green, and red. The composition is made by boiling powdered cantharides for an hour with water, lard, and green ointment, or with lard coloured with alkanet root, adding white wax to the strained fats, and spreading the mixture whilst fluid:—No. 1 is made with 10 oz. of cantharides to 4 lbs. of lard; No. 2 of 1 lb. of cantharides to 8 lbs. of green ointment; and No. 3, of 1½ lb. of flies to 8 lbs. of reddened lard. To each are added 2 lbs. of white wax. (Dorvault.)

The magistral blister of Valleix is a revival of the vesicating epithem. See BLISTER, CANTHARIDES, COLLODION, &c., and *below*.

VESICATION. The formation of a blister is a vital process, and its success may be taken as a proof of the presence of life. Hence, a French physician, Dr. Mandl, has suggested such a stimulation of the skin as would ordinarily cause a blister as a test of life, in those cases of long-continued trance which we occasionally hear of, where all the functions of life seem to be extinct. Dr. Mandl's plan is to apply a stick of lunar caustic. The application of a little strong vinegar of cantharides, or other cantharidal blister, of the size of a sixpenny piece, or of two or three spoonfuls of boiling water by means of a bent tube of like diameter, is however, more certain and satisfactory.

VESICATORIN. *Syn.* CANTHARIDIN, CANTHARIDINA, CANTHARIDES-CAMPHOR. The blistering principle of Spanish flies, discovered by M. Robiquet.

Prep. 1. (P. Cod.) Exhaust powdered cantharides with concentrated alcohol, by percolation; distil off the spirit from the filtered tincture, and leave the residuum to deposit crystals; these may be purified by dissolving them in boiling alcohol, digestion with animal charcoal, filtration whilst hot, and crystallising by refrigeration.

2. (Thierry.) Macerate cantharides (in coarse powder) for several days in ether, in a

closed displacement apparatus; then, after the whole of the soluble matter has been extracted by the addition of fresh portions of ether, pour on sufficient water to displace the retained ether; next distil off the ether, dissolve the remaining extract in boiling alcohol, filter while hot, and abandon the filtrate to spontaneous evaporation. *Prod.* 54.

3. Digest the aqueous extract of cantharides in hot alcohol, filter, evaporate to dryness, digest the residuum in sulphuric ether, evaporate, and slightly wash the resulting crystals with cold alcohol.

Prop., &c. Micaceous plates resembling spermaceti; fusible; vaporizable; insoluble in water; soluble in ether, oils, acetic acid, and hot alcohol; powerfully vesicant and poisonous. Its vapour, even at ordinary temperatures, frequently produces temporary blindness. The 1-100th part of a grain, placed on a piece of paper, and applied to the edge of the lower lip, caused small blisters in 15 minutes, which, when rubbed with a little simple cerate, extended over a large surface, and covered both lips with blisters. (Robiquet.)

VETCH. The common name of various leguminous plants of the genera *Vicia* and *Ervum*, now much cultivated as green fodder for milch cows and working stock. The seeds (tares) were formerly reputed detersive and astringent. Those of "the Canadian variety make good bread." (Lindley.)

VETERINARY MEDICINES. The common form of medicine for horses, is that popularly known as horse balls. They are usually prepared by mixing the dry ingredients, in the state of powder, with a sufficient quantity of treacle, or syrup bottoms, to give the mass a proper consistence for rolling into balls; adding, when necessary, linseed meal, or any other simple powder, to increase the bulk. The usual practice among the veterinary druggists is to keep a compound known in the trade as 'ball-mass,' or 'common mass,' ready prepared to give form and bulk to more active ingredients. This is usually made of about equal parts of linseed meal and treacle, together with a little palm or lard, thoroughly incorporated by kneading with the hands; and it is kept in a cool situation, tied over to prevent it drying and hardening. For use, the ball-masses are either rolled or moulded into small cylinders of about 1½ to 1¾ oz. in weight; and in size, from 2 to 2½ inches long, and from about ¼ to ¾ of an inch in diameter; and they are wrapped in soft paper, which is administered with them. Those for dogs are commonly formed into large boluses or nut-like pieces. The common practice, in some houses, of adding a little salt of tartar or acetate of potassa to ball-masses kept in stock, for the purpose of preserving them in a soft state, is not to be commended, since these articles decompose many of the saline and mineral compounds which are subsequently added to them.

Medicines for neat cattle are always administered in a liquid form, popularly called drenches. A similar plan is adopted with small cattle, as sheep and goats. For these, however, the quantity should seldom exceed $\frac{1}{2}$ pint. In all cases, drenches should be very slowly administered.

The following are a few useful horse-balls:—

ALTERATIVE BALLS.—1. Levigated sulphuret of antimony, sulphur, and linseed meal, of each, 3 oz.; nitre, $\frac{1}{2}$ oz.; palm oil, q. s. to form a mass; for 12 balls. One to be taken every day, or every other day.

2. (Bell.) Sulphuret of antimony, nitre, sulphur, and ethiop's mineral, of each, 3 oz.; soft soap, 10 oz.; oil of juniper, $\frac{1}{2}$ oz.; for 12 balls. As the last.

3. (White.) Sulphuret of antimony, caraway, and treacle, of each, $\frac{1}{2}$ oz.; for one ball. As the last.

CORDIAL BALLS.—1. (Blaine.) Coriander seed, caraway, and gentian, of each, 8 oz.; ginger, 4 oz.; oil of aniseed, $\frac{1}{2}$ oz.; honey or palm oil, q. s. to form a mass. Cordial, warming, and stomachic.—*Dose.* $\frac{1}{2}$ oz.

2. (Hill.) Anise, caraway, and cumin seed, of each, 4 lbs.; ginger, 2 lbs.; treacle, q. s.; divide into 12-oz. balls. *Prod.* 21 lbs.

COUGH BALLS.—1. (Blaine.) Ipecacuanha, 1 dr.; camphor, 2 drs.; honey, q. s. to form a ball. One night and morning.

2. (B. Clark.) Emetic tartar and benzoin, of each, 2 drs.; squills, 4 drs.; spermaceti and balsam of copaiba, of each, 1 oz.; elecampane and sulphur, of each, 2 oz.; syrup of poppies, q. s. to mix; for 8 balls. As the last.

DIURETIC BALLS.—1. (Bracy Clark.) Nitre and common turpentine, of each, 1 lb.; Castile soap, $\frac{1}{2}$ lb.; barley meal, 2 $\frac{1}{2}$ lbs., or q. s. For common-sized balls.

2. (Morton.) Digitalis, 1 oz.; aloes, 2 oz.; liquorice, 13 oz.; honey or Barbadoes tar, q. s. to mix; for 1-oz. balls. One, twice a day, with care.

PHYSIC BALLS, PURGING B., CATHARTIC B.—1. Aloes and hard soap, of each, 5 oz.; salt of tartar and cayenne pepper, of each, 1 oz.; melt together. For 8 balls.

2. (Vet. Coll.)—*a.* (Common physic ball.) Aloes, 8 oz.; treacle, 3 oz.; olive oil, 1 oz.; melted together.—*Dose.* 1 to 1 $\frac{1}{2}$ oz.

b. (Stronger ball.) To each dose of the last, add of croton oil, 4 to 8 drops.

Obs. The dose of the above is 1 ball, fasting, in the morning, preceded by a bran mash, on one or two successive nights, and followed by gentle exercise until the ball begins to operate.

WORM BALLS.—1. Barbadoes aloes, 5 drs.; calomel and ginger, of each, 2 drs.; oil of cloves, 12 drops; treacle, q. s. for a ball.

2. (J. Bell & Co.) Barbadoes aloes, 5 to 8 drs.; powdered tin, ethiop's mineral, and ginger, of each, 2 drs.; oils of aniseed and savine, of each, 20 drops; treacle, q. s. for a ball.

3. (Clater.) Sulphur and emetic tartar, of each, 1 dr.; linseed meal, 4 drs.; palm oil, q. s. to form a ball. One every morning, having prepared the animal with a physic ball containing 1 dr. of calomel. See BALLS; also Tyson's 'Veterinary Pharmacopœia.'

VINEGAR. *Syn.* ACETUM, L.; VINAIGRE, Fr. Dilute acetic acid, more or less contaminated with gum, sugar, and vegetable matter.

1. **MALT VINEGAR; ACETUM, BRITISH VINEGAR (B. P.); ACETUM BRITANNICUM (Ph. L. & E.), L.** This is the ordinary coloured vinegar consumed in this country, and is correctly described in the Ph. L. as "impure (dilute) acetic acid, prepared by fermentation from an infusion of malt (malt-wort)."

In the manufacture of MALT VINEGAR a mixture of malt and barley is mashed with hot water, and the resulting wort fermented, as in the common process of brewing. The liquor is then run into barrels, placed endways, tied over with coarse canvas, and arranged side by side in darkened chambers, moderately heated by a stove, and freely supplied with air. Here it remains till the acetous fermentation is nearly complete, which usually occupies several weeks, or even months. The newly formed vinegar is next run off into two large tuns, furnished with false bottoms, on which some 'rape' (the pressed cake from making domestic wines, or the green twigs or cuttings of vines) is placed. One of these vessels is wholly, and the other only about 3-4ths, filled. The fermentation recommences, and the acetification proceeds more rapidly in the latter than in the former tun, and the liquor it contains consequently matures the sooner. When fit for sale, a portion of the vinegar is withdrawn from the smaller quantity, and its place supplied with a like quantity from the full tun, and this in its turn is refilled from the barrels before noticed. This process is carried on with a number of tuns at once, which are all worked in pairs.

Prop., &c. The general properties of malt vinegar are well known. Its pleasant and refreshing odour is chiefly derived from acetic acid and acetic ether. Its strength is distinguished by the makers as Nos. 20, 22, and 24; the last of which, also called 'pr. r. vinegar,' is the strongest, and usually contains about 4.6% of real or about 5% of glacial acetic acid. Its density varies according to the quantity of foreign matter which it contains. Sp. gr. 1.017 to 1.019—B. P. This vinegar usually contains a small quantity of sulphuric acid. The presence of 1-1000th part of this acid is allowed by law.

Pur. "Brownish; of a peculiar odour. Its sp. gr. is 1.019. 1 fl. oz. of the acid is saturated by 1 dr. of the crystals of carbonate of soda. If, after 10 minims of solution of chloride of barium have been added to the same quantity, more of the chloride be poured into the filtered acid, nothing further is thrown

down. The colour is not changed by the addition of hydrosulphuric acid." (Ph. L.)

2. WINE VINEGAR, FRENCH V.; ACETUM GALLICUM (Ph. E. & D.), A. VINI, L.; VINAIGRE D'ORLEANS, Fr. This is prepared, in wine countries, from grape juice and inferior new wines, worked up with wine- lees, by a nearly similar process to that adopted for malt vinegar. That prepared from white wine (WHITE-WINE VINEGAR) is the most esteemed. It is purer and pleasanter than malt vinegar. Sp. gr. 1.014 to 1.022—Ph. E.; 1.016—Phillips. It usually contains from 5 to 6% of acetic acid. "100 parts of good Orleans vinegar should require 10 parts of dry carbonate of potassa for saturation." (Soubeyran.)

3. GERMAN, or QUICK-METHOD OF MAKING VINEGAR; PROCESS OF HAM. This method is based upon the fact, that acetification is the mere oxidation of alcohol in contact with organic matter. Hence, by employing dilute alcohol, or liquors containing it, and by vastly enlarging the surface of the liquid exposed to the air at a proper temperature, we may reduce the period occupied in acetification from weeks to as many hours. In practice this is effected by causing the dilute spirit, previously mixed with 1-1000th part of sugar or malt extract, or the fermented and clarified malt-wort, to slowly trickle down through a mass of beech shavings steeped in vinegar, and contained in a vessel called a vinegar generator (essigbiller), or graduation vessel. This is an oaken tub, narrower at the bottom than at the top, furnished with a loose lid or cover, below which is a perforated shelf (colander or false bottom), having a number of small holes, which are loosely filled with packthread about 6 inches long, and prevented from falling through by a knot at the upper end. The shelf is also perforated with four open glass tubes, as air-vents, each having its ends projecting above and below the shelf. This arrangement is repeated a second and a third time, or even oftener, according to the size of the vessel. The tub or graduator at its lower part is pierced with a horizontal row of eight equidistant round holes, to admit atmospheric air. One inch above the bottom is a syphon-formed discharge pipe, whose upper curvature stands one inch below the level of the air-holes in the side of the tub. The floors or partitions of the tub or generator being covered with birch twigs or beech chips to the depth of a few inches, the alcoholic liquor (first heated to between 75° and 83° Fahr.) is introduced at the upper part of the apparatus. This immediately commences trickling slowly down through the holes by means of the packthreads, diffuses itself over the chips or twigs forming the respective strata, slowly collects at the bottom of the tub, and then runs off by the syphon pipe. The air enters by the circumferential holes, circulates freely through the tub, and escapes by the glass tubes. As the acetification proceeds, the temperature of

the liquid rises to 100° or 105° Fahr., and remains stationary at that point while the action goes on favorably. The alcoholic solution or wort requires to be passed three or four times through the cask before acetification is complete, which is, in general, effected in from 24 to 36 hours.

Obs. For the production of a superior vinegar by this process, it is necessary that the spirit employed be sufficiently pure, not to contaminate the product with its flavour or odour, and that the malt-wort should be fermented and treated with all the care usually employed in the production of beer. The best English manufacturers who have adopted this process are in the habit of filtering or clarifying their fermented wash, and also of storing it away for several months before they subject it to acetification in the graduator. The most favorable temperature for the process is about 90° Fahr., and this should be preserved, as much as possible, by artificial means. *Prod.* A malt-wort of the sp. gr. 1.072, or, in "technical language, weighing about 26 lbs. per barrel, afforded a vinegar containing 5.4% of pure acetic acid, and a residuary extract of 10 lbs., from 36 galls. The former of these would indicate 35 lbs. of sugar, or 13.7 lbs. per barrel of gravity; whilst the latter shows 3.8 lbs. per barrel; the two united being only 17.5 lbs., instead of 26, the original weight. The loss, therefore, has been 8.5 lbs., or from a sp. gr. of 1.072 to less than 1.050." (Ure.) Thus, about one third of all the extractive matter of the malt is lost or dissipated during the processes of fermentation and acetification. According to Knapp, a mixture of about 80 galls. of water, 9 galls. of spirit of from 44 to 45% Tralles (18 or 20 u. p.), and 3 galls. of vinegar containing 3.5% of real acid, forming together 92 galls., yield, on an average, an almost equal quantity of vinegar, or about from 90 to 91 galls. of the above-stated strength.

4. WOOD VINEGAR. See PYROLIGNEOUS ACID.

5. OTHER VARIETIES OF VINEGAR, of minor importance; chiefly domestic, and commonly 'worked' as malt vinegar.—ALE VINEGAR, ALEGAR; ACETUM BERNVISLE. From strong pale ale which has soured.—ARGOL VINEGAR; ACETUM EX TARTARO. From white argol or cream of tartar, 1 lb.; dissolved in boiling water, 2 galls.; with the addition, when cold, of proof spirit or whiskey, 3 pints.—CRYSTAL VINEGAR. Pickling vinegar, discoloured with fresh burnt animal charcoal.—CIDER VINEGAR. From cider, worked as malt vinegar.—GERMAN HOUSEHOLD VINEGAR. From soft water, 7½ galls.; honey or brown sugar, 2 lbs.; cream of tartar, 2 oz.; corn spirit or whiskey, 1 gall.—GOOSEBERRY VINEGAR. From bruised gooseberries and brown sugar, of each 1½ lb.; water, 1 gall. Other fruits may be substituted for gooseberries.—PICKLING VINEGAR. The strongest pale malt

vinegar.—**RAISIN VINEGAR.** From the marc left from making raisin wine, 1 cwt. to every 12 or 15 galls. of water, along with a little yeast.—**SUGAR VINEGAR.** From brown sugar, 4 lbs. to each gallon of water.—**WHISKEY VINEGAR.** From whiskey, 1 pint; sugar, 2 oz.; yeast, a dessert-spoonful.

Pur., tests, & assay. These are, for the most part, rather fully noticed under **ACETIC ACID**, **ACETIMETRY**, and above. The following additional tests, &c., may, however, be useful:—1. Paper written on or smeared with pure vinegar is not charred when strongly warmed before the fire; if it is, the sample examined contained fully 2½ of oil of vitriol.—2. A small porcelain capsule, or china cup, dipped into a solution of sugar in 30 times its weight of water, and then heated to a temperature equal to that of boiling water, is not materially discoloured when a drop of pure vinegar is poured on it; but a spot of an intensely brown or black colour is formed if the sample contain only 1-300th part of sulphuric acid; if it contains only 1-1000th part, the spot is olive green; and if a less quantity, then only of a pale green colour.—3. The heavy white precipitate given with chloride of barium (see *above*) shows the presence of sulphuric acid; each grain, after being dried, and gently ignited, represents .344 grs. of dry sulphuric acid. If the precipitate from 1000 grs. of the vinegar exceeds 2½ grs., it contains an illegal quantity of this acid.—4. If a solution of nitrate of silver gives a cloudy white precipitate, hydrochloric acid is present.—5. If, after the addition of 2 or 3 grs. of carbonate of potash, and evaporation of the sample to dryness, the residuum deflagrates when ignited, the sample under examination contains nitric acid.—6. If the vinegar be blackened by sulphuretted hydrogen or hydrosulphuret of ammonia, it contains either lead or copper. If it gives a yellow precipitate with iodide of potassium or chromate of potash, the metal is lead. If ferrocyanide of potassium gives a bronze-brown coloured precipitate, or a little olive oil, when agitated with some of the vinegar, be turned green, the metal is copper.—7. If a small sample, gently evaporated to dryness, leaves more than 1½ of residuum, and this has a sweet taste, it is undecomposed sugar. The presence of acrid substances, as capsicum, chillies, grains of paradise, mustard seed, pellitory of Spain, pepper, &c., may be detected by neutralising the acidity of the vinegar with carbonate of soda, when the acrid taste of the adulterant will be readily perceived.

Vinegar, Aromatic. *Syn.* **ACETUM AROMATICUM**, L. *Prep.* 1. Glacial acetic acid, 1 lb.; oil of cloves, 1½ dr.; oil of rosemary, 1 dr.; oils of bergamot, cinnamon, pimento, and lavender, of each, ¼ dr.; neroli, 20 drops; camphor, 2½ oz.; rectified spirit, 2 fl. oz.; mix. Very fine.

2. (Henry's.) From glacial acetic acid,

strongly scented with the oils of cloves, lavender, rosemary, and *Calamus aromaticus* to which the usual quantity of camphor is added. This is the formula adopted at Apothecaries' Hall.

3. (Extemporaneous.) From acetate of potash (dry), 1 dr.; oil of vitriol, 20 drops; oils of lemon and cloves, of each, 3 drops.

Obs. Aromatic vinegar is used as a pungent and refreshing perfume, in faintness, &c. For this purpose it is generally dropped on a small piece of sponge placed in a stoppered bottle or a vinaigrette. It is highly corrosive, and should therefore be kept from contact with the skin and clothes.

Vinegar, Camp. *Prep.* Take of sliced garlic, 8 oz.; Cayenne pepper, soy, and walnut ketchup, of each, 4 oz.; 36 chopped anchovies; vinegar, 1 gal.; powdered cochineal, ½ oz.; macerate for a month, strain, and bottle.

Vinegar, Camphorated.

Vinegar of Cantharides. *Syn.* **BLISTERING VINEGAR**; **ACETUM CANTHARIDIS** (B. P., Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Cantharides, in powder, 2 oz.; acetic acid, 1 pint; macerate, with agitation, for 8 days, then press, and strain.

2. (Ph. E.) Cantharides, 3 oz.; euphorbium, ½ oz.; acetic acid, 5 fl. oz.; pyroligneous acid, 15 fl. oz.; macerate a week.

3. (Ph. D.) Spanish flies, 4 oz.; strong acetic acid, 4 fl. oz.; commercial acetic acid (sp. gr. 1.044), 16 fl. oz.; macerate, as before, for 14 days.

4. (B. P.) Cantharides, in powder, 2; glacial acetic acid, 2; acetic acid, (28 per cent.), 18, or a sufficiency: add the glacial acetic acid to 13 of acetic acid, and in this mixture digest the cantharides for two hours at a temperature of 200° F.; when cold, place them in a percolator, and when the liquid ceases to drop, pour over the residuum the remaining 5 of acetic acid, and when the percolation is finished, press and make the whole liquid up to 20.

Uses, &c. As a counter-irritant, and to raise blisters. For the last purpose it is applied on a piece of lint, evaporation being prevented with a piece of oiled skin or thin sheet gutta percha. The last is the best, and, indeed, the only effective form, the others being too weak. "If the acetic acid be strong, a blister will be as rapidly raised without the cantharides as with them." (Dr. A. T. Thompson.)

Vinegar, Currie. *Prep.* From currie powder, ½ lb.; vinegar, 1 gal.; infuse for a week. Used as a flavouring. Other like vinegars may be made in the same way.

Vinegar of Colchicum. *Syn.* **ACETUM COLCHICI** (Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Dried corms of colchicum or meadow saffron, 3½ drs.; dilute acetic acid, 1 pint; macerate for 3 days, then press out the liquor, and, after defecation, add to the strained liquid, proof spirit, 1½ fl. oz.

2. (Ph. E.) Fresh colchicum bulbs (dried), 1

oz.; distilled vinegar, 16 fl. oz.; proof spirit, 1 fl. oz.

3. (Ph. D.) Dried colchicum bulbs, 1 oz.; acetic acid (1·044), 4 fl. oz.; distilled water, 12 fl. oz.; as before, but prolonging the maceration for 7 days.

Obs. Vinegar of colchicum is chiefly used in gout. *Dose.* 20 drops to 1 fl. dr. The Dublin preparation is about three times as strong as the others, and the dose must therefore be proportionately less.

Vinegar, Distill'd. *Syn.* ACETUM DESTILLATUM (Ph. L. & E., and Ph. D. 1826), L. *Prep.* 1. (Ph. L.) Vinegar, 1 gal.; distil in a sand bath, 7 pints. Sp. gr. 1·0065.

2. (Ph. E.) Vinegar (preferably French), 8 parts; distil over with a gentle heat, 7 parts; and dilute the product, if necessary, with distilled water, until the sp. gr. is 1·005.

Pur., &c. "1 fluid oz. is saturated by 57 grs. of crystallised carbonate of soda." (Ph. L.) 100 grs. are saturated by 13 grs. of crystallised carbonate of soda. It contains about 4·6% of real acetic acid. If a pewter worm is used, a portion of lead is dissolved, and the product becomes cloudy and poisonous. Distilled vinegar is more agreeable than pure dilute acetic acid of the same strength.

Vinegar, Marseilles. *Syn.* VINEGAR OF THE FOUR THIEVES, PROPHYLACTIC VINEGAR; ACETUM PROPHYLACTICUM, A. ANTISEPTICUM, A. THERIACALE, A. QUATUOR FURUM, L.; VINAIGRE DES QUATRE VOLEURS, Fr. *Prep.* Take of the summits of rosemary and flowers of sage (dried), of each, 4 oz.; dried lavender flowers, 2 oz.; cloves, 1 dr.; distilled vinegar, 1 gal.; digest for 7 days, press, and filter. *Used* as a corrector of bad smells, and formerly as a prophylactic against the plague, and other contagious diseases. It is said to have been a favourite preventive with Cardinal Wolsey, who always carried some with him. The original formula also contained, of garlic, ½ oz.; fresh rue, 1½ oz.; and camphor, dissolved in spirit, 1 oz.

Vinegar of Opium. *Syn.* ACETUM OPII (Ph. E. & D.), L. *Prep.* 1. (Ph. E.) Opium, sliced, 4 oz.; distilled vinegar, 16 fl. oz.; macerate for 7 days, press, and filter.—*Dose.* 5 to 20 drops.

2. (Ph. D.) Opium, in coarse powder, 1½ oz.; dilute acetic acid, 1 pint; macerate for 7 days.—*Dose.* 10 or 12 to 60 drops.

Obs. These were intended to supersede the old 'black drop,' which they closely resemble in their action.

Vinegar, Raspberry. *Syn.* ACETUM RUBI IDEL, L.; VINAIGRE FRAMBOISE, Fr. *Prep.* 1. Bruised ripe raspberries and white wine vinegar, of each, 3 pints; macerate for 3 days, press, strain, and to each pint add of white sugar, 1 lb.; boil, skim, cool, and at once bottle. Some persons add 2 fl. oz. of brandy to each pint.

2. (P. Cod.) Fresh raspberries, picked from their calices, 3 lbs.; (1 lb.—Ph. Bor.); good

vinegar, 2 lbs.; macerate, in glass, for a fortnight, then strain, without pressure.

Obs. In a similar manner may be made cherry vinegar, strawberry v., and the vinegars of all other like fruits.

Vinegar of Squills. *Syn.* ACETUM SCILLÆ (Ph. L. E. & D.), ACETUM SCILLITICUM, L. *Prep.* 1. (Ph. L.) Take of squills, recently dried and bruised, 2½ oz.; dilute acetic acid, 1 pint; macerate with a gentle heat, in a covered vessel, for 3 days, then press out the liquor, and, after defecation, add to the strained liquid, proof spirit, 1½ fl. oz. The Edinburgh and Dublin Colleges direct cold maceration for 7 days in a glass vessel, and the Dublin omits the spirit.

2. (Wholesale.) From squills, 7 lbs.; distilled vinegar, 6 galls.; macerate in the cold for 10 days, press, and filter. Expectorant and diuretic.—*Dose.* ½ to 1½ fl. dr.; in chronic pulmonary affections, dropsies, &c.

Vinegars (Culinary). *Prep.* 1. BLACK PEPPER VINEGAR, CAPEER V., CAPSICUM V., CELERY-SEED V., CHILLIE V., CRESS-SEED V., GARLIC V., GINGER V., HORSEADISH V., ONION V., RED-ROSE V., SEVILLE-ORANGE-PEEL V., SHALLOT V., TRUFFLE V., WHITE PEPPER V., with several others of a like kind, are made by steeping about an oz. of the respective articles in a pint of good vinegar for 14 days, and straining.

2. BASIL VINEGAR, BURNET V., CELEBY V., CHERVILLE V., ELDER-FLOWER V., GREEN-MINT V., TARRAGON V., with several others from like substances, are prepared from 2 to 3 oz. of the leaves to each pint of vinegar; the whole being frequently shaken for 14 days, then strained and bottled. They are used in cookery. The culinary vinegars may also be prepared in the same manner as the 'culinary spirits' and 'tinctures,' by simply substituting strong pickling vinegar for the spirit.

Vinegars (Perfumed). *Syn.* ACETA ODORIFERA, L. *Prep.* From the dried flowers, 1 to 2 oz., or the fresh flowers, 2 to 4 oz.; strongest distilled vinegar, 1 pint; digest for a week, strain with pressure, and repeat the process with fresh flowers, if necessary. They may also be made by adding 15 to 20 drops, or q. s., of the respective essential oils to the vinegar. In a similar way are prepared the vinegars of clove-gilly flowers, elder flowers, lavender f. (vinaigre distillé de lavande), musk roses, orange flowers (fresh), Provins roses, red roses (vinaigre de rose; acetum rosatum), rosemary flowers (vinaigre de rosmarin; acetum anthosatum), tarragon flowers, &c. &c. Another excellent plan is to add 1 fl. oz. of glacial acetic acid to each pint of the respective perfumed spirits. This answers admirably for acetic eau de Cologne and like perfumes.

VINOUS FERMENTATION. *Syn.* ALCOHOLIC FERMENTATION. The peculiar change by which sugar, in solution, is converted into carbonic acid, which is eliminated, and into alcohol, which remains in solution in the fermented liquor.

The presence of a 'ferment' is essential to excite the vinous fermentation, as a solution of absolutely pure sugar remains unaltered, even though exposed to the conditions most favourable to its accession. In the juices of the sweet fruits, and in those vegetable solutions that spontaneously run into a state of fermentation, the ferment is supplied by nature, and is intimately associated with the saccharine matter. In the juice of those grapes which produce the more perfect wines, the relative proportions of the exciters of fermentation and the sugar are so accurately apportioned, that the whole of the former are decomposed, and nearly the whole of the latter is converted into alcohol; so that the liquid (wine) is left in a state but little liable to future change. An infusion of malt, however, in which the nitrogenised matters (gluten, vegetable albumen, &c.) are absent, or at least present in too small quantities to vigorously excite the vinous fermentation, undergoes a mixed species of decomposition, with the formation of products widely different from those that result from the true vinous fermentation; or, in other words, the liquid becomes spoiled. But if a ferment (yeast) be added to this infusion of malt under the above circumstances, and in the proper proportion to the sugar present, the true vinous fermentation speedily commences, and the liquid becomes converted into beer. This is what actually takes place in the process of brewing, and the scientific brewer endeavours to employ a proper quantity of ferment to decompose the whole of the saccharine matter of his wort; but, at the same time, as equally endeavours to avoid the use of an excess.

The chief product of the vinous fermentation is alcohol, but there are other substances simultaneously produced, and which remain associated with the fermented liquor. Among the principal of these are *oenanthic acid*, *oentanthic ether*, *fusel oil* (oil of potato spirit, oil of grain), &c.; none of which exist previously to fermentation, and are generally supposed to result from the action of the nitrogenised matters of the solution on the sugar. Under certain circumstances these extraneous products are formed in much larger quantities than under others; and as these substances injure the value of the alcohol with which they are associated, a knowledge of the peculiar circumstances favourable and unfavourable to their production is a desideratum to the brewer and distiller.

According to MM. Colin and Thénard, Frémy, Rousseau, and others, the essential condition of a ferment, to be able to excite the pure vinous fermentation, is to be sufficiently acidulous to act on coloured test-paper; and this acidity should arise from the presence of certain vegetable acids and salts, capable of conversion into carbonic acid and carbonates by their spontaneous decomposition. Those acids and salts which are found to pre-exist in

fermentable fruits and liquors, as the tartaric, citric, malic, and lactic acids, and their salts, should be chosen for this purpose; preference being given to the bitartrate of potassa, on account of its presence in the grape. The addition of any of these substances to a saccharine solution renders its fermentation both more active and complete. The favourable influence of cream of tartar on fermentation was first pointed out by Thénard and Colin, and the addition of a little of this article has been adopted in practice, with manifest advantage, by the manufacturers of British wine.

There is good reason for supposing that each variety of sugar which is susceptible of the alcoholic fermentation is first converted into grape sugar, by contact with the ferment, and that this variety of sugar is alone capable of yielding carbonic acid and alcohol.

The circumstances most favourable to this fermentation are, a certain degree of warmth—a sufficient quantity of active ferment, and its due distribution through the liquor. The temperature of from 68° to 77° Fahr. is usually regarded as the most propitious for the commencement and progress of fermentation; but it has been ably shown by Liebig that, at this temperature, the newly formed alcohol slowly undergoes the 'acetous fermentation,' forming vinegar, by which the vinous character of the liquor is lessened. This conversion of alcohol into vinegar proceeds most rapidly at a temperature of 95° Fahr., and gradually becomes more languid, until, at about 46° to 50° Fahr. (8 to 10 Cent.), it ceases altogether, while the tendency of the nitrogenous substances to absorb oxygen at this low temperature is scarcely diminished in a perceptible degree. "It is therefore evident that if wort (or any other saccharine solution) is fermented in wide, open, shallow vessels, as is done in Bavaria, which afford free and unlimited access to the atmospheric oxygen, and this in a situation where the temperature does not exceed 46° to 50° Fahr., a separation of the nitrogenous constituents, *i. e.* the exciters of acidification, takes place simultaneously on the surface, and within the whole body of the liquid." (Liebig.) By this method wine or beer is obtained, which is invariably far superior in quality to that fermented in the usual manner. See FERMENTATION.

The symptoms of a perfect fermentation of malt wort, according to the usual English system with top yeast (*oberhefe*), have been thus described by a well-known practical writer on brewing: 1. A cream-like substance forms round the edges of the gyle tun, which gradually extends itself, and ultimately covers the whole surface of the liquor.—2. A fine curly or cauliflower head in a similar way extends itself over the surface, and indicates to the experienced brewer the probable quality of the fermentation.—3. The 'stomach,' or vinous odour, is next evolved, and continues to increase with the attenuation of the wort.

The peculiar nature of this odour is also an indication of the state of the fermentation.—4. The cauliflower head changes, or rises to a fine 'rocky' or 'yeasty' head, and ultimately falls down.—5. In this stage the head assumes a peculiar yeasty appearance, called by brewers 'close-yeasty,' and the gas is evolved in sufficient quantity to blow up little bells or bubbles, which immediately burst, and are followed by others, at intervals depending on the activity and forwardness of the fermentation. These bells should be bright and clear; as, if they appear opaque or dirty, there is something the matter with the wort. (Black.)

It is often of the utmost importance to brewers, wine-merchants, sugar-refiners, druggists, &c., to be able to lessen the activity of the vinous fermentation, or to stop it altogether, or to prevent its accession to syrups and other saccharine and vegetable solutions. Whatever will still the motion of the molecules of the nitrogenous matter forming the ferment will render them inoperative as exciters of fermentation. Among the simplest means of effecting this object, and such as admit of easy practical application, may be mentioned exposure to either cold or heat. At a temperature below about 50° Fahr., the acetous fermentation is suspended, and the alcoholic fermentation proceeds with diminished activity as the temperature falls, until at about 38° Fahr. it ceases altogether. In like manner, the rapid increase of the temperature of a fermenting liquid arrests its fermentation, and is preferable to the action of cold, as it is of easier application, and perfectly precipitates the ferment in an inert state. For this purpose, a heat of about 180° Fahr. is sufficient; but even that of boiling water may be employed with advantage. In practice, fluids are commonly raised to their boiling-point for this purpose, or they are submitted to the heat of a water bath (207½° Fahr.). In this way the fermentation of syrups and vegetable solutions and juices is commonly arrested in the pharmaceutical laboratory.

Among substances that may be added to liquids to arrest fermentation, the most active are—the volatile oil of mustard, coarsely powdered mustard seed or pure flour of mustard, sulphurous acid or the fumes of burning sulphur, sulphuric acid, sulphite of lime, tincture of catechu, strong spirit, strong acetic acid, chlorate of potassa, sugar of milk, bruised horseradish, garlic, and cloves, and their essential oils, and all the other volatile oils that contain sulphur, and most of the salts that readily part with their oxygen. These substances arrest fermentation by rendering the yeast inoperative, and they possess this power nearly in the order in which they stand above. In practice, mustard, the fumes of burning sulphur, sulphite of lime, and chlorate of potassa, are those most adapted for beer, cider, wines, syrups, &c.; but some of the others are occasionally used, though less active. For arrest-

ing or preventing the fermentation of the vegetable juices and solutions, and the medicated syrups employed in pharmacy, mustard seed, either alone or combined with a little bruised cloves, may be safely used, as the addition of acids or salts would lead to the decomposition of their active principles. For this reason such liquids should be kept in a sufficiently low temperature to prevent fermentation; and should they pass into that state, it should be preferably arrested by the application of heat or cold, as above explained. Sugar of milk is also very effective for certain syrups, if not all of them.

To prevent, or rather to lessen, the production of fusel oil, it has been proposed to add a certain quantity of tartaric acid or bitartrate of potassa to the wort; or, to arrest the fermentative process somewhat before the liquid has reached its utmost degree of attenuation. The best means of depriving the spirit of this and other substances of a similar nature is to largely dilute it with water, and to redistill it at a gentle heat. Agitation with olive oil, decantation, dilution with a large quantity of water, and redistillation, have also been recommended. An excellent method is filtration through newly burnt and coarsely powdered charcoal. This plan succeeds perfectly with moderately diluted spirit. On the Continent, the addition of about 10% of common vinegar, and a very little sulphuric acid, followed by agitation, repose for a few days, and redistillation, is a favourite method. A solution of chloride of lime is also employed for the same purpose, and in the same way. In both these cases a species of ether is formed, which possesses a very agreeable odour. In the first, acetate of oxide of amyl (essence of jargonelle) is produced; and in the other, chloride of amyl, which also possesses a pleasant ethereal smell and taste. The affinity of the hydrated oxide of amyl (fusel-oil) for acetic acid is so great, that they readily unite without the intervention of a mineral acid. (Doehereiner.) Thus, the oil of vitriol mentioned above, though always used in practice, might be omitted without any disadvantage.

According to Messrs. Bowerbank, the distillers, quoted by Dr. Pereira, 500 galls. of corn spirit yield about one gal. of corn-spirit oil. See ACETIFICATION, ALCOHOL, BREWING, DISTILLATION, FERMENTATION, FUSEL OIL, SPIRIT, VINEGAR, VISCOUS FERMENTATION, YEAST, &c.

VIOLET. *Syn.* PURPLE VIOLET, SWEET V.; *VIOLA* (Ph. L. & E.), L. "The recent petals of *Viola odorata*, Linn." (Ph. L.) It is chiefly used on account of its colour. See STYRUP.

VIOLET DYE. Violet, like purple, is produced by a mixture of red and blue colouring matter, applied either together or in succession. The 'aniline colours' are now almost exclusively used for obtaining violet on silk and wool (see ANILINE PURPLE & TAE COLOURS). With the old dye-stuffs, violet may thus be

obtained:—A good violet may be given to silk or wool by passing it first through a solution of verdigris, then through a decoction of logwood, and, lastly, through alum water. A fast violet may be given by first dyeing the goods a crimson with cochineal, without alum or tartar, and, after rinsing, passing them through the indigo vat.—Linsens and cottons are first galled with about 18½ of gall-nuts, next passed through a mixed mordant of alum, iron liquor, and sulphate of copper, working them well, then through a madder bath made with an equal weight of root, and, lastly, brightened with soap or soda. Another good method is to pass cloth, previously dyed Turkey red, through the blue vat. Wool, silk, cotton, or linen, mordanted with alum and dyed in a logwood bath, or a mixed bath of archil and Brazil, takes a pretty, but false, violet.

VISCOUS FERMENTATION. *Syn.* MUCILAGINOUS FERMENTATION, MUCOUS F. The peculiar change by which sugar, in solution, is converted into gummy matters, and other products, instead of into alcohol.

When the expressed juice of the beet is exposed to a temperature of 90° to 100° Fahr., for a considerable time, the sugar it contains suffers this peculiar kind of fermentation. Gases are evolved which are rich in hydrogen, instead of being exclusively carbonic acid, and when the sugar has, for the most part, disappeared, mere traces of alcohol are found in the liquid, but, in place of that substance, a quantity of lactic acid, mannite, and a mucilaginous substance, resembling gum arabic, and said to be identical with gum in composition. By boiling yeast or the gluten of wheat in water, dissolving sugar in the filtered solution, and exposing it to a tolerably high temperature, the viscous fermentation is set up, and a large quantity of the gummy principle generated, along with a ferment of a globular texture, like that of yeast, but which is capable of producing only the viscous fermentation in saccharine solutions.

The peculiar cloudy, stringy, oily appearance of wine and beer, called by the French 'graisse,' and the English 'ropiness,' depends on the accession of the viscous fermentation. The mineral acids and astringent substances, especially the sulphuric and sulphurous acids, and tannin, precipitate the viscous ferment, and are, hence, the best cures for this malady of fermented liquors. It is the large amount of tannic acid in the red wines and well-hopped beer which is the cause of their never being attacked with 'graisse,' or 'ropiness.' See **VINOUS FERMENTATION, WINES, &c.**

VISION. The following means of preserving and restoring the sight may be appropriately inserted here:—

For **NEAR-SIGHTEDNESS.**—Close the eyes and press the fingers very gently, from the nose outward, across the eyes. This flattens the pupil, and thus lengthens or extends the angle of vision. This should be done several

times a day, or at least always after washing the face, until short-sightedness is overcome.

For **LOSS OF SIGHT BY AGE**, such as require magnifying glasses, pass the fingers or towel from the outer corner of the eyes inwardly, above and below the eyeballs, pressing very gently against them. This rounds them up, and preserves or restores the sight.

It is said that many persons, by this last means, have preserved their sight so as to read fine print at 80 years of age; others, whose sight had been impaired by age, by carefully manipulating the eyes with their fingers, from their external angles inwardly, have restored their sight, and been able to dispense with glasses, and have since preserved it by a continuance of the practice. To be successful, or safe, these practices must be applied with great gentleness and caution. Many persons seriously damage their eyes by forcibly rubbing them when drowsy, especially on awaking in the morning.

The 'Lancet' remarks, that "there is good reason to believe that chicory (the coffee of the Londoners), from its narcotic character, exerts an injurious effect on the nervous system. So convinced of this is Professor Beer, of Vienna, a most celebrated German oculist, that he has enumerated chicoried coffee among the causes of amaurotic blindness."

To strengthen the eyes, to relieve them when swollen or congested, and to remove chronic ophthalmia, purulent discharges, &c., nothing is equal to frequently bathing them with water, at first tepid, but afterwards lowered in temperature to absolute coldness.

VITRIOL. A common name for sulphuric acid and for several of its salts. (See *below*.)

Vitriol, Blue. *Syn.* ROMAN VITRIOL. Commercial sulphate of copper.

Vitriol, Green. Commercial sulphate of iron.

Vitriol, White. Commercial sulphate of zinc.

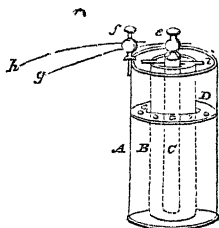

VITILE VAYR. *Syn.* VETIVER. The Tamil name of the odorous and fibrous roots of the *Andropogon muricatus* sold by the perfumers.

VOLTAIC ELECTRICITY. *Syn.* GALVANIC E., GALVANISM, VOLTAISM. That branch of electrical science which has reference to the phenomena attendant on the development of electricity by chemical action. Electricity thus developed may be made to show itself in the 'static' condition, so as to produce the effects of frictional electricity, but it is much more easily obtained in the 'dynamic' condition—in other words, as a 'voltaic current'—when it is especially remarkable for its chemical and magnetic effects. If a plate of zinc and a plate of platinum be immersed in dilute sulphuric acid, and connected outside the liquid by a wire, a current of electricity will immediately be set up, and will continue as long as the conducting circuit is complete and the action of the acid on the zinc goes on. The current of 'positive' electricity passes from the zinc, through the liquid, to the

platinum, and thence through the wire to the zinc. The arrangement of two dissimilar metals immersed in a liquid which acts upon one of them is called a voltaic couple. By uniting a number of couples together in regular order, a voltaic pile or battery is formed.

The older forms of the voltaic battery, viz., VOLTA'S PILE, CRUIKSHANK'S TROUGH, and WOLLASTON'S BATTERY, are now but little used. They all consist of a series of couples of zinc and copper, excited by an acid liquid, generally a mixture of water with $\frac{1}{10}$ of its bulk of sulphuric acid, and $\frac{1}{10}$ of nitric acid.

One of the most useful forms of the voltaic battery is that proposed by the late Prof. Daniell, and commonly known by his name. Its peculiar advantages arise from its action continuing without interruption for a long time, hence the name of 'constant battery' that has been applied to it. The following figure will explain the construction of each couple.

- A. A copper cylinder, filled with a saturated solution of sulphate of copper.
- B. A smaller porous cylinder (earthenware or membrane), containing a mixture of 1 measure of strong sulphuric acid, and about 8 measures of water.
- C. A rod of amalgamated zinc, supported in the smaller cylinder by the cross piece (i).
- D. A shelf full of small holes, for supporting crystals of sulphate of copper, to keep up the strength of the solution.
- e and f. Screws and caps to connect the wires g and h with the battery.
- g. The negative wire, connected with the zinc.
- h. The positive wire, connected with the copper.

One of these couples is sufficient for electrotyping; six of them form a circle of considerable power, and about 20 produce one sufficiently strong for most experiments of demonstration and research.

In arranging these, as well as other batteries, when intensity, or travelling power, is desired, the metallic communication is made between the opposite metals (the zinc of one couple being united with the copper of another); but when simple quantity without intensity is required, the zinc of one battery is united with the zinc of the other, and the copper of the one with the copper of the other, an effect which is equally attainable with a single battery of enlarged dimensions.

Another useful apparatus is GROVE'S BATTERY, in which the positive metal consists of amalgamated zinc immersed in sulphuric acid, diluted with 10 times its bulk of water; and the negative metal of platinum immersed in strong nitric acid. The two liquids are kept

separate by the use of porous vessels, as in 'Daniell's battery.' This is an extremely powerful arrangement, but not so constant as Daniell's, owing to the reduction of the nitric acid to lower oxides of nitrogen. After this battery has been in action for about an hour, copious red nitrous fumes are given off, which cause great annoyance.

In place of platinum, compact charcoal or coke, prepared by a rather troublesome process, may be used, and the arrangement then constitutes a BUNSEN'S BATTERY. Other substitutes for the costly platinum have been proposed, as lead coated with gold or platinum, and iron rendered 'passive' by immersion in strong nitric acid. Callan has obtained very good results with amalgamated zinc and cast iron immersed in diluted sulphuric acid, without the use of nitric acid (MAXNOUTH BATTERY).

In SMEE'S BATTERY, which is much used in the arts, pairs of amalgamated zinc and platinised silver (or platinised platinum) are immersed in dilute sulphuric acid (1 part acid to 7 parts water). The plates of zinc are usually bent double, and the platinised plates interposed between the two surfaces formed by the bend. See PLATINIZING (page 1099).

In every voltaic combination the passage of the electricity (*i.e.* the positive modification of the force) in the liquid is from the active element to the inactive element; in the case of a simple zinc-and-copper couple, for instance, it is from the zinc to the copper. If this simple fact be borne in mind, it will decide in every case the question which confuses so many, namely, which is the positive, and which the negative end of a battery? The positive is the end where the electricity leaves the battery; the negative where it re-enters it. For further information connected with the subject of voltaic electricity, see articles on ELECTRICITY, ELECTROLYSIS, ELECTROTYPE, ETCHING, &c.

VOLUMETRIC ANALYSIS. Quantitative chemical analysis by measure. This method of analysis "consists in submitting the substance to be estimated to certain characteristic reactions, employing for such reactions liquids of known strength, and from the quantity of the liquid employed determining the weight of the substance to be estimated by means of the known laws of equivalence." As an example of this method we give the following from the Introduction in Mr. Sutton's excellent 'Handbook of Volumetric Analysis':—"Suppose that it is desirable to know the quantity of pure silver contained in a shilling. The coin is first dissolved in nitric acid, by which means a bluish solution, containing silver, copper, and probably other metals, is obtained. It is a known fact that chlorine combines with silver in the presence of other metals to form chloride of silver, which is insoluble in nitric acid. The proportions in which the combination takes place are 35.46 of chlorine to every 108 of silver; conse-

quently, if a standard solution of pure chloride of sodium is prepared by dissolving 58·46 grains of the salt (*i. e.* 1 equiv. sodium = 23, 1 eq. chlorine = 35·46 = 1 eq. chloride of sodium 58·46) in so much distilled water as will make up exactly 1000 grains by measure; every single grain of this solution will combine with ·108 grain of pure silver to form chloride of silver, which precipitates to the bottom of the vessel in which the mixture is made. In the process of adding the salt solution to the silver, drop by drop, a point is at last reached when the precipitate ceases to form. Here the process must stop. On looking carefully at the graduated vessel from which the standard solution has been used, the operator sees at once the number of grains which have been necessary to produce the complete decomposition. For example, suppose the quantity used was 520 grains; all that is necessary to be done is to multiply ·108 grain by 520, which shows the amount of pure silver present to be 56·16 grains." The volumetric method is much less troublesome than the ordinary method of analysis (by separating the constituents of a mixture and weighing them), and is admirably adapted for the examination of substances used in arts and manufactures. Most of the processes described under ACIDIMETRY and ALKALIMETRY are examples of this method. See those articles, also EQUIVALENTS, TEST-SOLUTIONS, &c.

WADE'S DROPS. Compound tincture of benzoïn.

WAFER PAPER. See WAFERS, in Cookery (*below*).

WAFERS. Thin adhesive discs, used for securing letters or sticking papers together.

Prep. 1. (WAFERS, FLOUR W.) The finest wheaten flour is mixed with water, either pure or coloured, to a smooth pap or batter, which, after being passed through a sieve, to remove clots or lumps, is poured into the 'wafer-irons' (previously warmed and greased with butter or olive oil), and in this state exposed to the heat of a clear charcoal fire; the whole is then allowed to cool, when the irons are opened, and the thin cake, which has become hard and brittle, is cut into wafers by means of sharp annular steel punches, made exclusively for the purpose.

2. (GELATINE WAFERS, TRANSPARENT W.) Good gelatine or glue is dissolved, by the heat of a water bath, in just sufficient water to form a consistent mass on cooling; it is then poured, whilst hot, upon the surface of a warm plate or mirror glass, slightly oiled, and surrounded with a border of card paper (laid flat); a similar plate, also warmed and oiled, is next laid upon the gelatine, and the two plates pressed into as close contact as is permitted by the card paper; when quite cold, the thin sheet of gelatine is removed, and cut into wafers with punches, as before. 1 to 2 oz. of sugar is commonly added to each lb. of gelatine.

3. (MEDALLION WAFERS.) A sheet of mettis or glass, having designs sunk in it corresponding to the raised part of seals, being provided, the hollows are filled up with a mixture formed of any appropriate coloured powder, made into a paste with gum water or size, leaving the flat part clear; melted coloured glue is then poured on the plate, and the process is otherwise conducted as before. For use, the paper is wetted where the wafer is to be applied.

Obs. Care must be taken that no poisonous colours be employed. For gelatine wafers, transparent colours only can be used. Those noticed under LIQUEURS and STAINS (Confectioner's) are appropriate. To these may be added plumbago, sesquioxide of iron (crocus martis), smalts, levigated vegetable charcoal, and vermillion.

Wafers. (In cookery.) *Prep.* Make fine flour, dried and sifted, into a smooth thin batter with good milk, or a little cream-and-water; add about as much white wine as will make it thick enough for pancakes, sweeten it with a little loaf sugar, and flavour it with powdered cinnamon. When thus prepared, have the wafer-irons made ready, by being heated over a charcoal fire; rub them with a piece of linen cloth dipped in butter; then pour a spoonful of the batter upon them, and close them almost immediately; turn them upon the fire, and pare the edges with a knife, if any of the batter oozes out. A short time will bake them, when the irons are perfectly heated. The wafers must be curled round whilst warm when they are for ornaments. 'Wafer paper' is prepared in a similar way to the above; but when intended to be kept for some time, the milk must be omitted. Used by cooks, &c.; and, recently, as an envelope for nauseous medicines.

Wafers, Da Silva's. These nostrums were introduced to the public some time ago, as though they were prepared from the formulæ of a celebrated physician whose name was affixed to them.¹ There are three varieties, which are said to be prepared as follows:—

1. **APERIENT or ANTIBILIOUS WAFERS.** From sugar and extract of liquorice (Spanish juice), equal parts; senna and jalap, of each, in fine powder, about $\frac{1}{2}$ dr. to every oz. of sugar employed; made into a mass with a concentrated infusion of senna, and divided into 12 gr. lozenges or squares with the corners rounded off.

2. **FEMALE WAFERS.** From sugar, horehound candy (or honey), and aperient wafer mass, equal parts; beaten to a proper consistence with weak gum water, to which a little orange-flower water has been added, and divided into 8 gr. tabellæ, as before.

3. **PULMONIC WAFERS.** From lump sugar and starch, of each, in powder, 2 parts; powdered gum, 1 part; made into a lozenge-mass

¹ For an exposition of the Da Silva quackery, with Dr. Locock's letter on the subject, see the 'Anat. of Quackery,' or the 'Med. Cir.," ii, 106-126.

with vinegar of squills, oxymel of squills, and ipecacuanha wine, equal parts, gently evaporated to 1-6th their weight, with the addition of lactucarium in the proportion of 20 to 30 grs. to every oz. of the dry powders; the mass being divided into half-inch squares, weighing about $7\frac{1}{2}$ grs. each (when dry), as before.

WALNUT. The *Juglans regia*, a tree of the natural order *Juglandaceae*. The sap yields sugar; the fruit is the walnut; the kernels of the latter are eaten and pressed for their oil; the peel or husks are used for 'rooting' or dyeing brown; the unripe fruit is pickled, and its juice is used as a hair dye; the leaves are reputed diaphoretic and antisyphilitic; and the wood is esteemed for cabinet work.

WARBURG'S FEVER DROPS. See **WARBURG'S FEVER TINCTURE**.

WARD'S RED DROP. A strong solution of emetic tartar in wine.

WARTS. *Syn.* **VERRUCÆ**, L. These chiefly attack the hands, and may be removed by the daily use of a little nitrate of silver, nitric acid, or aromatic vinegar, as directed under **CORN**. The first of the above applications produces a black stain, and the second a yellow one; both of which, however, wear off after the lapse of some days. Acetic acid scarcely discolours the skin. Erasmus Wilson, the eminent surgeon and talented author of several works on the skin, mentions the case of a gentleman who removed an entire crop of warts from his knuckles and fingers by subjecting them to a succession of sparks from one of the poles of an electrical machine. "He was in the habit, as is usual, of trying the amount of electric fluid collected in his machine by placing his knuckle near the brass knob, and receiving a spark. Observing that an odd sensation was produced whenever the spark struck a wart, he was tempted for amusement to give them a round of discharges. When his attention was next directed to his hands, he found, to his surprise and satisfaction, that all the warts had disappeared." Dr. Peetz, of Wiesbaden, recommends the internal use of carbonate of magnesia in cases of warts.

The papular eruption which covers the hands of some persons, and which is occasionally called 'soft warts,' is best removed by the daily use of Gowland's lotion.

WASH. The fermented wort of the distiller.

WASH-BALLS. See **SAVONNETTES**.

WASHERWOMAN'S SCALL. See **PSORIASIS**.

WASHES. The familiar name of lotions, more especially of those employed as cosmetics. See **FRECKLES**, **LOTION**, **MILK OF ROSES**, **SKIN COSMETICS**, &c., and *below*.

Washes, Hair. *Prep.* 1. From rosemary tops, 2 oz.; boiling water, 1 pint; infused together in a teapot or jug, either with or without the addition of rectified spirit, 1 fl. oz. (or rum, 2 fl. oz.) to the cold strained liquor.

2. Box leaves, a small handful; boiling water,

1 pint; digest for an hour, simmer 10 minutes, and strain. Both are used to improve the growth of and strengthen the hair.

3. To clean the 'partings,' remove scurf, &c.—*a.* (**ANTIPITYRIENNE**.) From sesquicarbonate of ammonia, 1 oz.; spirit of rosemary, $\frac{1}{2}$ pint; rose of elder-flower water, $1\frac{1}{2}$ pint.

b. (**DETERGENT ESSENCE**.) From honey, 2 oz.; borax, 1 oz.; cochineal (bruised), $\frac{1}{4}$ oz.; camphor, 1 dr.; (dissolved in) rectified spirit, 2 fl. oz.; soft water, $\frac{3}{4}$ pint; oil of rosemary, 20 drops.

c. (**VEGETABLE EXTRACT**) Take of salt of tartar, 1 oz.; rosemary water, 1 pint; burnt sugar, q. s. to tinge it brown; dissolve, filter, and add of essence of musk, 10 drops.

4. To darken the hair.—*a.* From pyrogallie acid, $\frac{1}{4}$ oz.; distilled water, orange-flower water, and rectified spirit, of each, $1\frac{1}{4}$ fl. oz.

b. (**LA FOREST'S COSMETIC LOTION** or **LIQUID HAIR DYE**.) Boil, for a few minutes, chloride of sodium, 1 gr., and sulphate of iron, 2 drs., in red wine, 1 lb.; then add of verdigris, 1 dr.; in 2 or 3 minutes remove it from the fire, and further add of powdered galls, 2 drs.; the next day filter. For use, moisten the hair with the liquid; in a few minutes dry it with a cloth, and afterwards wash the skin with water.

5. To prevent the hair falling off.—*a.* (**AMERICAN SHAMPOO LIQUID**.) Take of carbonate of ammonia, $\frac{1}{2}$ oz.; carbonate of potash, 1 oz.; water, 1 pint; dissolve, and add the solution to a mixture of tincture of cantharides, 5 fl. oz.; rectified spirit, 1 pint; good rum, 3 quarts. Used to strengthen the hair and to remove dandruff, by moistening it with the mixture, rubbing, so as to form a lather, and then washing with cold water.

b. (**BALM OF COLUMBIA**.) As the last, omitting the potash, quadrupling the carbonate of ammonia, and adding some perfume.

c. (**Eras. Wilson's Eau de Cologne** (strongest), 8 fl. oz.; tincture of cantharides, 1 fl. oz.; oils of rosemary and lavender, of each, $\frac{1}{2}$ fl. dr.

d. (**DR. LOCOCK'S LOTION**.) From expressed oil of mace (nutmeg), 1 oz.—liquefied, at a gentle heat, with olive oil, $\frac{1}{2}$ oz.; and, when cold, formed into an emulsion by agitation with rose water, $\frac{1}{2}$ pint; spirit of rosemary, 2 $\frac{1}{2}$ fl. oz.; stronger liquor of ammonia, $1\frac{1}{2}$ fl. drs. For other formulæ, see **BALDNESS**, **HAIR DYES**, **LOTION**, &c.

Washes, Medicinal. See **LOTION**, &c.

Washes, Mouth. *Syn.* **TQOTH WASHES**; **COLLUTORIA**, L. *Prep.* 1. Take of camphor (cut small), $\frac{1}{4}$ oz.; rectified spirit, 2 fl. oz.; dissolve. A few drops to be added to a wine-glassful of water, to sweeten the breath and preserve the teeth.

2. Chloride of lime, $\frac{1}{2}$ oz.; water, 2 fl. oz.; agitate well together in a phial for $\frac{1}{2}$ an hour, filter, and add, of rectified spirit, 2 fl. oz.; rose or orange-flower water, 1 fl. oz. Used, highly diluted with water, as the last, by smokers and persons having a foul breath.

3. Mastic^c (in powder), 2 drs.; balsam of Peru, $\frac{1}{2}$ dr.; gum, 2 drs., or q. s.; orange-flower water, 6 fl. oz.; tincture of myrrh, 2 fl. drs.; for an emulsion. In loose teeth, &c.

4. Tannin, $\frac{1}{2}$ dr.; tincture of tolu, 2 fl. drs.; tincture of myrrh, 6 fl. drs.; spirit of horse-radish, 2 fl. oz.; mix. In spongy gums, scurvy, &c.; diluted with tepid water.

5. (Swediaur.) Borax, $\frac{1}{2}$ oz.; water and tincture of myrrh, of each, 1 fl. oz.; honey of roses, 2 oz. In tender or ulcerated gums.

6. Balsam of Peru, 2 drs.; camphor, $\frac{1}{2}$ dr.; essence of musk and liquor of ammonia, of each, $\frac{1}{2}$ fl. dr.; tincture of myrrh, 3 fl. drs.; spirit of horseradish, 1 $\frac{1}{2}$ fl. oz. To sweeten and perfume the breath; a teaspoonful in $\frac{1}{2}$ wineglassful of tepid water to rinse the mouth with.

Washes, Tooth. See *above*.

WASHING FLUIDS. Solutions of carbonate of soda, rendered caustic with quicklime.

WASHING POWDERS. See **POWDERS**.

WATCHFULNESS. *Syn.* **SLEEPLESSNESS**; **AGRYPNIA** L. The common causes of watchfulness are thoughtfulness or grief, disordered stomach or bowels, heavy and late suppers, and a deficiency of out-door exercise. The best treatment, in ordinary cases, simply consists in an attention to these points. The method of producing sleep recommended by a late celebrated hypnotist consists in merely adopting an easy recumbent position, inclining the head toward the chest, shutting the eyes, and taking several deep inspirations with the mouth closed. Another method, recommended by an eminent surgeon, and which appears infallible if persevered in with proper confidence, and which is suitable either to the sitting or recumbent posture, consists in tying a decanter cork with a bright metallic top, a pencil-case, or any other bright object on the forehead, in such a position that the eyes must be distorted or strained to be capable of seeing it. By resolutely gazing in this way for a short time, without winking, with the mind fully absorbed in the effort, the muscles of the eyes gradually relax, and the experimenter falls asleep. Gazing in a similar manner on any imaginary bright spot in the dark, as at night, exerts a like effect. A tumblerful of cold spring water, either with or without a few grains of bicarbonate of potash in it, taken just before lying down, will frequently succeed with the dyspeptic and nervous, when all other means fail. See **SUPPER**, &c.

WATER. H_2O . *Syn.* **OXIDE OF HYDROGEN**, **PROTOXIDE OF H.**; **AQUA**, L.; **EAU**, Fr.; **WASSER**, Ger. The ancients regarded water as a simple substance, and as convertible into various mineral and organic products. Earth, air, fire, and water, were at one time conceived to be the elementary principles or essences of matter, from which all form and substance derived their existence. The true constitution of water was not discovered until about the

year 1781, when Cavendish and James Watt, independently and nearly simultaneously, showed it to be a compound of hydrogen and oxygen. Five years, however, before this time (1776), the celebrated Macquer, assisted by Sigaud de la Fond, obtained pure water by the combustion of hydrogen in the air. It has since been satisfactorily demonstrated that hydrogen and oxygen exist in water in the proportion of 1 to 8 by weight, or 2 to 1 by volume; the sp. gr. of hydrogen being to that of oxygen as 1 to 16. One cubic inch of perfectly pure water at 62° Fahr., and 30 inches of the barometer, weighs 252.458 grs.; by which it will be seen that it is 815 times heavier than atmospheric air. Its sp. gr. is 1.0, it being made the standard by which the densities of all solid and liquid bodies are estimated. The sp. gr. of frozen water (ice) is .9175 water being 1.0 (Dufour); that of aqueous vapour (steam), .6252, air being 1.0. Water changes its volume with the temperature; its greatest density is at about 39 $\frac{1}{2}$ ° Fahr., and its sp. gr. decreases from that point, either way. By the enormous pressure of 30,000 lbs. on the square inch, 14 volumes of water are condensed into 13 volumes. Water evaporates, at all temperatures, but at 212°, under ordinary circumstances, this takes place so rapidly that it boils, and is converted into vapour (steam), whose bulk is nearly 1700 times greater than that of water. The general properties and uses of water are too well known to require notice.

Var. Of these the following are the principal:—

DISTILLED WATER; **AQUA DESTILLATA** (B. P., Ph. L. E. & D.), L. Obtained by the distillation of common water through a block-tin worm, rejecting the first and last portions that come over. The still employed for this operation should be used for no other purpose; and when great nicety is required the distillation should be performed in glass or earthenware. It remains limpid on the addition of lime water, chloride of barium, nitrate of silver, oxalate of ammonium, or hydrosulphuric acid. It is the only kind of water that should be employed in chemical and pharmaceutical operations. When distilled water is not at hand, clean filtered or clarified rain water is the only kind that can be successfully substituted.

RAIN WATER; **AQUA PLUVIA**, L. A nearly pure kind of natural water; but it contains minute quantities of air, carbonic and nitric acid, carbonate of ammonium, &c.

SNOW WATER; **AQUA NIVALIS**, L. The purest of all natural waters.

SPRING WATER; **AQUA** (Ph. E.), **AQUA FONTANA** (Ph. D.), L. Rain water which has percolated through the earth almost always contains mineral impurities. For pharmaceutical use, spring water must be so far free of saline matter as not to possess the quality of hardness, or contain above 1/6000th part of solid matter. (Ph. E.)

RIVER WATER; AQUA FLUVIALIS, L. Less pure than good spring water. Thames water contains about 1·3500th part of fixed impurities, chiefly carbonate of calcium; or from 16 to 24 grs. of solid matter per gallon, independently of gaseous matter and mechanical impurities.

WELL WATER, PUMP WATER; AQUA PUTREANA, L. Less pure than either of the preceding. Usually contains a large quantity of carbonate and sulphate of calcium. Hence its 'Hardness' and property of curdling soap. When this arises from the first-named substance, it is called, temporary hardness, since it is, for the most part, removed by boiling and exposure; but when it arises from sulphate of calcium, it is called 'permanent hardness,' since it cannot be so easily remedied.

SEA WATER; AQUA MARINA, L. The characteristic of this variety is its saltiness. Its density is about 1·0274, and the average quantity of saline matter which it contains is about $3\frac{1}{2}$ per cent., of which about $\frac{2}{3}$ are chloride of sodium, and the remainder chiefly chloride of magnesium and sulphate of magnesium.

Analysis of Sea Water (British Channel), by Dr. Schweitzer, of Brighton:

1000 grains contained—	grains.
Water	964·745
Chloride of sodium	27·059
" of potassium	0·766
" of magnesium	3·666
Bromide of magnesium	0·029
Sulphate of magnesium	2·296
" of calcium	1·406
Carbonate of calcium	0·083
	1000·

Pur. Pure water is perfectly transparent, odourless, and colourless, and evaporates without residue, or even leaving a stain behind. The purest natural water is that obtained by melting snow or frozen rain, that has fallen at some distance from any town. Absolutely pure water can only be obtained by the union of its gaseous constituents; but very pure water, sufficiently so for all purposes, may be procured by the careful distillation of common water.

Tests. 1. If a precipitate is formed, or a 'fur' or 'crust' deposited on the vessel during ebullition, it indicates the presence of carbonate of calcium.—2. The residuum, if any, of evaporation, is impurity; if it be organic matter, smoke and a peculiar odour will be evolved, as the residue becomes dry and charred.—3. If a solution of ferrous sulphate, when added to the water contained in a stoppered phial, occasions a reddish-brown precipitate after a few days, the presence of oxygen is indicated.—4. Neither litmus, syrup of violets, nor turmeric, are discoloured or affected when moistened with pure water; if the first two are reddened, it indicates an acid; if the

last is turned brown, an alkali.—5. If a milkiness follows the addition of a solution of hydrate of calcium before and not after the water has been boiled, it contains carbonic acid.—6. Chloride of barium occasions a white precipitate, insoluble in nitric acid if sulphuric acid or sulphates be present.—7. Oxalate of ammonium produces a white precipitate in water containing calcium salts.—8. Nitrate of silver occasions a cloudy white precipitate, insoluble in nitric acid, but soluble in ammonia, in water containing chlorine or chlorides.—9. Phosphate of sodium and ammonium (microcosmic salt), added to water that has been boiled, and precipitated by oxalic acid (if required), produces, in a few hours, a white precipitate, if the water contains magnesium salts.—10. Tincture or infusion of galls turns water containing iron black; when this takes place, both before and after the water has been boiled, the metal is present under the form of sulphate; but if it only occurs before boiling, then ferrous carbonate may be suspected, and will be precipitated as a reddish powder, by exposure to air and heat.—11. Ferrocyanide of potassium gives a blue precipitate in water containing a ferric salt, and a white one, turning blue by exposure to the air, in water containing a ferrous salt.—12. Sulphuretted hydrogen and the hydro-sulphates give a brown or black precipitate in water containing copper, iron, or lead; and a yellow precipitate in water containing arsenic, or its compounds.

Purif. Pure water is incapable of putrefaction, but ordinary water contains a small quantity of organic matter in solution, which speedily undergoes decomposition, even in closed vessels. This is especially the case with water kept in wooden casks, or in open cisterns into which leaves and insects are driven by the wind. Putrescent water is highly unwholesome as a beverage; and it is a fact, clearly demonstrated by the returns of the Registrar-General, that the last visitations of cholera corresponded in severity to the impurity of the water supplied to the respective districts.

Among the methods adopted for purifying foul water are the following:—1. Filtration through, or agitation with, coarsely powdered freshly burnt charcoal, either animal or vegetable, but preferably the former. This removes both mechanically suspended matter and part of the calcareous and gaseous impurities held in solution.—2. Free exposure to the action of the air, by which the organic matters become oxidised and insoluble, and speedily subside. This may be easily effected by agitating the water in contact with fresh air, or by forcing air through it by means of bellows.—3. The addition of a little sulphuric acid has a like effect; 15 or 20 drops are usually sufficient for a gallon. This addition may be advantageously made to water intended for

filtration through charcoal, by which plan at least $\frac{2}{3}$ of the latter may be saved. (Lowitz).—4. An ounce of powdered alum (dissolved), well agitated with a hog'shead or more of foul water, will purify it in the course of a few hours, when the clear portion may be decanted. When the water is very putrid, about $\frac{1}{2}$ dr. (or even 1 dr. per gal.) may be employed; any alum that may be left in solution may be precipitated by the cautious addition of an equivalent proportion of carbonate of sodium.—5. A solution of ferric sulphate acts in the same way as alum; a few drops are sufficient for a gallon.—6. Agitation with about the $\frac{1}{2}$ to 1 $\frac{1}{2}$ of finely powdered black oxide of manganese has a similar effect to the last.—7. The addition of a little aqueous chlorine, or chlorine gas, to foul water, cleanses it immediately. This method has the advantage of the water being perfectly freed from any excess of the precipitant by heat.—8. Sea water may be rendered fit for washing by the addition of a solution of carbonate of sodium or salt of tartar, as long as it turns milky. After repose, the clear portion must be decanted.—9. Sea water may be rendered fit for use as a beverage by distillation. The waste heat of the cook's galley is amply sufficient for this purpose. (There are several patent contrivances for the distillation of water on shipboard.)—10. Hard water may be softened in the same way as sea water.—11. Hard water may be both aerated and softened by the addition of a few grains of bicarbonate of potassium per gallon, followed by half as much lemon juice or tartaric acid as is sufficient to saturate the alkali in the carbonate thus added.—12. The hardness of water depending on the presence of carbonate of calcium ('temporary hardness'), including that of most rivers and many springs, may be nearly removed by ebullition; or, as recommended by Prof. Clark, by mixing the hard water with lime water in the proper proportions, when the calcium combines with the excess of carbonic acid, which previously rendered the carbonate soluble, and is precipitated as carbonate (chalk), together with the carbonate originally present. This method has been successfully carried out on the large scale.—13. Another method is to precipitate the lime by the addition of oxalate of ammonium in atomic proportion, carefully avoiding excess, and then to agitate the water with a little binoxide of manganese, in fine powder.—14. 'Permanently hard' water, that chiefly due to sulphate of calcium, may be softened by the addition of carbonate of sodium or wood-ashes.

Water, Quantitative Analysis of. The general quantitative analysis of potable waters is confined to the following: total residue; chlorine; hardness, temporary and permanent; nitrates, and nitrites, and nitrogenous organic matter.

Excess of chlorine is generally an indication of the presence of sewage, unless in the case of tidal waters; while nitrates and nitrites

are usually the result of the oxidation of decomposing organic matter; and therefore, likewise, indicate more or less contamination by sewage or decomposing animal matter. The nitrogenous organic matter is usually estimated as ammonia, urea, and albuminoid matter.

Unfortunately no decisive test for, or rather method of estimation of, the actually injurious organic matter has been discovered, not even a satisfactory proof of previous sewage contamination, but the fact of obtaining albuminoid ammonia, and the presence of an appreciable amount of nitrates or nitrites is generally sufficient ground for rejecting as suspicious a water, as if not absolutely injurious, at least liable to become so at any moment.

The hardness should be determined in the natural water, and after boiling it for one hour, replacing that lost by evaporation by distilled water. The second determination gives the permanent hardness of that due to sulphate of calcium, while the first determination is the total hardness, and minus the second gives [the temporary hardness, or that due to bicarbonate of calcium. Temporary hardness can be remedied by Dr. Clark's softening process, which consists in treating the water with milk of lime, which decomposes the soluble bicarbonates into carbonates, insoluble in water. Permanent hardness can be best removed for washing processes by the addition of carbonate of sodium, or by filtering the water through wood-ashes.]

Solid residue. One thousand grains of the water are evaporated down to dryness in a platinum dish over a water bath, and the residue heated to about 250 Fahr. for one hour. The increase in weight of the platinum vessel gives the total solid residue.

Hardness. One thousand measured grains of the water are run into a narrow-mouthed six or eight ounce stoppered bottle, well shaken and the air sucked out by means of a piece of glass tube. The standard soap solution is now run in a little at a time, shaking well between each addition, until a permanent lather is formed over the whole surface when the bottle is placed upon its side, and lasting for five minutes. The measure of soap solution used will indicate the hardness of the water by reference to Table A. Should, however, this not take place before 320 grain measures of soap solution have been added, a second trial must be made. One thousand grain measures of soap solution are placed in the bottle with a like amount of distilled water, and treated in the same manner as before. The amount of soap solution divided by two, will indicate half the hardness of the water. In the case of extremely hard water, where even 600 measures of soap solution gives no permanent lather, to every one thousand grains of the water twice that volume of distilled water must be added and the degree of hardness found by multi-

ing the degree corresponding to a third of the pure solution by three.

TABLE A.

Soap test measures corresponding to one thousand measures of water of each degree of hardness.

Degree of hardness.	Soap test measures.	Difference.
0	14	18

13	267	18
14	285	18
15	303	17
16	320	—

The soap test is made as follows:—Sixteen grains of pure carbonate of calcium (Iceland spar) are dissolved in pure dilute hydrochloric acid, and the whole cautiously evaporated to dryness over a water bath, redissolved in water and again evaporated to dryness. The resulting chloride of calcium, if perfectly neutral, is dissolved in one gallon of pure distilled water, and constitutes the standard water of "sixteen degrees of hardness." Good curd soap is dissolved in proof spirit, in the proportion of one ounce to the gallon. One thousand grains of the water of sixteen degrees of hardness are placed into a bottle, and this soap solution run in from a burette until a permanent lather is formed. The number of measures is noted, and the soap solution made up to such a strength that 320 grain measures produce a lather permanent for five minutes in 1000 grain measures of water of sixteen degrees of hardness.

Chlorine. Two thousand grains of the water are evaporated down to a little less than half an ounce in a platinum capsule over a water bath, and the bulk made up to 250 grains exactly with pure distilled water, a drop of neutral chromate of sodium solution is added, and a standard solution of nitrate of silver run in from a burette until a red colouration is produced. The number of grains of standard solution used multiplied by .0035 will give the grains of chlorine in one gallon of the water.

The standard solution is prepared by dissolving 33.53 grains of pure nitrate of silver in one gallon of distilled water.

Nitrates and Nitrites. The most convenient method is Messrs. Wanklyn and Chapman's modification of Schulze's. Two thousand grains of the water are placed in a retort, and half as

much of a solution of hydrate of sodium (of a strength of one in ten) added. Half the contents of the retort are distilled over, and the residue cooled. A piece of sheet aluminium is introduced into the solution and the whole allowed to stand several hours, the neck of the retort being closed by a cork (traversed by a tube moistened with hydrochloric acid and connected with a drying tube, if thought necessary). The neck of the retort (and tube) is then washed down with a little pure water, and the contents distilled over, down to about an ounce, into two or three ounces of water placed in the receiver. The contents of the receiver are made up to 2000 grains, and one half Nesslerised, as described further on. The amount of ammonia found multiplied by 259.2 gives the amount of nitrates, as nitric acid, in one gallon of the water.

Drs. Frankland and Armstrong have also described a method of estimating nitrates by the use of a special piece of apparatus, for which method we must refer the reader to the 'Journal of the Chemical Society' for March, 1868.

Nitrogen as Ammonia and Organic Matter. For the estimation of these Messrs. Wanklyn's and Chapman's is, for general use, the best and most convenient method. It depends on the conversion of the nitrogen of the nitrogenous organic matter into ammonia, and the employment of Nessler's test to estimate this ammonia.

Nessler's Reagent. 500 grains of iodide of potassium are dissolved in a small quantity of hot distilled water. Place this over a water bath, and add to it a strong aqueous solution of mercuric chloride, until the precipitate ceases to be dissolved as quickly as formed, when the addition of mercuric chloride is stopped. Filter, add to the filtrate 2000 grains of potassium dissolved in water, and dilute the volume to 10,000 grains. A little of the aqueous mercuric chloride solution is added, and the whole allowed to settle and the clear liquid decanted off.

Standard Ammonia Solution. Dissolve 27.164 grains of pure sulphate of ammonium in one gallon of distilled water. For use dilute 100 grains to 1000 grains. It will then contain 1 grain of ammonia in 100,000 of water.

In order to estimate ammonia, several tall glass cylinders, graduated at 1000 grains, and holding about six ounces, are employed. One of these is filled up to the graduation with the ammonia solution to be estimated, and about 30 grains of Nessler's reagent added from a pipette. The colouration produced is noted. A second cylinder is filled nearly to the mark with distilled water, and what is thought sufficient ammonia to produce a similar colour to the first run in, the whole made up to 1000 grains, and 80 grains of Nessler added; if after standing ten minutes, the colouration in the second is the same as in the first, the amount

of ammonia solution added is the same as in the water examined; but if this is not the case, a second trial must be added, using more or less standard ammonia as the intensity of colour is less or greater than the first. After a little experience more than two trials is rarely necessary.

Examination. Five thousand grains of the water to be analysed are placed in a tubulated retort, and half an ounce of a saturated solution of carbonate of sodium added. The contents are distilled over and every 500 grains collected separately, until 1000 or 1500 has passed over, when the next portion of 500 grains is Nesslerised; if it gives no reaction, the distillation is stopped; if it does, the distillation is continued until a portion of 500 grains ceases to. The ammonia in all these portions is estimated, making each portion of 500 grains up to 1000 with distilled water, and the total put down to ammonia, from ammonium salts and urea. The ammoniac from ammonium salts can be estimated by boiling 2000 grains of the water with carbonate of sodium for half an hour, making up the loss from evaporation, and by using some of this instead of distilled water in estimating the ammonia in 1000 grains of the original water, the amount of ammonia will be obtained. This subtracted from the total ammonia will give the ammonia from the urea, and multiplying by 1.76 will give the amount of urea.

To the retort after all the ammonia from the urea and has been driven off, one ounce of a solution of hydrate and permanganate of potassium, of a strength of 2000 grains of hydrate of potassium and 80 grains of permanganate to 10,000 grains of water, is added, and the distillation continued until no more ammonia comes over, collecting the distillate in portions of 500 grains as before. After estimation the total ammonia obtained must be put down to ammonia set free by the decomposition of nitrogenous organic, or albuminoid bodies. By multiplying the ammonia by ten, a fairly approximate weight of these substances will be obtained.

The following are some determinations of Professor Wanklyn. (Water Analysis.)

	Grains per gallon of Ammonia from	
	Urea and Salts.	Albuminoid bodies.
Thames, London Bridge	0.123	0.024
" Hampton Court	0.003	0.002
Well near East of London	2.800	0.210

Bishopsgate Street pump	0.525	0.018
Bala Lake	0.0007	0.017
Loch Katrine (Glasgow)	0.0003	0.006

Pres. Water is usually preserved on ship-board in iron tanks, or in casks well charred on the inside. It cannot be safely kept in copper

or leaden vessels, and receives a calcareous impregnation by contact with lime, mortar stucco, or stone containing lime. The addition to water of about $\frac{1}{2}$ to $1\frac{1}{2}$ of finely powdered black oxide of manganese materially promotes its preservation, especially at sea, where the motion of the vessel, and the consequent agitation of the water, increases the points of contact. Water never putrefies in iron vessels, or when some fragments of metallic iron are immersed in it. Distilled water should be preserved in stoppered glass bottles or carboys. See LOTION, SOLUTION, SPIRITS, WATERS (Distilled, Eye, Mineral, Perfumed, &c.), and the articles below.

Water, Barèges. *Prep.* Take of alum, carbonate of calcium, and hard Spanish soap, of each, 2 grs.; common salt, 4 grs.; dried carbonate of sodium, 20 grs.; sulphide of potassium, 16 grs.; water, 1 quart; boil them together until the fumes of sulphuretted hydrogen begin to be evolved, then add enough water to make up 1 gallon. *Used* as a medicated lotion or bath in cutaneous diseases, from the slightest eruption to the most obstinate cases of leprosy. 60 times the above quantity formed the medicated warm bath employed by the Emperor Napoleon. See WATERS (Mineral).

Water, Carrara. *Syn.* CARBONATED LIME WATER; AQUA CALCIS SUPERCARBONATIS, L. *Prep.* From lime water (professedly prepared from lime made by calcining Carrara marble), supersaturated by strong pressure with carbonic anhydride, so that the carbonate of calcium at first thrown down is redissolved. Each $\frac{1}{2}$ -pint bottle contains 8 to 10 grs. of carbonate of calcium.

Water, Chalybeated. *Syn.* AQUA CHALYBEATA, L. *Prep.* (Ure.) Ferrous sulphate, 3 grs.; bicarbonate of potassium, 61 grs.; cold rain or distilled water, 1 quart; mix, and agitate in a corked bottle. Possesses equal tonic powers to that of the springs, but it may be rendered pleasanter by forcing in a little carbonic acid gas. See WATERS (Mineral).

Water, Fly. *Prep.* From white arsenic 1 dr.; boiling water, 1 pint; dissolve, and sweeten the mixture with treacle. *Used* to kill flies. A dangerous method, and one that should never be adopted where there are children.

Water, Lime. See SOLUTION OF LIME.

Water, Lithia. From the freshly precipitated carbonate, as solution of magnesia. Antacid and antilithic.

Water, Potash. See SOLUTION.

Water, Rose. See WATERS (Distilled).

Water, Seidlitz. See POWDERS and WATERS (Mineral).

Water, Soda. Each bottle of this liquid should contain at least 15 grs. of carbonate of sodium, but that of the shops is usually nothing else but water highly charged with carbonic anhydride. Not a particle of soda enters into its composition, on which account it

ly, the carbon-
ater, and the corks so prepared that they
ill not impart their peculiar flavour to the
verage. See POWDERS, SOLUTION, and
FINES.

Water, Tar. See INFUSION OF TAR.

WATERS (Distilled). *Syn.* AROMATIC
ATERS, ODORIFEROUS W., PERFUMED W.;
QUÆ (Ph. L.), AQUÆ DESTILLATÆ (Ph. E. &
), L. Pure water, charged, by distillation,
ith the volatile, odorous, and aromatic
inciples of plants.

Prep. 1. (Ph. L.)—a. 2 galls. of water are
it into the still along with the vegetable
atter (bruised, if necessary), but only 1 gal.
drawn over. In the Ph. L. 1836, 7 fl. oz.
proof spirit were added before distillation.

b. Take of the essential oil of the plant,
fl. dr.; powdered silex, 2 drs.; triturate
ema-diligently together, and then with dis-
illed water, 1 gal., gradually added; lastly
after briskly agitating the whole for some
me), strain the solution.

2. (Ph. E.) As 1, a, but adding of rectified
pirit, 3 fl. oz., before distillation.

3. (Ph. D.) From the respective essences
Ph. D.), 1 fl. oz.; distilled water, 2 quarts;
gitated well together, and then filtered
rough paper.

The following are the AQUÆ DESTILLATÆ of
e British Colleges, with some others, the
uantities referring to a product of 1 gal., to
e prepared as above when not otherwise
irected.

ANGELICA WATER; AQUA ANGELICÆ (P.
od.), L. Bruised seed, 3 lbs.

ANISEED WATER; AQUA ANISI (Ph. D.), L.

BALM WATER; AQUA MELISSÆ (P. Cod.), L.
resh tops, 12 lbs.

BITTER-ALMOND WATER; AQUA AMY-
DALÆ AMARÆ, AQUA AMYGDALARUM AMA-
LARUM (P. Cod.), L. Bitter-almond cake
from which the oil has been expressed), 5 lbs.;
nacerate for 24 hours, and filter the distilled
product through paper previously wetted with
ure distilled water. Poisonous.—*Dose.* 10 to
0 drops, as a substitute for hydrocyanic acid.

BORAGE WATER; AQUA BOBAGINIS (P.
Cod.), L. Fresh leaves, 12 lbs.

CARAWAY WATER; AQUA CARUI (B. P., Ph.
& D.). Caraway, bruised, 1; water, 20;
listil 10.

CASCARILLA WATER; AQUA CORTICIS CAS-
CARILLÆ (P. Cod.), L. Cascarilla, bruised,
3 lbs.

CASSIA WATER; AQUA CASSIÆ (Ph. E.), L.
Cassia, bruised, 1½ lb.

CHERRY-LAUREL WATER; AQUA LAURO-
CERASI (B. P., Ph. E. & D.), L. *Prep.* 1.
(B. P.) Fresh leaves of common laurel, 16,

lavender, 8 fl. oz.; agitate well,
filter it (through wet paper—Ph. D. & P. Cod.).
—*Dose.* 10 to 60 drops, as a substitute for
hydrocyanic acid. It is commonly imitated
trade, by dissolving 75 drops (minims) of the
oil of bitter almonds in 2½ fl. oz. of rectified
spirit, agitating the mixture with warm dis-
tilled water, 1 gal., and filtering.

CINNAMON WATER; AQUA CINNAMOMI (P.,
Ph. L. E. & D.), L. 1. Cinnamon, bruised,
18 oz.; or oil, 2 fl. drs.—2. (B. P.) Cinnamon,
bruised, 1; water, 16; distil 8.

CLOVE WATER; AQUA CARYOPHYLLI (P.
Cod.), L. Cloves, bruised, 3 lbs.

DILL WATER; AQUA ANETHI (B. P., Ph.
& E.), L. 1. Bruised seed, 1½ lb.; or essential
oil, 2 fl. drs.—2. (B. P.) Bruised fruit, 1; water,
20; distil 10.

ELDER-FLOWER WATER; AQUA SAMBICI
(B. P., Ph. L. & E.), L. 1. Fresh elder flowers,
10 lbs.—2. (B. P.) Fresh elder flowers, sepa-
rated from the stalks, 1; water 2; distil 1

FENNEL WATER; AQUA FENICULI (B.
Ph. L. E. & D.), L. As DILL WATER.

HYSSOP WATER; AQUA HYSSOPI (P. Cod.)
L. Fresh tops, 12 lbs.

JUNIPER WATER; AQUA BACCÆ JUNIPER
